- 2(1). Peduncles rather densely hirtellous just below the umbel, mostly glabrous elsewhere *C. lemmonii*
- Peduncles not hirtellous just below the umbel, sometimes scabrous but then not more so just below the umbel than elsewhere 3
- 3(2). Plants strongly aromatic, from a branched more or less woody caudex, mostly clothed at the base with marcescent leaf bases and sometimes stem bases, often of rocky places; calyx teeth rather prominent, ca 0.5–1 mm long, acute, greenish (*Pteryxia* group) 4
- Plants not strongly aromatic, from fibrous taproots with simple or sparingly branched crowns, without or with few persisting leaf bases, not specific for rocky places; calyx teeth to ca 0.5 mm long, rarely acute . . . 5
- 4(3). Lowest pair of primary leaflets (1/4) 1/2–3/4 or more the length of the leaf blade, mostly 3–9 cm long, several times longer than the upper pairs, on petiolules 2–4 cm long; plants mostly of lower elevations *C. terebinthinus*
- Lowest pair of primary leaflets 1/4 or less the length of the leaf blade, to 2.7 cm long, often not more than twice as long as some of the upper pairs, sessile or on petiolules to 1 cm long; plants mostly of high elevations *C. hendersonii*
- 5(3). Involucre scarious, purplish or whitish with purple nerves, the bractlets mostly over 3 mm wide, sometimes united to midlength 6
- Involucre greenish or the bractlets very narrow and divided to the base or nearly so 8
- 6(5). Rays 1–3.5 cm long, usually at least some exceeding the well-developed to obsolete involucre, not obscured by the dense mature fruits; plants of the Colorado drainage *C. bulbosus*
- Rays 0.3–1 cm long, rarely longer, not exerted beyond the usually well-developed involucre; plants of the Great Basin and Colorado drainage 7
- 7(6). Lobes of involucels and usually of the involucres with more than 3 parallel purplish nerves extending to or near the tip; involucre sometimes reduced to a ring; plants of Kane and Washington counties *C. multinervatus*
- Lobes of involucels and involucres with a midnerve extending to the tip and sometimes 1 or 2 lateral shorter ones extending to near the middle; involucre present; plants widespread *C. purpurascens*
- 8(5). Involucre green and foliose, seldom scarious-margined, the bractlets 1.5–4 mm wide; plants obscurely viscid and with adhering grains of sand 9
- Involucre rarely wholly green, not foliose, often scarious-margined and/or the bractlets linear or narrowly elliptic and not over 1.5 mm wide; plants not viscid and with adhering sand grains 10

- 9(8). Leaves once ternate, the 3 leaflets ternately lobed or cleft, the blades with confluent portions 5–35 mm wide; outer rays 1–3.3 cm long; bractlets of involucrel entire or rarely tridentate; pseudoscape lacking; plants of the southern Utah *C. neuberryi*
- Leaves 2–3 times pinnate with 2 (3) opposite pairs of lateral primary leaflets, some rarely ternate, the blades with confluent portions 1–7 (12) mm wide, rays to 1.3 cm long; bractlets of the involucrel often with 2–3 teeth; pseudoscape often present; plants widespread *C. acaulis*
- 10(8). Rays obsolete or short and concealed in the very dense fruits of a globose headlike inflorescence; styles less than 1 mm long, or, if rays evident (to 17 mm long) and styles to 2 mm long, the leaves ternate, without a rachis, and with lobes sharply dentate-serrate; plants endemic in the Great Basin 11
- Rays short or rather long, not concealed in the dense inflorescence; styles mostly 1–3 mm long; leaves 2–3 times pinnate or, if ternate, usually with a rachis and the lobes not dentate-serrate; plants of broad distribution 13
- 11(10). Leaves pinnate, with 2–3 pairs of lateral primary leaflets, rarely some ternate, the blades narrowly ovate to oblong in outline; rays and pedicels obsolete; inflorescence a dense globose head; wings of fruit more or less spongy thickened; anthers white *C. globosus*
- Leaves ternate or occasionally simple and ternately cleft, the blades reniform, orbicular, to ovate in outline; rays and sometimes pedicels more or less evident when young, inflorescence various; wings of fruit papery; anthers yellowish or purplish 12
- 12(11). Leaves 2, opposite, rarely 3, the ultimate lobes crenate; pseudoscape solitary, subterranean; peduncles solitary; rays 3–10 mm long, hidden at maturity in the very dense globose headlike umbel; styles ca 0.4 mm long; plants of Juab, Sanpete, Sevier and Tooele counties *C. coulteri*
- Leaves often more than 2, the ultimate lobes dentate; pseudoscares or stems rarely solitary; peduncles 1–4 (6); rays 8–17 mm long, not hidden as above, the umbel not globose and headlike; styles 1.5–2 mm long; plants of Beaver and Millard counties *C. basalticus*
- 13(10). Pseudoscape rather quickly developing, (3.5) 5–24 cm long; leaf blades with 4–6 opposite or offset pairs of lateral primary leaflets; umbels sometimes nodding on recurved peduncles; petals white or yellow seldom turning light purple; plants mostly montane in central and western Utah 14
- Pseudoscape lacking or mostly subterranean, the aerial portion not over 3 cm long; leaf blades with 2–4 opposite pair of lateral primary leaflets, or ternate; umbels not nodding; petals white or yellow often turning dark purple 15
- 14(13). Leaves 3–pinnate, finely and completely dissected, with the ultimate segments the widest undivided portions of the blades, these to 2 mm long and to 1 mm wide; upper primary leaflets not tending to be confluent with the rachis; petals white; anthers purple; plants of western Utah *C. ibapensis*
- Leaves 2 (3)–pinnate, the ultimate lobes or teeth 1–5 mm long, 0.5–3 mm wide, these often not as wide as the confluent portions of the blade which are up to 12 mm wide; upper primary leaflets tending to be confluent with the rachis, and pinnatifid or only lobed; petals and anthers yellow or white; plants of northern and central Utah *C. longipes*
- 15(13). Leaves once pinnate with 2 opposite pairs of lateral primary leaflets, or a few ternate or rarely bitermate, glaucous, confluent portions of the blades (3) 6–25 (40) mm wide; petals and stamens bright yellow when fresh, fading to cream or white; plants of the Uinta Basin *C. duchesnensis*
- Leaves ternate or 2–3 times pinnately compound with up to 4 opposite pair of lateral primary leaflets, glaucous or not, the confluent portions mostly 1–4 mm wide or, if wider, the leaves ternate; petals yellow, purple, or white when fresh, if yellow, turning dark purple in age; plants of broad distribution 16
- 16(15). Petals creamy pink to pale purple when fresh, finally pale to moderately purple; rays 2–18 mm long; pedicels to 3 mm long; blades 1–3 cm long, pinnately dissected, the confluent portions rarely over 3 mm wide; plants scabrous, of Garfield, Iron, and Kane counties, at moderate to high elevations *C. minimus*
- Petals yellow or purplish when fresh, ultimately dark purple; rays, pedicels, and leaves mostly longer than above or the leaves mostly ternate with confluent portions often 5–21 mm wide; plants widespread *C. purpureus*
- Cymopterus acaulis* (Pursh) Raf.** Plains Spring-Parsley. [*Selinum acaule* Pursh]. Plants 5–18 (27) cm tall, from a simple or rarely branched, deep seated, nearly linear or slightly to much enlarged fibrous taproot; herbage often more or less viscid and dotted with sand grains; pseudoscares 1–2 (3) per plant, 0.5–5.5 cm long, often partly or wholly subterranean; leaves basal, or more often whorled and subtending the peduncles atop the pseudoscape, occasionally 1 or 2 on a stem, 2–3 times pinnate, with 1–3 opposite pairs of lateral primary leaflets; petioles 2–8 (11) cm long, blades (1) 2–5.5 (7) cm long, the confluent portions 1–7 (12) mm wide, oblong, ovate, to nearly linear in outline; primary leaflets 5–35 mm long, gradually reduced upwards, pinnate to bipinnatifid with few to several rounded to narrow lobes, the ultimate teeth or lobes to 10 (16) mm long and 2 mm wide; peduncles 1–14, (1.5) 3–14 (19) cm long; involucrel lacking; rays 6–9, 1–13 mm long; bractlets of the involucrel 3–8 (11) mm long, ca 1.5–4 mm wide, more or less united at the base, entire or with 2–3 teeth or lobes, green or purple in age, of the texture of the leaves; pedicels to 2 mm long; calyx teeth ca 0.2 mm long, greenish; petals white, yellow, or purple; stamens the color of the petals; styles ca 2.5 mm long; carpophore lacking; fruit 5–10 mm long, the wings slightly longer than the body, to 2 mm wide, slightly corky, some of the dorsal ones sometimes obsolete. There are 4 more or less intergrading varieties in the state.
1. Petals and stamens yellow when fresh, sooner or later fading to white or cream when dried 2
- Petals and stamens white or purple when fresh 3
- 2(1). Peduncles mostly shorter than the leaves, to ca 4 cm long; wings of the fruit mostly strongly wavy and often erose, to 7 mm long; leaf blades to ca 4 cm long; plants seldom over 7 cm tall, of the Great Basin *C. acaulis* var. *parvus*
- Peduncles equaling or exceeding the leaves, to 14 (19) cm long; wings of the fruit straight or slightly wavy, mostly entire or obscurely erose, to 10 mm long; leaf blades to 7 cm long; plants often over 7 cm tall, of the Colorado Basin *C. acaulis* var. *fendleri*

- 3(1). Petals and stamens purple; peduncles mostly exceeding the leaves; plants of Kane County *C. acaulis* var. *higginsii*
- Petals and stamens white; peduncles mostly shorter than or equaling the leaves; plants of the Uinta Basin *C. acaulis* var. *acaulis*

Var. *acaulis* Desert shrub, sagebrush, and juniper communities at 1432 to 1980 m in Duchesne and Uintah counties; Saskatchewan and Minnesota west to Oregon and south to Texas and northern Utah; 20 (v). Plants with white flowers grow among those with yellow flowers in the Uinta Basin where it is difficult if not impossible to recognize two taxa. Even when fresh the white flowers do not seem as bright as those of Wyoming, and the Uinta Basin materials seem transitional to var. *fendleri*.

Var. *fendleri* (Gray) Goodrich comb. nov. [based on: *C. fendleri* Gray Mem. Amer. Acad. II. 4: 56. 1849; *C. decipiens* Jones, type from Cisco, Grand County]. Desert shrub, blackbrush, sagebrush, and pinyon-juniper communities often on sandy soil at 1885 to 2890 m in Duchesne, Carbon, Emery, Garfield, Grand, Kane, San Juan, Uintah, and Wayne counties; Utah and Arizona; 74 (v). This taxon has long been recognized at specific level. The rather recent discovery of intermediate plants in the Uinta Basin and of other yellow flowered varieties (var. *parvus* from the Great Basin and var. *greeleyorum* Grimes & Packard of Oregon) greatly weaken the case for recognition at specific level.

Var. *higginsii* (Welsh) Goodrich [*C. higginsii* Welsh, type from north of Glen Canyon]. Desert shrub communities, often on sandy alluvium of Tropic Shale at about 1525 m in Kane County; endemic; 4 (0). The color of the petals persists as a bright purple long following collection.

Var. *parvus* Goodrich Desert shrub, sagebrush, and juniper communities, often on aeolian sand, at 1400 to 1585 m in Millard and Tooele counties; endemic; 15 (xii). This variety is similar to var. *acaulis* in the short scape, but differs in the yellow flowers. It is like var. *fendleri* in the yellow flowers, but differs in the short scapes. The plant is similar to extralimital var. *greeleyorum* Grimes & Packard in the short scape and yellow flowers. It is apparently most closely related to the latter taxon, from which it differs in the strongly undulate erose wings of the smaller fruit.

Cymopterus basalticus Jones Dolomite Spring-parsley. Plants 4–15 cm tall, from a taproot with simple or branched crown, glabrous, glaucous, with 1–few mostly etiolated, subterranean, short scapose stems; pseudoscape mostly lacking or, if present, short and enveloped in bladeless sheaths, the crown sometimes with a few marcescent leaf bases; leaves basal, (2) 3–9 per plant, ternately divided without a rachis, or occasionally simple and ternately cleft; petioles 1.5–5 cm long; blades 1–3.5 cm long, orbicular to reniform, the confluent portions 4–32 mm wide; leaflets 5–30 mm long, sessile, orbicular, ternately lobed, the major lobes again lobed, mostly ternately so, the ultimate lobes coarsely dentate; peduncles 1–4 (6) per plant, 3.5–8 (14) cm long; involucre lacking; rays 6–14, 8–17 mm long, usually evident in fruit; bractlets of the involucre 6–8, 2–5 mm long, more or less united at the base, white, pink, or purplish with white scarious margins; pedicels obsolete or nearly so; petals white or purplish; stamens yellowish or purplish; styles 1.5–2 mm long; carpophore lacking; body of fruit 3–6 mm long, the wings 4–7 mm long, 1–2 mm wide, whitish,

shrub communities, gravelly hills and alluvial fans mostly on dolomite, at 1705 to 1955 m in western Beaver (type from Wah Wah) and Millard counties; White Pine County; Nevada, a Great Basin endemic; 21(v). The orbicular to reniform leaf blades without a rachis are unique in the genus.

Cymopterus beckii Welsh & Goodrich Pinnate Spring-parsley. Plants 0–4 dm tall, glabrous, weakly if at all aromatic; caulescent, the leaves extending up the stem, from a taproot with a simple or sparingly branched crown, often clothed at the base with marcescent leaf bases; leaves 1- or 2-pinnate, with 2–3 opposite pairs of lateral leaflets, or the upper ones ternate; petioles 2–13 cm long; blades 2–10 cm long; leaflets 3–7, 0.5–4 cm long, or the terminal one to 5.5 cm long, 1–2 (3) mm wide, sessile, linear or linear-elliptic, entire or rarely a few bifid; peduncles 4–8 (19) cm long; umbels 1–3 per stem; involucre lacking; rays 6–11, 0.6–1.4 cm long; bractlets of the involucre ca 5, 1–5 mm long, to 1 mm wide, greenish or with narrow scarious margins, mostly separate; pedicels 1–3 mm long; petals and stamens bright yellow when fresh, fading whitish when dried; styles 1.2–2.2 mm long; carpophore weak, adhering to the mericarps; fruit 6–8 mm long, oblong, the lateral wings to ca 1 mm wide, the dorsal ones narrower, some often obsolete. Sandy or stony places, pinyon-juniper-mountain brush communities at 1700 to 2150 m in San Juan and Wayne (type from Fruita) counties; endemic; 8 (iv). The Beck spring-parsley is apparently closely allied to *C. lemmonii*, but differs in entire leaflets, glabrous peduncles and rays, and the slightly longer fruit.

Cymopterus bulbosus A. Nels. Onion Spring-parsley. Plants 8–27 cm tall, glabrous, glaucous, from a stout, thickened, often bulbous, fibrous taproot with a simple or sparingly branched crown; pseudoscape obsolete or 1–3, to 6.5 cm long and often partly or wholly subterranean, enveloped in dilated bladeless sheaths; leaves few to several, basal or whorled atop the pseudoscape with the peduncles, rarely 1 or 2 cauline, (1) 2–3 times pinnate, with (2) 3–6 opposite or offset pairs of lateral primary leaflets, the upper pairs often once-pinnate and more or less confluent; blades 2–10 cm long, ovate to oblong or nearly linear, confluent portions 1–5 mm wide, lowest pair of primary leaflets to 4 cm long, sessile or on petioles to 2 (5) mm long, the other primary leaflets progressively reduced upwards, the ultimate lobes and teeth 1–8 (12) mm long, ca 1–4 mm wide, more or less rounded; peduncles (1) 3–8 (11) per pseudoscape, 4–18 cm long; involucre obsolete or reduced to a ring or cup, or the bracts present and to 13 mm long, translucent, white, more or less united, with a green midrib and occasionally 1 or 2 lateral nerves that extend to ca 1/3 the length of the bract; rays 5–15, 1–3.5 cm long, usually exceeding the involucre; involucre 3–10 mm long, the bractlets more or less united at the base, similar in texture and color to the involucre, with a green center and midrib or the midrib sometimes purple, rarely with 1 or 2 lateral nerves extending to near midlength; pedicels 3–9 mm long; calyx teeth 0.5–1 mm long, scarious, white, like the involucre, with a green midrib to about midlength; petals white, sometimes purplish in age; stamens white, or purple especially in age; styles ca 2–4 mm long; carpophore divided to the base, more or less persistent on the pedicel after the mericarps have fallen; fruit 6–11 mm long, to 2 (3) mm wide, the wings (7) 9–13 mm long, 1.7–3 (4) mm

wide. Desert shrub and juniper communities at 1220 to 2005 m in the Colorado drainage in Carbon, Duchesne, Emery, Garfield, Grand, San Juan, Uintah, and Wayne counties; Wyoming to New Mexico and Arizona; 95 (xi). This species is similar to *C. purpurascens* (q. v.).

Cymopterus coulteri (Jones) Mathias Two-leaf Springparsley. [*C. corrugatus* var. *scopulicola* Jones, type from Sevier Bridge; *C. corrugatus* var. *coulteri* Jones; *Rhysopterus jonesii* Coult. & Rose, type from Juab]. Plants 4–11 cm tall, glabrous from a slightly to much enlarged fibrous taproot with simple crown, this giving rise to a solitary, mostly subterranean pseudoscape 2–6 cm long; leaves 2 (rarely 3 or 4 and the third and fourth ones usually smaller), opposite, borne at or near ground level, ternate or rarely simple and ternately cleft, petioles 1–3 cm long, blades 2–4 cm long, ovate to nearly orbicular in outline, confluent portions (5) 8–38 mm wide; leaflets 7–35 mm long, the lateral ones sessile mostly ternately lobed, the terminal on a winged more or less confluent rachis to 1 cm long, ternately cleft, the main lobes again lobed or crenate-toothed; peduncle solitary, 2–7 cm long; umbel globose, headlike, 1.5–5 cm across in pressed fruiting specimens; involucre lacking; rays 7–14 or perhaps more, 3–10 mm long, somewhat evident at anthesis, but hidden by the dense mature fruits; bractlets of the involucre 2–4 mm long, linear to narrowly ovate, green or purplish in age, often 3-nerved, with whitish or purplish scarious margins; pedicels shorter than the bractlets; calyx teeth minute but white and of the texture of the petals, deciduous; petals white; filaments white, anthers purple; styles (including the stigmas) ca 0.4 mm long; carpophore lacking; body of fruit 5–7 mm long, the wings 7–10 mm long, to ca 2 mm wide, papery; $n = 11$. Desert shrub, black sagebrush, and juniper communities, often on Arapien Shale and other clayey and gravelly barrens or semibarrens at 1540 to 1700 m in Juab, Sanpete, Sevier, and Tooele counties; endemic; 28 (vii). The strong tendency for plants to have only two leaves is unique in the genus.

Cymopterus duchesnensis Jones Uinta Basin Springparsley. Plants 7–23 cm tall, from a slender or more often enlarged bulbous taproot with simple or branched crown, glabrous and glaucous, not or weakly aromatic; stems short, often branched; pseudoscape lacking; leaves basal or 1–3 or more cauline, pinnate with 2 pairs of lateral leaflets, or occasionally a few ternate, or rarely biternate; petioles 2.2–11 cm long; blades (2) 3–10.5 mm long, ovate to oblong in outline, the confluent portions (3) 6–25 (40) mm wide; leaflets 1–5, on petiolules 2–32 mm long, ternately cleft or divided, the major lobes to 3 cm long, (3) 5–15 (20) mm wide, often again toothed or lobed and mostly ternately so, the ultimate teeth or lobes 1–8 mm wide; peduncles 1–3 per stem, 7–17 cm long; involucre lacking; rays 6–17, 1.5–4.4 cm long; bractlets of the involucre lacking or more often 1–7, 1–5 mm long, more or less united at the base, linear; pedicels (2) 4–9 mm long; petals and stamens bright yellow when fresh, fading to cream or greenish in herbarium specimens, not turning purple; styles 2–2.2 mm long; carpophore divided to the base, more or less persistent on the pedicel; body of fruit 5–9 mm long, the wings to 11 mm long, 2–2.5 mm wide, undulate to corrugated, more or less papery and not corky. Desert shrub, sagebrush, and juniper communities, sandy clay and clay semibarrens of Duchesne River,

Mancos Shale, Morrison, Uinta, and Wasatch formations at 1430 to 1860 m in Uintah and Duchesne (type from Myton) counties; Moffat and Rio Blanco counties, Colorado; a Uinta Basin endemic; 47 (xiii).

Cymopterus globosus (Wats.) Wats. Golfball Springparsley. [*C. montanus* var. *globosus* Wats.]. Plants 4–10 cm tall, from a slender or thickened fibrous taproot; pseudoscape (1) 2–6 cm long, all or nearly all subterranean, often loosely enveloped in dilated bladeless sheaths; leaves 1 or 2 atop the pseudoscape, and some usually arising directly from the fibrous root and then with etiolated subterranean petioles, pinnate or bipinnate and then trifid or pinnatifid, with 2–3 opposite pairs of sessile lateral primary leaflets, or rarely ternate; petioles 1.5–6 cm long; blades 2–5 cm long, narrowly ovate to oblong, confluent portions 5–10 mm wide, lowest pair of primary leaflets 10–18 mm long, the ultimate lobes to 4 mm long, to 2 mm wide, mostly toothed; peduncles 1 or 2, 3–6 cm long; involucre lacking; umbel a globose head, the rays and pedicels obsolete; involucre concealed in the dense flowers and fruits; petals white; stamens white; styles 0.5–0.8 mm long; carpophore lacking; body of the fruit ca 6 mm long, the wings ca 9 mm long, to 2.8 mm wide, wider towards the outside of the head, spongy thickened. Desert shrub communities at 1400 to 1525 m in Box Elder, Juab, Millard and Tooele counties; eastern California, Nevada, and western Utah; a Great Basin endemic; 6 (0).

Cymopterus hendersonii (Coult. & Rose) Cronq. Mountain Rock-parsley [*Pseudoteryxia longiloba* Rydb., type from the Abajo Mts.; *Pterixia hendersonii* (Coult. & Rose) Math. & Const.; *Pseudocymopterus hendersonii* Coult. & Rose]. Plants (3) 5–34 cm tall, glabrous, strongly aromatic, from a branched woody caudex, clothed at the base with old petiole and peduncle bases, these sometimes persisting for a few or several years without shredding; leaves basal, bipinnate or occasionally partly tripinnate with 5–10 opposite or offset pairs of lateral primary leaflets, petioles (1) 2–14 cm long, blades (1) 1.5–10 cm long, oblong in outline, finely dissected so that the ultimate segments are the widest undivided parts of the blade, the lowest pair of primary leaflets less than 1/4 as long as the leaf blade, 5–27 mm long, sessile or on petiolules to 1 cm long, upper primary leaflets gradually reduced, the ultimate segments 1–12 mm long, 0.3–1.4 mm wide, acute, with a usually whitish tiny mucro; peduncles 7–30 cm long; umbels compact; involucre lacking; rays 6–16, 0.5–2.4 cm long, the inner ones shorter than the outer ones and often abortive; bractlets of the involucre 2–6, 2–10 mm long, linear, acute; pedicels 1–5 mm long; calyx teeth ca 1 mm long, persistent in fruit, greenish, often reddish tinged, acute; petals and stamens bright yellow when fresh, fading whitish in herbarium specimens; styles to 2 (2.5) mm long; carpophore divided to the base; fruit 4–8 mm long, the wings to ca 1 mm wide, some of the dorsal ones sometimes obsolete. Talus, cliffs, ledges, rocky spruce-fir, limber pine, and alpine communities at (2285) 2740 to 3660 m in Beaver, Box Elder, Cache, Daggett, Duchesne, Grand, Juab, Piute, Salt Lake, San Juan, Sevier, Summit, Tooele, Uintah, and Utah counties; southwestern Montana and central Idaho, south to New Mexico; 66 (x).

Cymopterus ibapensis Jones Ihapah Springparsley. [*C. watsonii* (Coult. & Rose) Jones]. Plants 7–25 cm tall, glabrous or granular-scarious, not or weakly aromatic,

from a linear taproot, this hardly if at all swollen, with a simple or occasionally branched crown; pseudoscapas 1 or 2 (5) per root, the aerial portion 3.5–10 cm long, commonly enveloped at the base by scarious dilated bladeless sheaths; leaves whorled atop the pseudoscape, rarely some arising directly from the root, tripinnate, with 5–6 opposite or offset pairs of lateral primary leaflets; petioles (1) 1.5–3.5 cm long; blades (2.5) 4–11 cm long, ovate in outline, completely dissected so that the ultimate segments are the widest undivided portions of the blade; lowest pair of primary leaflets $1/2$ – $3/4$ as long as the leaf blade, sessile or on petiolules to 2 cm long, with 4–6 (8) opposite or offset pairs of secondary leaflets, the ultimate segments to 2 mm long, to ca 1 mm wide; peduncles (2) 4–8 per pseudoscape, 2–15 cm long; umbels and peduncles occasionally nodding or recurved; involucre lacking; rays 10–18, 5–20 mm long; bractlets of the involucre to 4 mm long, to 0.5 mm wide, distinct or nearly so, green with a purple midrib and narrow scarious margins; pedicels 4–6 mm long; calyx teeth to 1 mm long, greenish; petals white; filaments white, the anthers purple; styles 1–2 mm long; carpophore divided to the base; body of fruit 5–8 mm long, the wings 6–9 mm long, to 2 mm wide, some of the dorsal ones sometimes reduced. Greasewood-sagebrush, sagebrush-grass, and pinyon-juniper communities at 1520 to 2755 m in Beaver, Box Elder, Iron, Millard, Piute, either or perhaps both Juab and Tooele (type from Deep Creek Valley), and Washington counties; southeastern Oregon, and Nevada; 30 (viii).

Cymopterus lemmonii (Coul. & Rose) Dorn Lemmon Spring-parsley. [*Pseudocymopterus lemmonii* (Gray) Coul. & Rose; *P. montanus* (Gray) Coul. & Rose; *P. tidestromii* Coul. & Rose, type from Mt. Terrill, Sevier County; *P. versicolor* Rydb., type from Aquarius Plateau; *Thaspium montanum* Gray; *Ligusticum montanum* (Gray) Gray]. Plants 8–50 cm tall, glabrous except on the peduncle and in the inflorescence, not or weakly aromatic, from a taproot with simple or branched crown, more or less clothed at the base with shredded persisting leaf bases; pseudoscape lacking; leaves basal and sometimes 1 or 2 cauline ones on the lower $1/3$ of the stem or 1 above the middle, mostly bipinnate and then often bifid or pinnatifid in the lower part, with 2–4 opposite or offset pairs of lateral primary leaflets, rarely pinnate in part with entire leaflets; petioles 1–13 cm long, dilated basally; blades (1) 2–8 cm long, confluent portions to 4 mm wide; lowest pair of primary leaflets $1/4$ – $2/3$ as long as the leaf blade, sessile or on petiolules to 15 mm long, the ultimate segments 2–20 mm long, linear or narrowly elliptic; peduncles 1–9, (4) 9–28 cm long, rather densely hirtellous below the umbel; involucre lacking or rarely of 1 or 2 small bracts; rays (5) 9–18, 0.8–2.5 cm long, glabrous, scabrous or hirtellous; bractlets of involucre 5–11, to 5.5 mm long, linear or narrowly elliptic, separate or united at the base, green or sometimes with a scarious or purplish margin; pedicels obsolete or to 2 mm long; calyx teeth less than 0.5 mm long, deciduous; petals and stamens bright yellow when fresh, pale or purplish in age; styles ca 2 mm long; carpophore apparently lacking to well developed and divided to the base; fruit mostly 3–6 mm long, the wings ca 1.5 mm wide, some of the dorsal ones sometimes obsolete; $n = 11$. Grass-forb, aspen, Douglas fir, and spruce-fir communities, and windswept ridges and raw escarpments especially in limestone, at 2375 to 3600 m in Beaver, Emery, Garfield, Grand, Iron, Piute, San Juan,

Sanpete, Sevier, Washington, and Wayne counties; southeastern Wyoming to Arizona and Mexico; 138 (vii). Occasional specimens have been confused with *Lomatium juniperinum*.

Cymopterus longipes Wats. Long-stalk Spring-parsley [*Peucedanum lapidosum* Jones, type from Echo, Summit County; *C. lapidosus* (Jones) Jones; *Lomatium lapidosum* (Jones) Garrett; *C. lapidosus* var. *deserti* Jones]. Plants 7–30 (50) cm tall, glabrous, not aromatic, from a thickened fibrous taproot with a simple or sparingly branched crown; pseudoscapas 1–3, 4–24 cm long, mostly aerial, or partially subterranean, more or less enveloped by dilated bladeless sheaths; leaves whorled atop the pseudoscape, rarely any rising from the fibrous root, 1–3 times pinnately compound, with mostly 4–6 opposite or offset pairs of lateral primary leaflets, the upper pairs often more or less confluent and merely pinnatifid, petioles 1–5 cm long, blades 3–8.5 cm long, oblong to ovate in outline, the confluent portions 2–12 mm wide; lowest pair of primary leaflets 1–5 cm long, sessile, or on petiolules to 5 mm long, the ultimate lobes or teeth 1–5 mm long, 0.5–3 mm wide; peduncles 3–18 per pseudoscape, 4–24 cm long; umbels and peduncles sometimes nodding or recurved; involucre lacking; rays 4–11, 0.5–3.3 cm long; bractlets of the involucre to 7 mm long and less than 1 mm wide, mostly separate, green with narrow scarious margins; pedicels 1–12 mm long; calyx teeth 0.2–0.5 mm long; petals yellow or white when fresh, when yellow fading to white in herbarium specimens; stamens colored like the petals; styles ca 2 mm long; carpophore divided to the base; body of the fruit 4–6 mm long, the wings 5–8 mm long, 1–2 mm wide. Sagebrush-grass, pinyon-juniper, and mountain brush communities at 1340 to 3155 m in Box Elder, Cache, Carbon, Daggett, Davis, Duchesne, Juab, Morgan, Rich, Salt Lake (type from near Salt Lake City), Sanpete, Summit, Tooele, Uintah, Utah, Wasatch, and Weber counties; Idaho and Colorado; 160 (xxi). White flowered specimens are common in the Bear River Range and occasional to the central part of the Wasatch Range. The yellow petals of more southern specimens turn whitish in the herbarium, and the ranges of the two color variants are difficult to determine from herbarium specimens. Other than the color difference, there seems to be no way to tell the phases apart. A third phase, in which the fruits are like a *Lomatium* (dorsal ribs not or scarcely winged), apparently has white flowers. This phase, known from Summit County, is referable to *C. lapidosus* (Jones) Jones and may be worthy of the specific status given it by Jones. More work is indicated.

Cymopterus minimum (Mathias) Mathias Least Spring-parsley. [*Aulospermum minimum* Mathias, type from Cedar Breaks, Iron County]. Plants 3–10 (10) cm tall, acaulescent, scabrous, from a slender to much enlarged often deep-seated taproot, with few to several frequently soboliferous branches; stems mostly subterranean and etiolated; pseudoscapas lacking or short and below ground; leaves 2–3 times pinnately dissected, with 3–4 opposite pairs of lateral primary leaflets, petioles 0.5–2 cm long or sometimes much longer with etiolated subterranean portions, blades 1–3 cm long, the confluent portions 1–6 (10) mm wide, the primary leaflets sessile or the lowest pair on petiolules to 0.5 cm long, the ultimate segments to 3 mm long, to ca 2 mm wide; peduncles 1.5–14 cm long; rays of the umbel mostly 5–10, 2–18 mm long; bractlets of the involucre ca 3–4, 2–4 mm wide;

pedicels lacking or to 3 mm long; calyx teeth minute or lacking; petals cream pink or pale purple (reputedly white) with whitish margins or with moderately purple markings in herbarium specimens; stamens whitish; styles ca 2 mm long; carpophore divided to the base; fruit 4–8 mm long, the wings to 1 mm wide. Ponderosa pine, bristlecone pine, spruce-fir, and perhaps pinyon-juniper communities at (2190) 2440 to 3170 m in Garfield, Iron, and Kane counties; endemic; 23 (i). Occasional specimens are intermediate to *C. purpureus* and more work is needed to establish the range of the small plants with cream pink or pale purple petals. These plants have been mistaken for *C. purpureus* var. *rosei* and they are similar in the short rays, short pedicels, small fruit, small leaves, and in scabrosity, but the leaves are not ternate, and they are more finely dissected than those of *C. purpureus* var. *rosei*. In some features of the leaves and in distribution this taxon is more closely allied with *C. purpureus* var. *purpureus*. At the extreme (Cedar Breaks) these plants are very different, but through a series of recent collections from the Markagunt, Paunsaugunt, and Table Cliff plateaus, and Escalante Mts., a rather close relationship to *C. purpureus* var. *purpureus* is evident. Perhaps this is only a part of the *C. purpureus* complex, and could be treated as a variety, but no such combination is proposed herein. The color of the petals seems to be diagnostic.

Cymopterus multinervatus (Coul. & Rose) Tidestr. Purple-nerved Spring-parsley. [*Phellopterus multinervatus* Coul. & Rose]. Plants 10–15 cm tall, glabrous and glaucous, from a linear or slightly to much enlarged fibrous taproot; pseudoscares lacking or solitary, to 7.5 cm long, partly or mostly subterranean, often enveloped by dilated, scarios bladeless sheaths; leaves basal or whorled, with the peduncles atop the pseudoscape, 2–3 times pinnately compound, with 3–5 opposite pairs of lateral primary leaflets; petioles 1–7.5 cm long; blades 1–7 cm long, ovate in outline, lowest pair of primary leaflets to 4.5 cm long, sessile or on petiolules to 5 mm long, the ultimate lobes to 4 (7) mm long, to 2 mm wide, sometimes with small rounded teeth; peduncles 1–8, 4–10 cm long; involucre to 1 (1.5) cm long, the bracts more or less united, sometimes forming a cup or reduced to a ring, greenish basally and centrally, with broad, white scarios margins, and with many purplish almost parallel nerves; rays (3) 5–11, 0.3–1 cm long, obscured by the dense fruits, included in or exerted beyond the involucre; involucels 5–10 mm long, like the involucre in color, texture, and venation, but never reduced to a ring; pedicels to ca 4 mm long, included in the involucel; calyx teeth 0.5–1 mm long or somewhat enlarged and simulating the involucre; petals white or purple; stamens white or purple; styles 2–3 (4) mm long; carpophore lacking; body of the fruit 7–10 mm long, the wings 12–13 mm long, 5–7 mm wide. Desert shrub and sagebrush communities at 1220 to 1525 m in Kane and Washington counties; California to Texas and Mexico; 7 (0).

Cymopterus newberryi (Wats.) Jones Sweetroot Spring-parsley. [*Peucedanum newberryi* Wats.; *Coloptera jonesii* Coul. & Rose, type from Milford]. Plants 7–18 cm tall, sparingly viscid and often dotted with adhering sand grains, from a slender to tuberous taproot with simple or rarely branched crown; pseudoscape lacking; leaves arising directly from the root crown, ternate, rarely simple and ternately cleft; petioles 3.5–10.5 cm long, (1.6) 2.5–5 times as long as the blades, often partly

subterranean, blades 1–4 (5.5) cm long, confluent portions 5–35 mm wide; leaflets 1–3.5 cm long, mostly ternately cleft or divided, the major lobes again lobed or toothed, the ultimate lobes or teeth to 6 mm long and 5 mm wide; peduncles 1–10, 5–17 cm long, often partly subterranean; involucre lacking; rays 5–16, the central ones often greatly reduced or obsolete, the outer ones 1–3.3 cm long; bractlets of the involucels 3–12 mm long, to 3 mm wide, entire, green, or sometimes purplish in age, with texture of the leaves; pedicels ca 1 mm long; calyx teeth ca 0.5 mm long, deciduous; petals and stamens yellow when fresh, fading to cream or greenish in age; styles 2–3 mm long; carpophore lacking; body of fruit 5–8 mm long, the wings 6–10 mm long and 1.5–1 mm wide, more or less corky, some of the dorsal ones obsolete. Desert shrub, blackbrush, sand sagebrush, desert grassland, and juniper communities, mostly on very sandy soil, at 850 to 1830 m in Beaver, Garfield, Grand, Kane, Millard, San Juan, Washington, and Wayne counties; Arizona; 47 (x).

Cymopterus purpurascens (Gray) Jones Widewing Spring-parsley [*C. montanus* var. *purpurascens* Gray]. Plants 5–15 cm tall, glabrous and glaucous, from a mostly tuberous root with simple or sparingly branched crown, this usually with few to several persistent shredded leaf bases; pseudoscares lacking or to 3 per plant and to 6 cm long, mostly subterranean, usually enveloped by scarios dilated bladeless sheaths; leaves basal or more or less whorled atop the pseudoscape, 2–3 times pinnately compound, with 3–6 opposite pairs of lateral primary leaflets, the pairs gradually reduced upwards; petioles 0.6–5 cm long, sometimes longer including etiolated subterranean portions; blades 1.2–7 cm long, oblong to ovate in outline, confluent portions to 3 (5) mm wide, lowest pair of primary leaflets (0.4) 1–2 (4) cm long, sessile or on petiolules to 3 mm long, the ultimate lobes or teeth rounded, mostly with narrow-scarios margins; peduncles 1–3 per pseudoscape, 3–9 cm long; involucre 8–14 mm long, more or less united at the base and sometimes to about midlength, whitish, scarios, the lobes with a greenish or purplish midnerve extending to the tip, and usually 1 or 2 parallel lateral much shorter nerves; rays ca 4–7, rarely longer than 1 cm, mostly shorter than the involucre, hidden in the dense broadly winged fruits; involucels like the involucre but shorter (ca 5–7 mm) and usually with the lateral nerves over 1/2 as long as the midnerve, the nerves occasionally branched; pedicels to 5 mm long, mostly concealed in the involucels and in the dense fruits; calyx teeth less than 0.5 mm long, rounded; petals white or purplish with a green or purplish midvein; filaments white, the anthers purple; styles ca 2 mm long; carpophore lacking or filiform and very thin, not persisting on the pedicel; body of fruit 6–11 mm long, the wings 9–16 mm long and 3–6.5 mm wide. Desert shrub, sagebrush, pinyon-juniper, bullgrass, and ponderosa pine communities, on aeolian sand to heavy clay at 1065 to 2745 m in all Utah counties except Daggett, Davis, Grand, Morgan, Rich, Sunmit, Wasatch, and Weber; southeastern Idaho to southeastern California and northwestern New Mexico; 106 (xxi). *Cymopterus purpurascens* is often confused with *C. bulbosus*, but that species has mostly 1-nerved lobes of the involucre and involucel, the involucre is sometimes reduced to a ring or cup, the plants flower later (often a month or so), and it is confined to lowlands mostly in heavy soil. Rare specimens (Neese

7169 and Thorne et al. 1707) show the broad wings of fruit typical of *C. purpurascens*, have rays well over 1 cm long that are exerted beyond the involucre, and at least some of the fruits have a well developed carpophore. Perhaps these specimens indicate hybridization of these two taxa.

***Cymopterus purpureus* Wats.** Variable Spring-parsley. Plants 5–26 cm tall, from a slender to tuberous root with a simple or branched crown; stems solitary to several, arising at or just below ground level; pseudoscape lacking, or less than 2 cm long and then usually mostly subterranean; leaves basal or nearly so, ternate or (1) 2–3 times pinnately compound, with up to 4 opposite pairs of lateral primary leaflets; petioles 1–7 cm long; blades 1.5–13 cm long, mostly ovate in outline, the lowest pair of primary leaflets mostly over 1/2 and to 3/4 as long as the leaf blade, sessile or on petiolules to 32 mm long, the ultimate lobes or teeth acute or rounded; peduncles 1–5, 3–21 cm long; involucre lacking; rays 5–22, 0.2–9.5 cm long; bractlets of the involucre 4–8, 2–4 mm long, separate or united at the base, acute to acuminate, entire; pedicels 1–10 mm long; calyx teeth less than 0.5 mm long, deciduous; petals yellow when fresh, drying dark purple in age; stamens yellow when fresh, remaining yellowish or cream or at least pale in age; styles 2–3 mm long; carpophore divided to the base; body of fruit ca 4–8 mm long, the wings 5–10 (12) mm long, 1.5–4 mm wide, often marked with purple. With 3 more or less intergrading varieties in the State.

1. Fruiting rays 5–8 (15), 0.2–2 (3) cm long; fruiting pedicels 1–5 (7) mm long; wings of fruit 5–8 mm long, to 2 mm wide; leaf blades mostly ternate; plants of lower to midmontane areas, mostly of central Utah *C. purpureus* var. *rosei*
- Fruiting rays (8) 12–22, (2) 2.5–7 (9.5) cm long; fruiting pedicels 5–10 mm long; wings of fruit 8–10 (12) mm long, (2) 2.5–4 mm wide; leaf blades pinnately compound, rarely ternate; plants of deserts and lower montane, widespread 2
- 2(1). Some wings of fruit apparently thickened and spongy; ultimate teeth of leaves acute; plants conspicuously glaucous, of Beaver, Iron, and Washington counties . . . *C. purpureus* var. *jonesii*
- Wings of fruit mostly thin and papery; ultimate teeth of leaves acute to rounded; plants not conspicuously glaucous, not of the above counties except Washington . . . *C. purpureus* var. *purpureus*

Var. *jonesii* (Coul. & Rose) Goodrich [*C. jonesii* Coul. & Rose, type from Frisco, Beaver County; *Aulospermum jonesii* (Coul. & Rose) Coul. & Rose]. Sagebrush, pinyon-juniper, and mountain brush communities at 1520 to 1905 m in Beaver, Iron, and Washington counties; Nevada; a Great Basin endemic; 10 (i).

Var. *purpureus* Desert shrub, sagebrush, pinyon-juniper, mountain brush, ponderosa pine, and rarely aspen-fir communities in sandy to heavy clay soils at 1100 to 2375 (2880) m in Carbon, Duchesne, Emery, Garfield, Grand, Kane, San Juan, Uintah, Washington, and Wayne counties; eastern and southern Utah, western Colorado, northern Arizona, and northwestern New Mexico; 134 (v). Specimens with rather broad leaflets from the Uinta Basin (Neese et al. 7273, and White and Neese 123) indicate a close relationship to and possible hybridization with *C. duchesnensis*.

Var. *rosei* (Jones) Goodrich [*Aulospermum rosei* Jones in Coul. & Rose., type from Richfield; *C. rosei* (Jones)

Jones]. Pinyon-juniper, sagebrush, mountain brush, bull grass, limber pine, white fir, and rarely desert shrub communities, in marly limestone, shaley slopes, and clay or sandy-clay soils, at 1615 to 2290 (2650) m in Duchesne, Juab, Millard, Sanpete, Sevier, and Wasatch counties; endemic to central Utah; 28 (x).

***Cymopterus terebinthinus* (Hook.) T. & G.** Rock Parsley. [*Selinum terebinthinum* Hook.; *Pteryxia terebinthina* (Hook.) Coult. & Rose]. Plants (12) 15–35 (40) cm tall, glabrous, strongly aromatic, from a heavy subliguous root and a branched caudex, the caudex clothed with marcescent non-shredded leaf bases; pseudoscape lacking; leaves basal and often 1–3 on the lower part of the stem, mostly 2–4 times pinnately or ternate-pinnately compound, with (4) 6–10 opposite or offset pairs of lateral primary leaflets, petioles 2–13 cm long, blades 1.5–14 cm long, finely and completely dissected so that the ultimate segments are the widest undivided part of the blade, the lowest pair of primary leaflets mostly 3–9 cm long, (1/5) 1/2–3/4 as long as the leaf blade, on petiolules 2–4 cm long, the ultimate segments 1–5 (7) mm long, 0.5–1 (1.5) mm wide; peduncles 10–34 cm long; involucre lacking; rays 7–13, 0.7–5 (8) cm long; bractlets of the involucre (0) 1–5, 2–5 mm long, separate or united at the base, linear or linear-subulate; pedicels 2–5 (10) mm long; calyx teeth 0.5–0.9 mm long, acute, rather persistent; petals and stamens bright yellow when fresh, fading whitish and rarely yellow for more than 2 years in herbarium specimens; fruiting styles (2–5) 3–4 mm long, mostly curved or coiled; carpophore divided to the base, persisting on the pedicel; body of fruit 5–8 mm long, the wings 6–9 mm long, 0.5–1.5 (2.5) mm wide, some of the dorsal ones often reduced or obsolete. There are two varieties in Utah.

1. Lateral pairs of primary leaflets all longer than their internodes; lowest pair of primary leaflets with the lower secondary leaflets sometimes petiolulate; plants of the Uinta Basin and northern Utah *C. terebinthinus* var. *calcareus*
- Upper 4–6 pairs of lateral primary leaflets equal or shorter than their internodes; lowest pair of primary leaflets with sessile secondary leaflets; plants of eastern Utah south of the Uinta Basin *C. terebinthinus* var. *petraeus*

Var. *calcareus* (Jones) Cronq. [*Cymopterus calcareus* Jones]. Desert shrub, sagebrush, pinyon-juniper, and mountain brush communities, often in talus, colluvium, and crevices of rock outcrops at 1445 to 2320 (2560) m in Box Elder, Cache, Daggett, Juab, Rich, and Uintah counties; Montana to Colorado, and west to southern Idaho and northeastern Nevada; 36 (vii). Some of the Uintah County materials are transitional to plants of var. *petraeus*. Plants of var. *calcareus* are very similar to those of var. *albiflorus* (T. & G.) Jones, from Montana and Wyoming, which were originally described as having white flowers. Dried flowers soon turn white or whitish in all of the *C. terebinthinus* complex, and the two varieties are both reported from the same regions of Montana and Wyoming. Unfortunately, the misnomer var. *albiflorus* has priority by many years, and our plants might belong to that taxon.

Var. *petraeus* (Jones) Goodrich Skeletonleaf Rockparsley. [*C. petraeus* Jones]. Desert shrub, blackbrush, and pinyon-juniper communities, often in talus, collu-

vium, crevices of rock outcrops, and in sandy to clayey soil at 1400 to 2075 m in Emery, Grand, and San Juan counties; Nevada, Idaho and Arizona; 16 (i).

Daucus L.

Annual or biennial caulescent herbs from taproots; leaves pinnately dissected; umbels compound; involucre of pinnatifid bracts or lacking; involucre of toothed or entire bracts or lacking; calyx teeth evident to obsolete; petals white or those of the central flower of the umbel or umbellet often purple or rarely all the flowers pink or yellow; stylopodium conic; carpophore entire or bifid at the apex; fruit oblong to ovoid, slightly compressed and evidently ribbed dorsally, with 2 ribs on the commissure, beset with stout spreading glochidiate or barbed ribs.

1. Plants biennial, cultivated or established, widespread; bracts of the involucre mostly pinnatifid into mostly entire rather rigid elongate segments *D. carota*
 — Plants annual, native, not cultivated, known from the Virgin Narrows in Arizona, to be expected in Washington County; bracts of the involucre pinnatifid into often lobed or toothed nonrigid segments *D. pusillus* Michx.

Daucus carota L. Carrot. Plants 6–10 dm tall, from a taproot; herbage glabrous or hirsute; leaves in rosettes and cauline, mostly 1–2 times pinnate and then pinnatifid, with ca 4–9 opposite or offset pair of lateral primary leaflets, basal and lower cauline petioles to 15 cm long, basal and lower blades 5–15 cm long or more, the upper ones reduced and sessile on dilated sheaths, the lowest pair of primary leaflets 1/3–1/2 as long as the leaf blade, on petiolules 4–15 mm long, ultimate segments 1–10 mm long, 0.5–2 mm wide, elliptic, narrowly deltoid, or linear, often acute; peduncles mostly 8–30 cm long; umbels 4–10 or more; involucre of pinnatifid bracts 1–5 cm long, the segments linear and narrow; rays ca 15–60 or more, (0.5) 1–6 cm long; involucre similar to the involucre but smaller, or the bractlets entire, 2–16 mm long; fruit 3–4 mm long, bristly hirsute in rows, the hairs or bristles ca 2 mm long, minutely glochidiate apically, the intervals often with shorter simple hairs; $2n = 18$. Cultivated in all counties of the state, or widely established; introduced from Eurasia; 16 (iv). The wild plants (ssp. *carota*) differ from the cultivated plants [ssp. *sativus* (Hoffm.) Arcangelii] primarily in the size and flavor of the root.

Foeniculum Adanson

Biennial or perennial, caulescent herbs with strong odor of anise, glabrous, glaucous, from a taproot; leaves pinnately dissected with filiform ultimate segments; umbels compound; involucre and involucre lacking; calyx teeth obsolete; petals yellow; stylopodium conic; carpophore divided to the base; fruit oblong, subterete, or slightly compressed laterally, with prominent ribs.

Foeniculum vulgare Miller Sweet Fennel. Short-lived perennial herbs 0.5–2 m tall, from a taproot; stems solitary, branched above; leaves to 3 times ternate-pinnately compound with 6–9 opposite pair of lateral primary leaflets; petioles to 15 cm long, rather abruptly expanded into a dilated sheathing base or lacking and blades arising directly from the sheath; larger blades to 30 or 40 cm long, ovate in outline, finely and completely dissected, the elongated filiform ultimate segments 4–40 mm long and less than 1 mm wide, the lowest pair of primary leaflets on petiolules often over 2 cm long; peduncles 1.5–6.5 cm

long; umbels several; rays 10–40, 2–8 cm long; petals yellow; styles 0.3–0.4 mm long; fruit 3.5–4 mm long; $n = 8, 11, 13, 15, 22$. Roadsides and waste places at 850 to 1465 m in Utah and Washington counties; introduced from Europe, now widespread in much of the U. S.; 3 (0).

Heracleum L.

Biennial or perennial herbs from tap or fascicled fibrous roots; leaves ternately or pinnately compound, with broad toothed or cleft leaflets; umbels compound; involucre lacking or of a few deciduous bracts; involucre lacking or of slender bractlets; flowers of the marginal umbellets generally irregular, the outer petals enlarged and often deeply bilobed; calyx teeth obsolete or minute; stylopodium conic; carpophore divided to the base; fruit orbicular to obovate or elliptic, strongly flattened dorsally, usually pubescent, the dorsal ribs narrow, the lateral ribs broadly winged.

Brummit, R. K. 1971. Relationship of *Heracleum lanatum* Michx. of North America to *H. sphondylium* of Europe. *Rhodora* 73: 578–584.

Heracleum lanatum Michx. Cow parsnip. [*H. sphondylium* ssp. *lanatum* (Michx.) Love & Love]. Stout single-stemmed perennial herbs 8–25 dm tall, from a taproot or cluster of fibrous roots, glabrate or thinly to densely villous or villous-hirsute below to villous-woolly above especially on the nodes; leaves ternate or the upper ones simple, petioles to 25 cm long or longer, or lacking on upper leaves with the petiolules and rachis arising directly from a dilated sheath, blades to 40 cm long or longer, ovate to orbicular; leaflets 8–36 cm long or longer, ovate to orbicular, usually with 3 major lobes that are again lobed and coarsely toothed; peduncles 5–24 cm long; involucre lacking or of few mostly linear entire bracts to 2 cm long; rays 12–25, 3.5–12 cm long; involucre of 3–5 linear, subulate or caudate bractlets to 15 mm long; pedicels 6–26 mm long; petals white (2) 4–8.5 mm long at least some deeply bilobed; filaments white, the anthers whitish to dark green or yellow with pollen; styles ca 1 mm long, the stigmas incurved; fruit 8–12 mm long, obovate to orbiculate, strongly flattened, the lateral ribs with wings 1–1.5 mm wide, the dorsal ribs filiform. Aspen, tall forb, fir, oak-maple, willow, streamside, and wet meadow communities at 1430 to 2930 m in Box Elder, Cache, Carbon, Davis, Duchesne, Juab, Salt Lake, Sanpete, Sevier, Summit, Tooele, Uintah, Utah, Wasatch, and Weber counties; Eurasia and across much of North America; 61 (iii).

Hydrocotyle L.

Perennial herbs; stems creeping or floating, rooting at the nodes; leaves petiolate, often peltate; inflorescences sessile, or borne on axillary peduncles; involucre small or lacking; petals white, greenish, or yellow; calyx minute or lacking; stylopodium conic to depressed; fruit orbicular to ellipsoid, more or less flattened laterally, the dorsal surfaces rounded or acute, the ribs obsolete or narrow and acute; carpophore lacking.

Hydrocotyle verticillata Thunb. Plants glabrous, with slender creeping stems; leaves peltate, suborbicular, 0.5–6 cm wide, shallowly lobed and often crenate; petioles slender, 3–20 cm long or longer; peduncles slender, axillary; flowers apparently verticillate in few to several well separated whorls; petals pale, small; fruits subsessile, subtruncate at the base, 1.5–2 mm long, 2–3 mm

wide. Moist ground or in water at 850 to 1005 m in Washington County; South America north to Massachusetts and California; 4 (0).

Ligusticum L.

Perennial caulescent or acaulescent herbs from taproots; leaves ternately or ternate-pinnately compound or dissected, the lower ones with well-developed petioles, the upper ones with blades arising directly from dilated sheaths; umbels compound; involucre and involucel lacking or of a few narrow bracts or bractlets; calyx teeth evident or obscure; petals white; stamens white; stylopodium low-conic; carpophore divided to the base; fruit oblong to ovate or suborbicular, subterete or slightly compressed laterally, the ribs evident, often winged.

1. Ultimate leaf segments more or less linear or narrowly elliptic, mostly 0.5–3 mm wide, entire 2
- Ultimate leaf segments (at least some) elliptic or broader, some usually over 3 mm wide, sometimes toothed or lobed 3
- 2(1). Umbels mostly solitary, occasionally 2, rarely 3, never opposite; rays 0.5–3.6 cm long; petioles 1.2–13.5 cm long; leaf blades 3–19 cm long; plants 10–45 (64) cm tall, of the Uinta Mts. *L. tenuifolium*
- Umbels 2–5 or more the lateral ones occasionally opposite or whorled; rays 2.5–6.5 (8) cm long; petioles 8–32 cm long; leaf blades (9) 12–30 cm long; plants (4) 6–10 dm tall, of central Utah and western Uinta Mts. *L. filicinum*
- 3(1). Umbels 2 or 3, the lateral 1 or 2 alternate, subtended by much reduced leaves; plants of the Raft River Mts. *L. grayi*
- Terminal umbel subtended by often opposite or whorled umbels and 1–3 or more alternate umbels from the axils of reduced or well-developed leaves; plants widespread *L. porteri*

Ligusticum filicinum Wats. Fernleaf Ligusticum. Plants (4.5) 6–13 dm tall, aromatic, glabrous, from a heavy taproot with a simple or branched crown, the crown clothed with fibrous persisting petiole bases; leaves basal and 1–3 cauline, ternate-pinnately 3 times dissected, with 5–6 (7) opposite pair of lateral primary leaflets; basal petioles 8–32 cm long; blades (9) 12–30 cm long, ovate in outline, the lowest pair of primary leaflets 1/2–3/4 as long as the leaf blade, on petiolules 2.5–10 cm long; ultimate leaf segments 1–18 mm long, 0.7–2.5 (3) mm wide, linear, narrowly elliptic or narrowly deltoid, entire, bifid, or trifid; peduncles (5) 10–17 (23) cm long; terminal umbel subtended by 1–3 smaller umbels, the lateral ones arising from axils of leaves and alternate or the upper ones not from leaf-axils and opposite or in whorls of 3; involucre lacking; rays 7–27, 2.5–6.5 (8) cm long; involucels of 1–3 linear separate usually deciduous bractlets to 5 mm long; pedicels 4–12 mm long; petals white; stamens whitish; styles ca 0.5 mm long; fruit 5–8 mm long. Tall forb, aspen, sagebrush-grass, forb-grass, Douglas fir, and spruce-fir communities at 1920 to 3110 m in Cache, Duchesne, Juab, Morgan, Sanpete, Summit (type from the Uinta Mts.), Tooele, Utah and Wasatch counties; Idaho, Montana, Utah and Wyoming; 46 (xx). This taxon is rather easily confused with *L. porteri* (q.v.).

Ligusticum grayi Coult. & Rose Grays Ligusticum. Plants 3–6 (9.5) dm tall, glabrous, aromatic, from a stout taproot with simple or branched crown, the crown

clothed with fibrous persistent petiole bases; leaves basal and usually 1–3 much reduced cauline ones, ternate-pinnately twice compound and then pinnatifid with (2) 3–5 opposite pairs of lateral primary leaflets; petioles (2.5) 4–34 cm long; blades 4–26 cm long, ovate in outline, the lowest pair of primary leaflets 1/2–3/4 as long as the blade, on petiolules 1–6.5 cm long, the larger secondary leaflets pinnatifid with the larger lobes again bi- or trilobate; peduncles 2–55 (90) cm long; terminal umbel subtended by 1–2 alternate umbels arising from the axils of much reduced leaves; involucre lacking or rarely of 1 linear mostly deciduous bract to ca 1 cm long; rays 8–18, 1.2–4 cm long; involucels lacking or of 1–5 linear bractlets to 4.5 mm long; pedicels 4–10 mm long; petals white; stamens whitish; styles 0.8–1.1 mm long; fruit 4–6 mm long. Forb-grass and fir communities and snowflush areas at 2650 to 2900 m in the Raft River Mts., Box Elder County; Washington to California and east to Idaho; 3 (iii).

Ligusticum porteri Coult. & Rose Southern Ligusticum. [*L. brevilobum* Rydb., type from the Aquarius Plateau]. Similar to *L. filicinum*, but leaves with broader ultimate segments, these (1.5) 3–8 mm wide, and with the terminal umbel often subtended by a whorl of 3–8 lateral umbels, and occasionally with up to 12 or more umbels, but sometimes with the lateral umbels only 2 and opposite, but not alternate; n = 11. Sagebrush, oak, aspen, Douglas fir, spruce, fir, and occasionally in open forb-grass communities at 2255 to 3171 m in Beaver, Carbon, Duchesne, Garfield, Grand, Iron, Juab, Kane, Millard, Piute, San Juan, Sanpete, Sevier, Uintah, and Utah counties; southern Wyoming to northern Mexico, west to Idaho and Arizona; 58 (x). Plants of this taxon are sometimes mistaken for *Conioselinum scopulorum* (q.v.). The separation of *L. porteri* from *L. filicinum* is made difficult by a rather extensive overlap in distribution and lack of definitive morphology in plants from Utah County south to Sevier County. Otherwise the ranges of the two taxa are essentially discrete in Utah, but occasional specimens from scattered locations throughout the state would be difficult to place without location data.

Ligusticum tenuifolium Wats. Small Ligusticum; Slender-leaf Ligusticum. [*L. filicinum* var. *tenuifolium* (Wats.) Math. & Const.]. Plants 11–64 cm tall, glabrous mildly aromatic from a taproot, the crown more or less covered by short shredded marcescent bases; leaves basal and sometimes 1 or 2 cauline, ternate and then 2–3 times pinnate with 5–7 pairs of lateral primary leaflets; petioles 1.2–13.5 cm long; blades 3–19 cm long, completely dissected, ovate in outline; lowest pair of primary leaflets 1/2–2/3 as long as the blade, on petiolules (0.5) 1–4 cm long, the upper primary leaflets progressively reduced, the ultimate segments 2–9 mm long, 0.5–1.5 (2.5) mm wide; scapes or peduncles 10–45 (61) cm long; involucre lacking; umbel solitary or the terminal one sometimes subtended by 1 or 2 lateral ones that usually arise from the axil of a reduced leaf; rays 6–15, 0.5–3.6 cm long; involucels lacking or of 1–3 filiform-linear bractlets to 3 mm long; pedicels 2–4 mm long; calyx obsolete; petals ca 1 mm long, white, sometimes tinged with light purple in age; stylopodium evident, conic; styles 0.5–0.8 mm; fruit about 3–5 mm long. Moist and wet meadows, along streams in lodgepole pine and Engelmann spruce woods at 2440 to 3420 m, common across the Uinta Mts., in Daggett, Duchesne, Summit, Uintah, and Wasatch counties; Oregon to Montana and south to Colorado; 37 (xviii).

Through a series of features (none of which are exclusive), plants of *L. tenuifolium* are readily distinguished from those of *L. filicinum*. The two taxa are sympatric in the western Uinta Mts., where some intermediate specimens occur, but the range of overlap is small.

Lomatium Raf.

Plants perennial, acaulescent or caulescent, occasionally with a short pseudostem, glabrous or pubescent, from a slender taproot with sometimes 1 or more tuber-like segments, or from a thickened woody branching caudex, sometimes clothed at the base with marcescent leaf bases; stems simple or rarely branched, the peduncles and umbels mostly solitary; leaves pinnate or pinnately to ternate-pinnately compound, the sheaths often dilated; petioles developed, and distinct or confluent with and poorly differentiated from the sheath, or lacking and the petiolules arising directly from the sheath, the ultimate segments extremely variable; involucre lacking or inconspicuous; rays few to many, spreading to ascending, the central ones often shorter and sterile; involucre mostly of separate or partly united bractlets, rarely lacking; pedicels slender or stout, the central ones often shorter and sterile; petals small, yellow, white, greenish yellow or purplish; calyx teeth obsolete or small, or conspicuous in some species; styles slender, often curved or coiled; stylopodium lacking; carpophore divided to the base; fruit linear to orbicular or obovate, flattened dorsally, glabrous or pubescent, dorsal ribs filiform or obsolete or occasionally with rudimentary wings at the base. Note: The genus is closely related to *Cymopterus*, and the filiform wingless dorsal ribs of the fruit seem to be the only consistent difference from *Cymopterus*. The dependability of this separation is somewhat weakened by the tendency for lack of dorsal wings in some *Cymopterus* taxa.

- 1. Leaves once-pinnate and/or the ultimate segments over 15 mm long and fewer than 50 per leaf; plants glabrous and/or petals yellow when fresh 2
- Leaves more than once-compound, the ultimate segments not over 15 mm long and mostly more than 50 per leaf or, if a few ultimate segments over 15 mm long or fewer than 50 per leaf, the plants pubescent and petals white 9
- 2(1). Leaves once-pinnate or partly bipinnate, the leaflets sessile and more or less confluent with the rachis; plants from stout, more or less woody caudices, clothed at the base with marcescent leaf bases, from southern Utah 3
- Leaves more than once-compound, the primary leaflets mostly with well-developed petiolules, not confluent with the rachis; (plants from taproots or small caudices, not much if at all clothed at the base with marcescent leaf bases, from northern Utah 6
- 3(2). Leaflets lanceolate to elliptic, 2–12 mm wide, some always over 5 mm wide; plants of Grand and northern San Juan counties *L. latilobum*
- Leaflets linear, not over 4 mm wide; distribution not as above 4
- 4(3). Leaves with 1–7 elongate terete leaflets that simulate the rachis in diameter and shape, these 1–18 cm long, at least some commonly over 5 cm long in each leaf, calyx teeth greenish, acute, ca 1 mm long; plants of Emery, Garfield, Sevier, and Wayne counties *L. junceum*

- Leaves either with more than 7 leaflets and/or leaflets less than 5 cm long, more or less flattened and, wider than the rachis; calyx teeth not over 0.6 mm long, scarious or greenish; plants of various distribution . . . 5
- 5(4). Plants 2–12 (17) cm tall, of Garfield and Iron counties; fruit 4–7 mm long, leaflets 3–13 per leaf, 0.2–1.5 (2) cm long *L. minimum*
- Plants 15–30 cm tall or taller, not known from Garfield and Iron counties; fruit 5–15 mm long; leaflets sometimes more than 13 per leaf, sometimes over 2 cm long *L. kingii*
- 6(2). Ultimate leaflets less than 3 times as long as wide, at least some dentate; rays (4) 8–19 cm long; peduncle often swollen just beneath the umbel; plants of the Deep Creek Mts. and western Box Elder County *L. nudicaule*
- Ultimate leaflets 3 or more times longer than wide, entire; rays 0.5–10 cm long; peduncle not swollen just beneath the umbel; distribution not as above . . . 7
- 7(6). Plants caulescent, glabrous; peduncles to 13 cm long; involucre lacking *L. ambiguum*
- Plants acaulescent or, if caulescent, the peduncles mostly over 13 cm long and plants puberulent; involucre present, to 1 cm long 8
- 8(7). Plants strongly aromatic; caudex often clothed with marcescent leaf bases; leaves strictly basal; ultimate leaflets 0.3–5 (6.5) cm long, 0.5–2 (4) mm wide; lateral wings of the fruit to 1 mm wide *L. kingii*
- Plants not strongly aromatic; marcescent leaf bases lacking or weakly persisting; cauline leaves sometimes 1–3; ultimate leaflets 1–13 cm long, 1–6 (15) mm wide; lateral wings of the fruit 1–2 mm wide *L. triternatum*
- 9(1). Larger mature leaves with blades (10) 15–30 cm long, ternate-pinnately compound, the larger ultimate segments 2–3 mm wide; plants 3–13 dm tall; peduncles fistulose, (3) 4–6 (10) mm thick at the base *L. dissectum*
- Larger mature leaves with blades 2–11 cm long or, if longer, either not at all ternate or with ultimate segments not over 1 mm wide; plants rarely over 50 cm tall; peduncles fistulose or not, often less than 4 mm thick 10
- 10(9). Plants pubescent 11
- Plants glabrous or at most scabrous 15
- 11(10). Ovaries and fruit glabrous or somewhat scabrous; plants mainly of central and eastern Utah 12
- Ovaries and young fruit densely pubescent, the older fruit sometimes glabrous but often retaining some hairs; plants of various distribution 13
- 12(11). Bractlets of the involucre ca 10, the longer ones 4–10 mm long, pubescent; herbage more or less villous *L. macrocarpum*
- Bractlets of the involucre 1–5, 1–4.5 mm long, glabrous; herbage glabrate to puberulent *L. juniperinum*
- 13(11). Longer ultimate leaf segments 5–27 mm long, some often over 1 mm wide; petals white *L. nevadense*
- Longer ultimate leaf segments 1–5 mm long, to 1 mm wide; petals yellow, rarely white 14
- 14(13). Petals and anthers yellow; leaves often conspicuously ternate-pinnately compound; plants common *L. foeniculaceum*
- Petals white; anthers purple or whitish; leaves pinnately or scarcely ternate-pinnately compound; plants apparently rare, known only from western Millard County *L. ravenii*

- 15(10). Lowest pair of primary leaflets less than 1/3 as long as the leaf blade 16
- Lowest pair of primary leaflets 1/3–3/4 as long as the leaf blade 18
- 16(15). Mature pedicels 1–10 mm long; fruit 4–9 mm long, leaves and peduncles scabrous, the blades 2–7 cm long; plants of the Great Basin and Washington County *L. scabrum*
- Mature pedicels (at least the longer) 10–20 mm long; fruit (6) 8–20 mm long; leaves and peduncles glabrous or plants of the Colorado Basin 17
- 17(16). Leaf blades 3–7 cm long, the ultimate segments 2–4 mm long; fruit 8–10 mm long; rays 4–6, 1–3 cm long; plants densely scabrous, 10–15 cm tall, of western Colorado, to be expected in Utah in extreme eastern Grand and San Juan counties *L. eastwoodiae* (Coul. & Rose) Macbr.
- Leaf blades 7–24 cm long, the ultimate segments 1–15 mm long; fruit to 20 mm long; plants glabrous, glaucous, 8–40 cm tall, of the Colorado Basin and Washington County *L. parryi*
- 18(15). Bractlets of the involucre broadly elliptic to obovate, to 3 mm wide; pedicels 1–2 mm long; ultimate segments of leaves 2–13 mm long, 0.5–4 mm wide, dimorphic; plants of northwestern Box Elder County *L. cous*
- Bractlets of the involucre linear to subulate, not over 1 mm wide; pedicels 2–18 mm long; ultimate segments of leaves 1–7 mm long, 0.2–1.5 mm wide, not much if at all dimorphic 19
- 19(18). Petals white or cream; ultimate segments of leaves 0.5–1.5 mm wide; plants not aromatic; pedicels 3–16 mm long; leaves with 3–6 opposite pairs of lateral primary leaflets; rare glabrous forms ... *L. juniperinum*
- Petals yellow when fresh; ultimate segments of leaves 0.2–0.6 mm wide; plants strongly aromatic, glabrous; pedicels various; leaves various 20
- 20(19). Fruit 2–4 mm wide, the wings 0.4–0.6 mm wide; pedicels 2–5 mm long; rays very unequal ... *L. bicolor*
- Fruit 5–8 mm wide, the wings ca 1.5–2 mm wide; pedicels 5–18 mm long; rays subequal *L. grayi*

Lomatium ambiguum (Nutt.) Coult. & Rose Wyeth Biscuitroot. [*Eulophus ambiguus* Nutt.]. Plants caulescent, 1–4 dm tall, glabrous, lacking persistent leaf bases; root very slender, or sometimes with 1 or more globose or elongate tuberous segments; leaves ternately or ternate-pinnately compound; petioles to 2 cm long or lacking and blades arising from a dilated sheath 1.5–4 cm long; blades 4–15 cm long, ovate in outline, the lowest pair of primary leaflets mostly over 1/2 as long as the blade, with petiolules 1–4 cm long, the ultimate segments 15–45, 0.3–9 cm long, 1–4 mm wide, often very unequal in the same leaf; peduncle 2.5–13 cm long; involucre lacking; rays 0.5–6.5 cm long, very unequal in the same umbel; involucre lacking; pedicels 2–12 mm long; petals and stamens yellow, fading in age; styles ca 1 mm long; fruit 8–10 mm long, 2–3 mm wide, the lateral wings ca 0.5 mm wide, the dorsal ribs filiform; n = 11. Sagebrush and mountain brush communities at 1525 to 1980 m in Cache, Salt Lake, Utah, and Weber counties; Washington and British Columbia to Montana, south to Wyoming; 14 (0). The larger leaf segments are conspicuously different from the very narrow and shorter ones of *L. bicolor*.

Lomatium bicolor (Wats.) Coult. & Rose Wasatch Biscuitroot. [*Peucedanum bicolor* Wats., type from Parleys

Park, Summit County]. Plants 10–50 cm tall, acaulescent or caulescent, aromatic, glabrous, lacking persistent leaf-bases or these few and weakly persisting; from a slender taproot, this often with one or more tuberous branches; leaves ternate-pinnately decomposed; petioles mostly lacking and the blades arising directly from a dilated sheath; blades 4–12 cm long, ovate in outline, finely and completely dissected, the lowest pair of primary leaflets mostly over 1/2 as long as the leaf blade, with petiolules 2.5–6 cm long, each with 5–6 opposite or offset pairs of secondary leaflets, the ultimate segments mostly more than 300, 1–4 (6) mm long, 0.2–0.6 mm wide; peduncle 10–28 cm long; rays 3–12 (20), 1–8 (11) cm long, very unequal in the same umbel; involucre lacking or of 1–8 linear distinct bractlets; pedicels 2–5 mm long; petals and stamens yellow; styles ca 1 mm long; fruit 8–11 mm long, 2–4 mm wide, congested; lateral wings 0.4–0.6 mm wide, dorsal ribs filiform; n = 11. Sagebrush, mountain brush, aspen, and meadow communities at 1525 to 2438 m in Cache, Morgan, Rich, Salt Lake, and Weber counties; Idaho; 25 (0). This taxon has been included in *L. leptocarpum* (T. & G.) Coult. & Rose. Perhaps they should be combined but, if so, *L. bicolor* is the proper name.

Lomatium cous (Wats.) Coult. & Rose Cous Biscuitroot. [*Peucedanum cous* Wats.]. Plants 5–15 (25) cm tall, not or weakly aromatic, glabrous, from a globose or fusiform tuberous root, this sometimes deep seated and giving rise to a subterranean pseudostem; leaves basal and sometimes 1 or 2 cauline on the lower 1/3–1/2 of the stem, 2–3 times pinnately or ternate-pinnately compound; blades 4–8 (11) cm long, mostly borne on dilated sheaths with the petioles obsolete or short, or some leaves arising from the roots and then with etiolated petioles to 11 cm long, the lowest pair of primary leaflets 1/2–3/4 as long as the leaf blade, sessile or with petiolules to 42 mm long, ultimate segments or lobes 2–13 mm long, 0.5–4 mm wide, as many as 200 or more, linear to elliptic; peduncles 1–7, 3–18 cm long; involucre lacking or of a solitary bract to 7 (10) mm long; rays 6–15, 0.4–5 cm long, strongly dimorphic in the same umbel; bractlets of the involucre 6–10, 3–5 mm long, to 3 mm wide, broadly elliptic, ovate or obovate, greenish, sometimes with yellowish or scarious margins; pedicels 1–2 mm long; calyx teeth obsolete; petals and stamens yellow when fresh, fading to white in age; styles ca 1.5 mm long; fruit 6–9 mm long, the lateral wings to ca 1 mm wide, the dorsal ribs filiform or obscurely winged. Sagebrush-grass communities at 2440 to 2560 m, in the Grouse Creek and Raft River mts., Box Elder County; Oregon to Montana, south to Nevada; 2 (ii).

Lomatium dissectum (Nutt.) Math. & Const. Giant Lomatium. [*Leptotaenia dissecta* Nutt.]. Plants 3–13 dm tall, mostly short caulescent, puberulent or rarely glabrous, from a woody thickened taproot or caudex, without marcescent leaf bases or these soon shredding and deciduous; leaves pinnately or ternate-pinnately decomposed, with 5–9 opposite or offset pairs of primary leaflets, or the upper cauline leaves much reduced; petioles 3–20 cm long, often lacking on cauline leaves and then the blades sessile on a dilated sheath; blades 10–30 cm long or smaller on cauline leaves, ovate in outline, the lowest pair of primary leaflets usually over 1/2 as long as the leaf blade, with petiolules 2.5–12 cm long, ultimate segments numerous, 1–12 mm long, 0.5–3 mm wide;

peduncles 15–50 (90) cm long; involucre lacking or rarely of 1–3 deciduous bracts; rays 9–27, 2–7 (12) cm long; bractlets of the involucre 3–6 mm long, or occasionally much longer and foliaceous; pedicels 3–10 (15) mm long; petals and stamens yellow, yellow-green, or purplish; styles ca 1.5 mm long; fruit 9–15 (20) mm long, 6–10 mm wide, the lateral wings ca 1–2 mm wide, the dorsal ribs filiform. Sagebrush, pinyon-juniper, oak-maple, aspen-fir, riparian, and rarely greasewood-desert shrub communities at 1280 to 2650 (3170) m in Beaver, Box Elder, Cache, Duchesne, Iron, Juab, Millard, Morgan, Rich, Salt Lake, Sanpete, Summit, Tooele, Uintah, Utah, Washington, and Weber counties; British Columbia and Alberta south to California, Arizona and Colorado; 91 (xiii). Utah materials are referable to *var. eatonii* (Coul. & Rose) Cronq. [*Leptotaenia eatonii* Coul. & Rose; type from Utah]. Sometimes the leaves are mistaken for those of *Ligusticum porteri*, but the mostly solitary umbel is strikingly different from the usually opposite or whorled lateral umbels in addition to the terminal one in the *Ligusticum*.

Lomatium foeniculaceum (Nutt.) Coul. & Rose Desert-parsley. [*Ferula foeniculacea* Nutt.]. Plants 5–25 (38) cm tall, acaulescent, densely pubescent throughout, from a more or less branched caudex and deep taproot, often clothed at the base with persistent leaf-bases; leaves ternate-pinnately dissected, with 6–8 opposite pairs of lateral primary leaflets; petioles to 2.5 cm long or lacking and the blade arising from a dilated sheath; blades 2–13 cm long, completely and finely dissected, ovate in outline, the lowest pair of primary leaflets over 1/2 as long as the blade, sessile or with petiolules to 5 cm long, the ultimate segments numerous, often over 500, 1–3 (5) mm long, 0.5–1 (2.5) mm wide; peduncles 4–30 cm long; rays 5–20, 0.2–7 cm long; bractlets of the involucre 2–5 (6) mm long, separate or united at the base, linear; pedicels 2–12 mm long; petals and anthers yellow (rarely white) when fresh and mostly remaining yellow or occasionally turning purplish; styles 1.5–2 mm long; fruit 5–10 mm long, 3–7 mm wide, lateral wings 1–2 mm wide, dorsal ribs filiform. Sagebrush (mostly black sagebrush), pinyon-juniper, and mountain brush communities at 1250 to 2635 m in Beaver, Box Elder, Daggett, Emery, Juab, Kane, Millard, Sanpete, and Tooele counties; Manitoba to Missouri and Texas, west to Oregon and California; 71 (xvi). Utah materials are generally referable to *var. macdougali* (Coul. & Rose) Cronq. [*L. macdougali* Coul. & Rose; *L. jonesii* Coul. & Rose, type from Ireland Ranch, Sevier County]. However, some plants from western Utah have ciliate petals and are referable to *var. fimbriatum* (Theob.) J. Boivin [*L. foeniculaceum* ssp. *fimbriatum* Theobald], but the diagnostic feature is not always reliable.

Lomatium grayi (Coul. & Rose) Coul. & Rose Milfoil Lomatium. [*Cogswellia grayi* Coul. & Rose; *Peucedanum millefolium* Wats, type from Antelope Island; *L. millefolium* (Wats.) Macbr.]. Plants (8) 15–40 (80) cm tall, acaulescent or subacaulescent, strongly aromatic, glabrous, from a simple or branched caudex and thick taproot often clothed at the base with marcescent, mostly shredded, fibrous leaf bases; leaves ternate-pinnately dissected, with 7–10 opposite pairs of lateral primary leaflets; petioles to 14 cm long or lacking and the blades arising from a dilated sheath 1–16 cm long; blades 7–16 (2) cm long, finely and completely dissected, ovate in

outline, the lowest pair of primary leaflets from 1/2 to as long as the blade, with petiolules 1–7.5 cm long, the ultimate segments very numerous, extremely minute, 1–3 (6) mm long, 0.2–0.3 mm wide; peduncle 10–45 (70) cm tall; rays 10–26, 1.5–6 (8) cm long; bractlets of the involucre 3–5 mm long, linear, separate or united at the base; pedicels 5–13 (18) mm long; petals and stamens yellow when fresh, soon fading whitish when dried; styles 1.5–2.5 mm long; fruit 6–12 mm long, 5–8 mm wide, the lateral wings ca 2 mm wide, the dorsal ribs filiform; $n = 11$. With 2 intergrading but more or less geographically correlated varieties.

1. Fruit 6–9 (10) mm long, the lateral wings to ca 1.5 mm wide; leaves rather openly dissected, with a few hundred ultimate segments; plants 8–20 (35) cm tall, of the western tier of counties from Box Elder south to Beaver County *L. grayii* var. *depauperatum*
- Fruit 8–12 mm long, the lateral wings to ca 2 mm wide; leaves with congested and numerous ultimate segments, these several hundred to a thousand or more; plants 15–40 (80) cm tall, of more easterly distribution and only in the eastern 1/4 of the western tier of counties where more or less transitional with the preceding variety *L. grayii* var. *grayi*

Var. depauperatum (Jones) Mathias [*Cogswellia millefolia* var. *depauperata* Jones, type from Dugway, Tooele County]. Desert shrub, pinyon-juniper, and mountain brush communities at 1525 to 2835 m in Beaver, Box Elder, Juab, Millard, and Tooele counties; western Utah and adjacent Nevada; 58 (xiii).

Var. grayi Sagebrush, pinyon-juniper, mountain brush, ponderosa pine, and Douglas fir communities at 1340 to 2745 m in Box Elder, Cache, Daggett, Davis, Duchesne, Grand, Juab, Morgan, Rich, Salt Lake, San Juan, Sanpete, Summit, Tooele, Uintah, Utah, and Weber counties; Washington to Nevada and east to Idaho and Colorado; 121 (xxiii).

Lomatium junceum Barneby & N. Holmgren Rush-lomatium. Plants (6) 10–37 cm tall, acaulescent, glabrous, from a simple to much branched woody caudex, clothed at the base with persistent petioles; leaves rushlike, trifid or pinnatifid or rarely reduced to a petiole and a linear bladeless rachis, with 1–7 linear segments; petioles 3–15 mm long with a short sheath at the base; blades 3–17 cm long, the segments 1–18 cm long, 1–2 mm wide, terete and similar to the rachis and petioles in diameter; peduncles 5–25 cm long; rays of umbels 6–13, 1.5–3 cm long; bractlets of the involucre 1.5–3 mm long, distinct or connate at the base, linear; pedicels 4–11 mm long; calyx teeth to ca 1 mm long, acutish, somewhat persistent; petals and stamens bright yellow or cream, quickly fading to white when frozen or dried; styles 2–3 mm long; fruit 8–12 mm long, 5–7 mm wide, the lateral wings 1–2 mm wide, the dorsal ribs filiform. Desert shrub, sagebrush, pinyon-juniper, ponderosa pine, and Douglas fir communities at 1615 to 2485 m in Emery (type from San Rafael Swell), Garfield, Sevier, and Wayne counties; endemic; 21 (iii).

Lomatium juniperinum (Jones) Coul. & Rose Juniper Lomatium. [*Peucedanum juniperinum* Jones, type from Coalville]. Plants 8–32 cm tall, acaulescent or with 1–3 leaves on the lower part of the stems, more or less hirtellous to glabrate and glabrous, often with a short pseudoscape, from a taproot with simple or sparingly branched crown, lacking marcescent leaf bases or these

weakly persistent; leaves ternate-pinnately dissected, with (3) 4–6 opposite or offset pairs of lateral primary leaflets; petioles to 8 cm long or lacking and the blades arising directly from dilated sheaths 1–4 cm long; blades 2.5–8 (11) cm long, ovate in outline, the lowest pair of lateral primary leaflets 1/3 as long to as long as the leaf blade, with petiolules to 3 cm long, the ultimate segments 50–400, 1–7 mm long, 0.7–1.5 mm wide; peduncles 6–29 cm long; rays of the umbel 3–12, 1–8 cm long; bractlets of the involucrel 1–5, 1–4.5 mm long, linear, distinct or connate at the base; pedicels 3–16 mm long; petals white, cream, or yellow; anthers white, ochroleucus, purple, or yellow; styles 1–2 mm long; fruit 5–8 (11) mm long, 3–6 mm wide, glabrous, or scabrous to sparsely hirtellous, especially when young; lateral wings 0.5–1.5 mm wide, the dorsal ribs filiform. Sagebrush, pinyon-juniper, forb-grass, aspen, Douglas fir, and alpine communities at 1830 to 3230 m in Carbon, Daggett, Duchesne, Grand, Juab, Sanpete, Summit, Uintah, Utah, and Wasatch counties; Wyoming, Idaho, and Colorado; 52 (xx). This species is variable as to color of petals and anthers. Plants with yellow petals and anthers are known only from the west and north side of the Uinta Mts. and West Tavaputs Plateau. In one population from the east end of the Uinta Mts., the flower color is white, cream, and yellow. Those with white petals and white to purplish anthers are found in the Wasatch Mts., south slope of the Uinta Mts., Tavaputs Plateau and north end of the Wasatch Plateau. The plants are sometimes confused with *L. nevadense* and *Cymopterus lemmonii*.

Lomatium kingii (Wats.) Cronq. Stinking Lomatium. Plants 1.5–5 dm tall, acaulescent, glabrous, strongly aromatic, from a branched caudex, this clothed with persistent leaf-bases; leaves pinnatifid to bipinnate or ternate-pinnately compound; petioles gradually expanded into a dilated sheath, with the sheath 2–21 cm long; blades 2–15 cm long, usually oblong in outline, ultimate leaflets or segments about 7–30, 0.3–6.5 cm long, 0.5–2 (4) mm wide; peduncles 12–47 cm long; rays of the umbel (3) 5–12, 1–5 cm long; bractlets of the involucrel 3–10 mm long; pedicels 2–10 mm long; calyx teeth ca 0.5 mm long, rather scarious; petals and stamens yellow, soon turning pale to white in age; styles 2–3 mm long; fruit 5–15 mm long, 3–5 mm wide, the lateral wings 0.5–1 mm wide, the dorsal ribs filiform or somewhat prominent with rudimentary wings. There are two geographically correlated varieties that are somewhat transitional morphologically.

1. Fruit 5–8 mm long, the lateral wings ca 0.5 mm wide; umbels with only 3–6 rays; leaves once pinnatifid with sessile segments or some of the lower pairs of segments bipinnatifid; plants of Washington and western Millard counties *L. kingii* var. *alpinum*
- Fruit 10–15 mm long, the lateral wings ca 1 mm wide; umbels with up to 12 rays; leaves pinnatifid to ternate-pinnately compound, with the lowest pair of primary leaflets on petiolules (l) 2.5–9 cm long; plants of Sevier and eastern Millard counties and northward *L. kingii* var. *kingii*

Var. *alpinum* (Wats.) Cronq. [*Peucedanum graveolens* var. *alpinum* Wats.; *P. graveolens* Wats., type from the Wasatch Mts.]. Pinyon-juniper and mountain brush communities at 2225 to 2440 m in Millard and Washington counties; western Nevada and southwestern Utah; 4 (0).

Var. *kingii* [*Peucedanum kingii* Wats., type from the Wasatch and Uinta mts.; *L. nuttallii*, misapplied, not

(Gray) Macbr.]. Sagebrush, bullgrass, mountain brush, Douglas fir, limber pine, and spruce-fir communities, often in rocky places, mostly on limestone and other basic substrates, sometimes in raw snowflush areas, at 1980 to 3200 m in Cache, Davis, Duchesne, Millard, Rich, Salt Lake, Sanpete, Sevier, Summit, Tooele, Utah, Wasatch, and Weber counties; western Nevada, and western Wyoming; 85 (xviii).

Lomatium latilobum (Rydb.) Mathias Canyonlands Lomatium. [*Cynomarathrum latilobum* Rydb., type from Wilson Mesa, Grand County]. Plants (6) 10–30 cm tall, acaulescent, glabrous, from a branched woody caudex, clothed with persistent leaf-bases; leaves pinnate with 3–4 (5) pair of lateral leaflets; petioles 2–16 cm long; blades 1–10 cm long, oblong in outline; leaflets 1–4 cm long, 2–12 mm wide, sessile, entire or a few bifid or trifid; peduncles 4–27 cm long; rays of the umbel 4–13, 0.5–2 cm long; bractlets of the involucrel 2–15 mm long, 0.5–2 mm wide, linear or elliptic, separate; pedicels 1–4 mm long; calyx teeth 1–1.5 mm long, acute; petals yellow when fresh, drying white; styles 2–3 mm long; fruit 8–12 mm long, 3–7 mm wide, the lateral wings ca 1 mm wide, the dorsal ribs filiform. Pinyon-juniper and desert shrub communities, mainly in Entrada Sandstone, at ca 1525 m in Grand and San Juan counties; Mesa County, Colorado; a Navajo Basin endemic; 17 (i).

Lomatium macrocarpum (H. & A.) Coult. & Rose Big-seed Lomatium. [*Ferula macrocarpa* H. & A.]. Plants 12–30 cm tall, acaulescent or subcaulescent with leaves mostly on the lower 1/4 of the stem, more or less tomentose-villous or glabrate, from a thickened taproot with a simple or sparingly branched crown with few or no persistent leaf bases; leaves pinnately or ternate-pinnately dissected, with ca 4 opposite pair of lateral primary leaflets; petioles often long tapering into a dilated sheath, the petiole and sheath 3–6 cm long; blades 3–6 cm long, ovate in outline, the lowest pair of primary leaflets 1/2–3/4 as long as the leaf blade, sessile or with petiolules to 1 cm long, ultimate segments 30–300 or more, 1.5–6 mm long, 0.5–2 mm wide, elliptic or linear; peduncles 8–26 cm long; rays of the umbel 6–18, 1–4 (6.5) cm long; bractlets of the involucrel ca 10, 2–10 mm long, separate or united at the base, pubescent; pedicels 2–5 mm long; calyx teeth to ca 0.5 mm long; petals white or purplish in age; anthers white; styles ca 2–3 mm long; fruit 9–12 (15) mm long, 4–5 mm wide, glabrous, the lateral wings 1–1.5 mm wide, the dorsal ribs filiform; 2n = 22. Desert shrub, sagebrush, and pinyon-juniper communities at 1480 to 2550 m in Daggett, Juab, Millard, Sanpete, Tooele, and Uintah counties; southern British Columbia to California and east to Manitoba and Colorado; 29 (xi).

Lomatium minimum (Mathias) Mathias Least Lomatium. [*Cogswellia minima* Mathias, type from Bryce Canyon]. Plants 2–12 (17) cm tall, acaulescent, glabrous or scabrous, from a branched caudex, the caudex branches clothed with persistent leaf bases; leaves once-pinnatifid or rarely trifid, with (3) 5–9 (13) segments; petioles to 2 cm long; blades 1–2.5 cm long, the segments 2–15 (20) mm long, 0.5–2 mm wide; peduncles to 10 (16) cm long; rays of the umbel 3–6, 0.3–2.3 (3.2) cm long; bractlets of the involucrel 2–4 mm long, linear-subulate, separate; pedicels 1–3 mm long; calyx teeth to 0.6 mm long, acute, greenish or purplish in age with scarious margins; petals and stamens yellow, drying to cream; styles 1.5–2 mm long; fruit 4–7 mm long, 3–4 mm wide,

the lateral wings 0.5–1 mm wide, the dorsal ribs mostly filiform. Forb-grass, ponderosa pine, and bristlecone pine communities, often on exposed ridges and raw escarpments, often on limestone at 2165 to 3170 m in Garfield, Iron, and Kane counties; endemic; 20 (0). This appears much like a diminutive form of *L. kingii*.

Lomatium nevadense (Wats.) Coult. & Rose Nevada Lomatium. [*Peucedanum nevadense* Wats.]. Plants 10–36 cm tall, acaulescent or with 1 or 2 leaves on the lower part of stems, more or less pubescent throughout, from a slender root frequently with a fusiform tuberous segment, with or without persistent leaf bases; leaves 2–3 times pinnately compound, with ca 4 opposite pair of lateral primary leaflets; petioles to 7.5 cm long or often lacking and the blade sessile on a dilated sheath; blades 2.5–9 cm long, ovate in outline, the lowest pair of primary leaflets ca 1/2 to nearly as long as the blade, sessile or on petiolules to 5 mm long, the ultimate segments 20–80, 1–27 mm long, 0.5–3 mm wide; peduncles 7–33 cm long; rays of the umbel 7–12, sometimes with as few as 3 of them fertile, 1.5–4 cm long; bractlets of the involucrel 2–3 mm long, lanceolate, linear-elliptic, or narrowly obovate; pedicels 4–11 mm long; petals and stamens white; styles ca 1–1.5 mm long; fruit 5–10 mm long, 3–7 mm wide, densely puberulent or glabrate to glabrous; lateral wings 0.8–2 mm wide, the dorsal ribs filiform. Desert shrub, sagebrush, pinyon-juniper, mountain brush, and ponderosa pine communities at 1524 to 2285 m in Beaver, Garfield, Iron, Kane, Millard, and Washington counties; Oregon and California east to Colorado and Arizona; 44 (viii). Our materials are perhaps referable to var. *parishii* (Coult. & Rose) Jepson [*Peucedanum parishii* Coult. & Rose]. This variety has been keyed as having glabrous fruits, and the Utah materials with pubescent fruits have been referred to as var. *nevadense*. However, the Utah plants have dimorphic ultimate leaf segments 1–27 mm long. This is a feature of var. *parishii*. The ultimate leaf segments of var. *nevadense* are only 2–3 mm long. A specimen from Navajo Mt. (Albee 4463 UT), San Juan County, has uniformly small leaf segments and glabrous fruits.

Lomatium nudicaule (Pursh) Coult. & Rose Naked-stem Lomatium. [*Smyrniacum nudicaule* Pursh]. Plants 2–4.5 dm tall, acaulescent, glabrous, from a taproot, without persistent leaf bases or these few and weakly persisting; leaves ternate or biternate, with 3–11 distinct leaflets; petioles to 6 cm long or obsolete and the blades arising from a dilated sheath; blades 4–10 cm long, ovate in outline, the leaflets 2–5 cm long mostly 1–5.5 cm wide, ovate or orbicular to reniform, coarsely toothed toward the apex; peduncles 15–27 cm tall, sometimes swollen at the apex; rays of the umbel 7–27, 8–10 cm long; involucrel lacking; pedicels 3–10 mm long; petals yellow; styles ca 1–2 mm long; fruit 8–12 mm long, 2–5 mm wide, the lateral wings ca 0.5 mm wide, the dorsal ribs filiform; $n = 11$. Sagebrush, pinyon-juniper, and mountain brush communities at 1585 to 2530 m in Box Elder, Juab, and Tooele counties; British Columbia to California and east to Alberta and Idaho; 6 (iii).

Lomatium parryi (Wats.) Macbr. Parry Lomatium. [*Peucedanum parryi* Wats., type from southern Utah; *Cogswellia cottami* Jones, type from Beaverdam Mts.]. Plants 8–40 cm tall, acaulescent, glabrous, from a branched caudex, clothed at the base with persistent leaf bases; leaves bi- or partly tripinnatifid, with mostly 7–9

opposite pair of primary leaflets or the upper leaflets simple; petioles 3–16 cm long, terete, often persisting for some years without shredding; blades 7–24 cm long, the lowest pair of lateral primary leaflets less than 1/4 as long as the leaf blade, sessile or with petiolules to 1.2 cm long, the ultimate segments mostly 50–150, 1–15 mm long, 1–2 mm wide, acute; peduncles 5–32 cm long; rays of the umbel 8–13, 1–5 cm long; bractlets of the involucrel 3–10 mm long, entire, tridentate or rarely pinnatifid, spreading to reflexed in age; pedicels 1–2 cm long; petals yellow, turning white in age; styles 2–4 mm long; fruit 6–20 mm long, 5–10 mm wide, the lateral wings 1–3 mm wide, the dorsal ribs filiform. Desert shrub, blackbrush, pinyon-juniper, and mountain brush communities at 975 to 2320 m in Emery, Garfield, Grand, Iron, Kane, San Juan, and Washington counties; Utah to eastern California; 65 (v).

Lomatium ravenii Math. & Const. Raven Lomatium. Plants 4–23 cm tall, acaulescent, densely hirtellous throughout, from a taproot, with a simple or branched crown, usually clothed at the base by shredded leaf-bases; leaves ternate-bipinnate or 2–3 times pinnately dissected, with 5–7 (8) opposite pair of primary leaflets; petioles to 6 cm long or lacking and blades arising from dilated sheaths to 2 cm long; blades 1.5–8 cm long, finely and completely dissected, the lowest pair of primary leaflets usually over 1/2 as long as the leaf blade, sessile or with petiolules to 1.5 cm long, the ultimate segments 300–600 or more, 1–5 mm long, 0.5–1 mm wide; peduncles 2.5–21 cm long; rays of the umbel nearly obsolete or to 3.7 cm long; bractlets of the involucrel 1–3 mm long, linear, pubescent; pedicels 1–8 mm long; petals white; anthers purple; styles 1–2 mm long; fruit 6–10 mm long, 3–6 mm wide, pubescent, the lateral ribs with wings 0.5–1 mm long, the dorsal ribs filiform. Pinyon-juniper-mahogany communities, at ca 3440 m in western Millard County; Oregon and Idaho to California and Nevada; 1 (i). Except for the white petals, purple anthers and sometimes slightly less pubescent foliage, plants of this taxon could pass for plants of *L. foeniculaceum*. Fruiting specimens may be difficult to distinguish.

Lomatium scabrum (Coult. & Rose) Mathias Rough Lomatium; Cliff Lomatium. [*Cynomarathrum scabrum* Coult. & Rose, type from Frisco, Beaver County]. Plants 6–25 (34) cm tall, acaulescent, mostly scabrous, from a branched caudex, clothed at the base by persistent leaf bases; leaves bi- to tripinnately dissected, with (5) 7–11 opposite pairs of lateral primary leaflets; petioles 1–7 (10) cm long; blades (1.5) 2–11 cm long, lowest pair of primary leaflets less than 1/3 as long as the leaf blade, sessile or nearly so, the ultimate segments 50–400 or more, 1–4 mm long, 0.4–2 mm wide; peduncles 5–25 (32) cm long; rays of the umbel 4–11, 0.5–2 (3) cm long; bractlets of the involucrel 1–4 mm long, linear; pedicels 1–5 (10) mm long; petals and stamens mostly yellow or occasionally white when fresh, fading white in age; styles ca 2–3 mm long; fruit 4–7 mm long, 3–4 mm wide, the lateral wings to 1 mm wide, the dorsal ribs filiform or sometimes with a rudimentary wing at the base. There are two intergrading varieties.

1. Leaves mostly bipinnately dissected, with ca 50–110 (140) ultimate segments; fruit 4–8 mm long; plants mostly found above 1615 m *L. scabrum* var. *scabrum*
- Leaves tripinnately dissected, with ca 150–400 or more ultimate segments; fruit 6–9 mm long; plants mostly found below 1615 m *L. scabrum* var. *tripinnatum*

Var. *scabrum* Desert shrub, pinyon-juniper, mountain brush, and white fir communities, mostly on limestone and dolomite outcrops at 1615 to 2684 m in Beaver, Iron, Juab, and Millard counties; Nevada; a Great Basin endemic; 55 (xii). Some specimens, especially from Iron County, are wholly transitional to the following variety.

Var. *tripinnatum* Goodrich Blackbrush and pinyon-juniper communities, often on sandstone or in sandy places at 792 to 2170 m in Washington County; Arizona; a Virgin-Mohave endemic; 29 (ii).

Lomatium triternatum (Pursh) Coult. & Rose Ternate Lomatium. [*Seseli triternatum* Pursh]. Plants 2–7 dm tall, acaulescent or subacaulescent, mostly hirtellous throughout except the fruit, from a taproot with simple or sparingly branched crown, not clothed at the base with persistent leaf bases or only weakly so; leaves ternate-pinnately compound with (3) 9–21 leaflets or segments; petioles up to 23 cm long including the dilated sheathing base, or reduced to the sheath; blades 4–20 cm long, ovate in outline, the lowest primary leaflets often over 1/2 as long as the leaf blade, the ultimate leaflets or segments 1–13 cm long, 1–15 mm wide; peduncles 15–55 cm long; rays of the umbel 4–20, 2–10 cm long; bractlets of the involucre 6–10, 1–10 mm long, 0.1–0.5 mm wide; pedicels 2–7 mm long; petals and stamens bright yellow when fresh but fading to white in age; styles 1–1.5 mm long; fruit 8–15 mm long, 4–11 mm wide, the lateral wings 1–2.5 (4) mm long, the dorsal ribs filiform; n = 11. There are two subspecies.

1. Ultimate leaflets or segments linear, over 10 times as long as wide, to 13 cm long, 1–6 (10) mm wide; fruit broadly elliptic, the mature wings as broad or nearly as broad as the body *L. triternatum* ssp. *platycarpum*
- Ultimate leaflets elliptic, 3–9 times as long as wide, 2–6 cm long, (3) 6–15 mm wide; fruit rather narrowly elliptic to nearly linear, the mature wings seldom more than half as wide as the body *L. triternatum* ssp. *triternatum*

Ssp. *platycarpum* (Torr.) Cronq. [*Peucedanum triternatum* var. *platycarpum* Torr. in Stansbury, type from Great Salt Lake; *P. simplex* Nutt. ex Wats.; *L. simplex* (Nutt.) Macbr.]. Sagebrush-grass, pinyon-juniper, mountain brush, ponderosa pine, lodgepole pine, and dry meadow communities at 1310 to 2895 m in Box Elder, Cache, Daggett, Duchesne, Morgan, Rich, San Juan, Summit, Uintah, Utah, Wasatch, and Weber counties; British Columbia and Montana to Idaho and Colorado; 116 (viii).

Ssp. *triternatum* Mountain brush and aspen communities, sometimes on heavy clay soils with *Wyethia* at 1580 to 2590 m in Weber and Summit counties; southern Alberta and British Columbia to Utah; 8 (0). Utah specimens are referable to var. *anomalum* (Jones) Cronq. [*L. anomalum* Jones].

Musineon Raf.

Perennial plants with leaves mostly at or near the base, from a thickened taproot with a simple or branched crown or caudex; leaves 1 or more times pinnately or ternate-pinnately compound; umbel compound; involucre usually lacking; involucre of several separate or basally united bractlets; calyx teeth present, ovate; petals and stamens white or yellow; stylopodium lacking; carpophore entire to deeply cleft; fruit ovoid to linear oblong, somewhat laterally compressed, evidently ribbed.

Musineon lineare (Rydb.) Mathias Rydberg *Musineon*. [*Aletes tenuifolia* Coult. & Rose, type from Cache County; *Daucophyllum lineare* Rydb., type from near Logan]. Plants 5.5–25 cm tall, caulescent or subacaulescent, glabrous, from a mostly branched caudex, more or less clothed at the base with persistent leaf bases; leaves mostly on the lower 1/3 of the plants, ternate or more often pinnate, with 2–4 opposite pair of lateral leaflets; petioles 0.5–6 (14) cm long; blades 1–5.3 cm long; leaflets, sessile, entire or bifid, trifid or rarely pinnatifid, the ultimate leaflets or lobes 3–20 mm long; peduncles 5–22 cm long, slender; umbel solitary; rays 5–10, 1–5 mm long; involucels of ca 3 linear or narrowly elliptic bractlets 4–10 mm long; pedicels ca 1 mm long; calyx teeth ca 0.5 mm long, greenish or purplish with scarios margins; petals and stamens white; styles ca 1 mm long; fruit 2–4 mm long, minutely scabrous, the ribs evident but not winged. Limestone cliffs in the Bear River Range, Cache County; endemic; 4 (0).

Oreoxis Raf.

Caespitose, acaulescent herbs from branched woody caudices, these usually clothed with marcescent leafy bases; leaves pinnate or bipinnate; umbels compound; involucre mostly lacking; bractlets of the involucre more or less united at the base, usually exceeding the flowers; calyx teeth conspicuous; petals and stamens yellow at least when fresh; stylopodium lacking; carpophore lacking; fruit oblong to ovoid-oblong, slightly compressed laterally, the ribs corky-winged. Plants of the genus could reasonably be included in *Cymopterus* and with the recent discovery of the low elevation *O. trotteri* such inclusion might be necessary.

1. Bractlets obovate, toothed at the apex, usually purplish, plants of the La Sal Mts. *O. bakeri*
- Bractlets linear or narrowly elliptic, entire, acute to acuminate; plants of wide or other distribution 2
- 2(1). Plants pulvinate-caespitose, forming clumps to 30 cm wide, from low elevations in Grand County; caudex clothed with a thatch of terete leaf bases; ultimate segments elliptic to cuneate-ovate *O. trotteri*
- Plants caespitose but hardly pulvinate, from high elevations, widespread; caudex clothed with short, more or less flattened leaf bases; ultimate segments of leaves linear to linear-elliptic *O. alpina*

Oreoxis alpina (Gray) Coult. & Rose Alpine *Oreoxis*. [*Cymopterus alpinus* Gray]. Plants 2.5–11.5 cm tall, scabrous-hirtellous throughout, from a branched caudex, the caudex clothed with persistent leaf bases; leaves all basal, mostly bipinnate, with ca 4 opposite pair of sessile or nearly sessile lateral primary leaflets, the upper ones and those of smaller leaves sometimes once pinnate and then trifid to pinnatifid; petioles 0.5–2.5 cm long; blades 1–3.5 cm long oblong in outline, the lowest pair of primary leaflets 4–14 mm long, the ultimate segments 1–6 mm long, 0.4–1.5 mm wide, linear to narrowly elliptic; peduncles 2–10.5 cm long; umbel solitary; involucre lacking; rays 4–7, 1–6 mm long; involucels of 5–9 bractlets 1–4 mm long, united at the base; pedicels obsolete or to ca 0.3 mm long; calyx teeth 0.6–1 mm long, green; petals and stamens yellow when fresh, fading to white or cream or purple tinged in age; styles 1.7–2 (3) mm long; fruit 4–5 mm long, the ribs with low corky wings to ca 0.7 mm wide; 2n = 60. Forb-grass, limber pine, spruce, and

alpine communities, and raw escarpments and barren ridges at 2440 to 3475 m in Duchesne, Garfield, Grand, San Juan, Sanpete, Summit, and Wayne counties; Wyoming to New Mexico and Arizona; 27 (vi).

Oreoxis bakeri Coult. & Rose Plants 1–12 cm tall, slightly puberulent at base of umbels and rays; leaves basal, bipinnate for the most part or pinnate with pinnatifid or trifid leaflets, with 3–4 opposite pair of lateral primary leaflets, the petioles 0.8–2.5 cm long; blades 0.8–5 cm long, the lowest pair of primary leaflets to ca 1 cm long, sessile or nearly so, the ultimate segments to 7 mm long, to 1 mm wide; peduncles 1–11 cm long; umbels solitary, involucre lacking; rays 3–8, 3–5 mm long; bractlets of the involucre united at base, 3–5 mm long, nearly linear-elliptic to obovate, usually 3-toothed at the apex; petals and stamens yellow at least when fresh; styles to ca 1 mm long; fruit 2–4 mm long, the ribs with low corky wings to 0.75 mm wide. Alpine forb-grass communities at ca 3660 m in the La Sal Mts., Grand and San Juan counties; Colorado and New Mexico; 4 (0).

Oreoxis trotteri Welsh & Goodrich Plants pulvinate-caespitose, forming clumps to 30 cm wide, 4–8 cm tall, scabrous and more or less glandular, from a branching caudex, this clothed with a thatch of persistent, terete leaf bases and peduncles; leaves all basal, bipinnate, with ca 4 opposite pair of sessile, lateral, primary leaflets, the upper ones and those of the smaller leaves sometimes once-pinnate and then trifid or pinnatifid; petioles 1–3.5 cm long; blades 1.5–2.3 cm long, oblong in outline, the lowest pair of primary leaflets 3.5–5 mm long, the ultimate segments 1–3.5 mm long, 1–3 mm wide, elliptic to cuneate-ovate; peduncles 4–7.5 cm long; umbel solitary; involucre lacking; rays 5–7, 3–5 mm long; involucels of 4–7 linear-subulate bractlets 2–3.5 mm long, distinct or essentially so; pedicels obsolete or to ca 1 mm long; calyx teeth ca 1 mm long, green or purplish; petals and stamens yellow; styles 1–1.2 mm long; fruit 2.8–4.8 (5) mm long, the ribs with low, corky wings to 0.7 mm wide. Mixed juniper and warm desert shrub community at ca 1464 m in Grand (type from NW of Moab) County; endemic; 3 (i).

Orogenia Wats.

Perennial acaulescent glabrous low herbs from a fusiform or globose root; leaves ternate or biternate with linear entire leaflets; umbel compound; involucre lacking or of a few linear minute scarious bractlets; calyx teeth obsolete; petals and stamens white or purplish; stylopodium lacking; carpophore lacking; fruit oblong to oval, nearly round in cross section, the dorsal ribs evident or obsolete, the lateral ones corky winged but inflexed into the commissure, a corky riblike projection also running the length of the commissural faces of each mericarp.

Orogenia linearifolia Wats. Indian Potato. Plants 5–10 (13) cm tall, glabrous, not aromatic, from a globose or fusiform root, with a fragile etiolated subterranean scapose stem easily detached from the tuberous root; leaves borne at ground level or a few arising from the tuberous root with etiolated petioles, ternate or biternate blades 3–8 (12.5) cm long, the 3–9 leaflets 1.5–5 (11.5) cm long, 1–11 mm wide, linear, entire, the lowest pair of petiolules to 2 cm long; peduncles 3–8 cm long, usually a little longer than the subterranean stem; involucre lacking; rays 3–12, but rarely more than 5 of them fertile, 0.3–3 cm long; involucel proper apparently lacking but some of the pedicels usually bearing a linear bractlet to 4

mm long; pedicels nearly obsolete or to 2 mm long; petals white; filaments white, anthers pale or dark purple; styles ca 1 mm long; fruit 4–6 mm long; dorsal ribs filiform. Sagebrush-grass, mountain brush, aspen, ponderosa pine, white fir, and rarely desert shrub communities, mostly flowering at the edge of melting snow at 1370 to 2805 m in Beaver, Box Elder, Juab, Millard, Morgan, Salt Lake, San Juan, Sanpete, Sevier, Summit (type from Parleys Park), Tooele, Uintah, Utah, Wasatch, Washington, and Weber counties; Washington to Montana, south to Colorado; 50 (viii).

Osmorhiza Raf.

Perennial caulescent usually pubescent herbs from taproots with simple or branched crowns; leaves ternately or pinnately 1–3 times compound with well marked leaflets; umbels compound; involucre lacking or of 1 or a few narrow foliaceous bracts; involucel lacking or of several foliaceous reflexed bractlets; calyx teeth obsolete; petals and stamens white, greenish white, yellow, pink, or purple; stylopodium, conic to depressed; carpophore bifid less than 1/2 its length; fruit linear or clavate, somewhat compressed laterally, bristly hispid to glabrous, the ribs narrow.

1. Ovaries and fruit glabrous, generally obtuse at both ends; petals and stamens yellow or greenish yellow; leaves (1) 2 times pinnately or ternate-pinnately compound; plants strongly aromatic, usually with more than 2 stems *O. occidentalis*
- Ovaries and fruit bristly hispid, with long, pointed bristly hispid tails; petals white or greenish white; leaves biternate; plants not strongly aromatic, often with solitary stems 2
- 2(1). Mature fruit including tails mostly 16–25 mm long, the apex concavely pointed into a beak 1–2 mm long; fruiting pedicels mostly ascending-spreading *O. chilensis*
- Mature fruit including tails mostly 13–18 mm long, the apex convex and obtuse; fruiting pedicels horizontally spreading to ascending *O. depauperata*

Osmorhiza chilensis H. & A. [*O. nuda* Torr.]. Stems often solitary, 18–75 cm tall, from a taproot, without marcescent leaf bases; herbage not strongly aromatic; leaves basal and 2–3 cauline, biternate, usually with 9 distinct leaflets; petioles 3–16 cm long or cauline leaves sessile; blades 5–15 cm long, the lateral primary leaflets nearly as long as the central one, with petiolules (1) 2–5.5 cm long; blades of leaflets 1–4 (5.5) cm long, elliptic to ovate, lobed to cleft, and toothed, ciliate and often pubescent on nerves below and sometimes scattered pubescent between the nerves; peduncles 5–34 cm long; umbels 1–5; involucre lacking; rays 3–7, 2.5–9 (13) cm long, ascending or spreading-ascending, glabrous to hirtellous; involucels lacking; pedicels 5–22 (30) mm long, ascending; petals and stamens greenish white; styles less than 0.5 mm long; fruit including the tails 16–25 mm long, linear-clavate, bristly hispid, the beak concavely pointed, 1–2 mm long, the concave beak usually evident in young fruits; $n = 11$. Mountain brush, aspen, Douglas fir, white fir, narrowleaf cottonwood, and riparian communities at 1520 to 2680 m in Box Elder, Cache, Daggett, Davis, Duchesne, Juab, Millard, Salt Lake, Sanpete, Tooele, Uintah, Utah, Wasatch, Washington, and Weber counties; Alaska to California, east to Alberta and Arizona, also in Great Lakes region; Argentina and Chile; 54 (viii).

Osmorhiza depauperata Phil. Blunt-fruit Sweet-cicely. [*O. obtusa* (Coulter & Rose) Fern.]. Stems mostly solitary, 14–63 (77) cm tall, often with a slight ring of hairs at the nodes, from a taproot, without persisting leaf-bases; herbage not strongly aromatic; leaves basal and 1–3 cauline, biternate, usually with 9 distinct leaflets, or the upper cauline ones once-ternate; petioles (1) 3–17 cm long, often with dilated, ciliate bases; blades (2) 4–11 cm long, the lateral primary leaflets almost equal to the central one or a little shorter, with petiolules (0.5) 1–4 cm long, blades of leaflets 1–4 (5.5) cm long, elliptic to ovate, lobed to cleft and toothed, ciliate and often pubescent on nerves below and sometimes scattered pubescent between them; peduncles 3.5–15 (22.5) cm long; umbels 3–6; involucre lacking, or rarely of a solitary bract to 12 mm long; rays 3–5, 1.5–8.5 cm long, spreading to divaricate; involucels lacking or infrequently of 1 or 2 separate ciliolate bractlets to 3 mm long; pedicels 5–20 mm long, spreading to divaricate; petals greenish white; styles ca 0.2 mm long; fruit including the tails (11) 13–18 mm long, linear-clavate, the beak convex-obtuse; $n = 11$. Mountain brush, aspen, ponderosa pine, Douglas fir, lodgepole pine, spruce-fir, riparian, and rarely pinyon-juniper and sagebrush communities at 1980 to 3200 m in all Utah counties, except Cache, Davis, Emery, Morgan, Piute, Rich, and Wayne; Alaska to California, east to South Dakota and New Mexico; also in the Great Lakes Region; Chile and Argentina; 110 (xv).

Osmorhiza occidentalis (Nutt.) Torr. Western Sweet-cicely. [*Glycosma occidentalis* Nutt. ex T. & G.; *G. maxima* Rydb., type from Mt. Nebo]. Plants 6–13 dm tall, from a taproot, with few or no persistent leaf bases, strongly aromatic; leaves (1) 2 times pinnate or the upper cauline ones ternate pinnately compound, with 3–4 pairs of opposite lateral primary leaflets; petioles of lower leaves 4–30 cm long or longer, the upper ones reduced; lower blades to 25 cm long or longer, the upper ones much reduced, the lowest pair of primary leaflets usually again pinnate, usually over 1/2 as long as the leaf blade, with petiolules 1–3.5 cm long, the ultimate leaflets 1–9 cm long 0.5–4 cm wide, lanceolate to lance-elliptic or ovate coarsely toothed and some often lobed; peduncles 6–20 cm long; umbels 3–5; involucre lacking or occasionally of 1–2 linear or filiform bracts to 16 mm long; rays 7–13, 2–6.5 cm long; involucels lacking; pedicels 2–7 mm long; calyx obsolete; petals greenish white or greenish yellow, 1–2 mm long; stylopodium low; styles 0.7–1 mm long; carpophore divided to the base; fruit 16–20 mm long, 2–3 mm wide, linear, glabrous. Tall forb, aspen, oak-maple, spruce-fir, riparian, and infrequently in sagebrush communities at 1765 to 3170 m in Box Elder, Cache, Carbon, Duchesne, Iron, Juab, Millard, Morgan, Salt Lake, San Juan, Sanpete, Sevier, Summit, Tooele, Utah, Wasatch, Washington, and Weber counties; British Columbia and Alberta south to California and Colorado; 67 (xvi).

Oxypolis Raf.

Perennial, caulescent, glabrous herbs from fascicled tuberous roots; leaves pinnate; umbels compound; involucre and involucel lacking; rays ascending; calyx teeth conspicuous; petals white to purple; stylopodium conic; carpophore divided to the base; fruit oblong to oval, strongly flattened dorsally, with dorsal ribs filiform and lateral ribs broadly winged.

Oxypolis fendleri (Gray) Heller [*Archemora fendleri* Gray]. Plants 6–8 dm tall, without persistent leaf bases; leaves pinnate with 2–5 pairs of opposite lateral leaflets, the upper ones sometimes reduced to bladeless or nearly bladeless sheaths, the petioles (3) 5–15 cm long or the upper blades sessile on a dilated sheath; blades 7–17 cm long, oblong in outline, the leaflets sessile, 2–5 cm long, ovate to orbicular, shallowly to deeply crenate-dentate or serrate or rarely incised, or those of the upper leaves lanceolate to linear and sometimes entire; peduncles (1) 4–20 cm long; umbels usually 4 or more per stem; involucre lacking; rays 5–14, 1–5 (7) cm long, ascending; involucels lacking; pedicels 3–10 mm long; petals and stamens white; styles mostly less than 1 mm long; fruit 3–5 mm long. Streambanks on the Abajo and La Sal mts. in San Juan County; Wyoming south to New Mexico; 4 (0).

Pastinaca L.

Biennial or perennial caulescent herbs from large taproots; leaves pinnately compound, with broad toothed to pinnatifid leaflets; umbels compound; involucre and involucel usually lacking; calyx teeth obsolete; petals yellow or red; stylopodium depressed-conic; carpophore divided to the base; fruit elliptic to obovate, strongly flattened dorsally, the dorsal ribs filiform, the lateral ones narrowly winged.

Pastinaca sativa L. Parsnip. Biennial caulescent aromatic herbs 8–15 dm tall, from a taproot; leaves pinnate or partly bipinnate in some of the lower leaflets, with 3–6 opposite or offset pair of lateral leaflets; petioles 3–15 mm long or lacking and the blade sessile on a dilated sheath; blades 12–35 cm long or longer, oblong in outline; leaflets sessile and sometimes confluent or the lower ones sometimes on petiolules to 1.7 cm long, the blades 2.5–12 cm long, lanceolate to ovate, coarsely serrate, and often lobed; umbels 6–15 or more, the terminal one sessile or pedunculate but shorter than the 2 immediately lateral ones, the lateral umbels alternate or opposite or on opposite branches supporting 2 or more umbels; involucre lacking or of 1 to few linear entire or occasionally toothed or lobed bracts to 2 (4) cm long; rays 9–25, 0.8–8.5 cm long; involucels lacking or infrequently of 1–2 linear bractlets to 2 mm long; pedicels 4–20 mm long; petals greenish yellow or reddish; styles 0.4–1 mm long; fruit 5–8 mm long, 3–6 mm wide, broadly elliptic to orbicular or obovate, strongly flattened dorsally the dorsal ribs filiform and the lateral ones slightly winged. Ditchbanks, roadsides, fencelines, gardens, fields, margins of ponds and lakes, and moist flood plains at 1370 to 2365 m, cultivated in all counties of the state, escaping and persisting, introduced from Europe, now widely established in North America; 23 (x). The cultivated plants, ssp. *sativa*, differ from the wild plants ssp. *silvestris* (Miller) Rouy & Camus, in having larger roots. Some of the wild plants might be recent escapes from cultivation.

Perideridia Reichenb.

Perennial, caulescent herbs from a fusiform or tuberous root, these often deep-seated and easily detached from the rather fragile etiolated subterranean portion of the stem, and often lacking in herbarium specimens; leaves ternate, pinnate, or ternate-pinnately compound, the upper ones sometimes reduced to a simple, linear rachis; petioles sheathing; umbels compound; involucre lacking or of mostly few more or less scarious bracts;

involucel lacking or of 1 to few bractlets; calyx teeth inconspicuous, of the texture and color of the petals; petals white; stamen white; stylopodium conic or low conic; carpophore divided to the base; fruit linear-oblong to orbicular, scarcely compressed or lightly so at right angles to the commissure, with filiform ribs.

1. Bractlets of the involucel scarious, as wide or to 5 times as wide as the pedicels, 3–5 mm long; longest rays rarely over 2 cm long; lower leaves with ultimate divisions 10–50 or more *P. bolanderi*
- Bractlets of the involucel not scarious or with narrow scarious margins, only about as wide as the pedicels, to 3 mm long; longest rays 2–3 (4) mm long; leaves commonly with 3–5 leaflets *P. gairdneri*

Perideridia bolanderi (Gray) Nels. & Macbr. Yampah. [*Podosciadium bolanderi* Gray]. Plants 23–40 cm tall, glabrous, without marcescent leaf bases; leaves often crowded on the lower part of the stem, ternate-pinnately 2 or more times compound, with petiolulate primary leaflets, the upper ones reduced and sometimes simple and linear, often withered before or shortly after anthesis; petioles to 4 cm long or lacking and the petiolules arising directly from a dilated sheath; blades 4–12 cm long, the ultimate leaflets strongly dimorphic, 0.2–8 cm long, mostly 10–50 or more per leaf on the lower leaves; peduncles (2) 5–14 cm long; umbels 2–6 per stem; involucre lacking or usually of 1–4 scarious bracts to 5 mm long; rays 4–12, 1–2 cm long; bractlets of the involucels 4–8, 3–5 mm long, to 2.5 mm wide, linear to ovate and often caudate, with pale yellow green midrib, this often flanked on either side by purple and then by conspicuous scarious margins; pedicels 3–6 mm long; petals white; styles 1–2 mm long, spreading to recurved; fruit 3–4 (5) mm long, some of the ribs usually conspicuously ridged; $n = 19$. Sagebrush, juniper, mountain brush, and stream side communities, sometimes in snow flush areas at 1524 to 2320 m in western Box Elder County and Deep Creek Mts., Juab County; Oregon and Idaho south to California; 12 (iii). This plant was an important source of food for Indians and early explorers.

Perideridia gairdneri (H. & A.) Mathias False Yarrow. [*Atenia gairdneri* H. & A.; *Carum garrettii* A. Nels. in Coult. & Rose, type from the Wasatch Mts.]. Plants 1.5–7.5 dm tall, glabrous, without marcescent leaf bases; leaves 2–5 per stem, ternate or pinnate, with 3–5, or rarely more, sessile leaflets, the upper ones reduced and often simple and linear; leaflets to 13 cm long, mostly confluent with the rachis, linear and hardly wider than the petiole, occasionally expanded and to 11 mm wide; peduncles (1) 2–5 (7) cm long; umbels 2–5 per stem; involucre lacking or occasionally of 1 or 2 linear bracts to 6 mm long; rays 7–16, 0.7–4 cm long; bractlets of the involucels lacking or more often 1–6, 1–3 mm long, linear or linear-subulate, hardly if at all wider and conspicuously shorter than the pedicels, not marked with purple or, if so, the whole bractlet mostly purple; pedicels 3–5 mm long; petals white or turning purplish; styles to 1 mm long, recurved; fruit 2–3 mm long, orbicular, the ribs obscure; $n = 19$. Sagebrush, forb-grass-sagebrush, meadow, oak, maple, aspen, and willow communities at 1680 to 2685 m in Box Elder, Cache, Daggett, Juab, Salt Lake, Sanpete, Summit, Utah, and Wasatch counties; British Columbia to California, east to Saskatchewan and New Mexico; 25(v). Our plants belong to ssp. *borealis* Chuang & Const.

Podistera Wats.

Perennial acaulescent glabrous plants from taproots or branched caudices; leaves pinnate with deeply lobed leaflets; umbel solitary, compound, compact; involucre wanting; involucre of toothed bractlets; calyx teeth conspicuous, ovate; petals greenish yellow; stylopodium conic; carpophore stout, undivided; fruit oval, slightly flattened laterally, the ribs filiform to prominent.

Podistera eastwoodiae (Coult. & Rose) Mathias & Const. [*Ligusticum eastwoodae* Coult. & Rose]. Plants 7–20 (30) cm tall, acaulescent, without or with few marcescent leaf bases; leaves pinnate, with 4–6 pairs of sessile lateral leaflets; petioles 1.5–7 cm long; blades 2.5–7.5 cm long, oblong in outline; leaflets 1–2 cm long, ovate to obovate in outline, ternately or palmately lobed or cleft, the larger lobes again toothed or lobed; peduncles (7) 10–20 (30) cm tall; involucre lacking; rays 5–8, 2–8 mm long; bractlets of the involucre 4–6 mm long, often exceeding the flowers and fruit, ovate or obovate, with 2–3 teeth or lobes, with the texture and color of the leaves; pedicels 1–2 mm long; petals greenish yellow, turning purple; styles ca 1 mm long; fruit 3–4 mm long, the ribs evident but not winged. Apparently rare at upper elevations of the La Sal Mts., Grand and San Juan counties, Colorado and New Mexico; 1 (0).

Sium L.

Perennial, caulescent herbs from fascicles of fibrous roots; leaves mostly pinnately compound or decomposed, with well marked, toothed to pinnatifid leaflets; umbels compound; involucre of entire or incised, often reflexed bracts; involucre of narrow bractlets; calyx teeth minute or obsolete; petals white; stylopodium depressed or rarely conic; carpophore divided to the base (but threadlike and adnate to the faces of the mericarps); fruit elliptic to orbicular, slightly compressed laterally and somewhat constricted at the commissure, the subequal ribs prominent and corky but hardly winged.

Sium suave Walter Hemlock Water-parsnip. Plants 5–10 dm tall; leaves pinnate or occasionally partly bipinnate, with 4–6 opposite pairs of sessile lateral leaflets, the lower petioles to 25 cm long, often septate, the upper ones smaller and sometimes reduced to a dilated sheath; lower blades 14–32 cm long, the upper ones reduced; leaflets 2–8 (15) cm long, (1) 3–8 (20) mm wide, linear to lanceolate, sharply and uniformly serrate to pinnatifid with linear segments; peduncles 4–10 cm long; umbels 3–11 or more per stem; involucre of 1–6 separate, often reflexed bracts 2–9 mm long; rays 11–24, 1.5–3 cm long; involucels of (2) 5–12 separate bractlets 2–5 mm long; pedicels 2–8 mm long; petals and stamens white; styles ca 1 mm long; fruit 2–3 mm long, the ribs prominent; $2n = 6, 12, 22$. Mud flats, marshlands, wet meadows, along streams and shorelines, and in ponds and lakes at 1365 to 2990 m in Garfield, Piute, Rich, Salt Lake, Sanpete, Sevier, Utah, and Wayne counties; British Columbia to Newfoundland, south to California and Virginia; 15 (i). This species is often mistaken for *Cicuta*, and is frequently found with that genus in herbaria, but differs conspicuously in the merely pinnate leaves.

Torilis Adanson

Annual caulescent hispid or pubescent herbs from slender taproots; leaves 1–2 times pinnate or pinnately de-

compound; petioles sheathing; umbels compound, capitate or open, sessile or pedunculate; involucre lacking or of a few small bracts; involucre of several linear or filiform bractlets; calyx teeth evident to obsolete; petals white; stylopodium thick, conic; carpophore bifid or cleft ca 1/3-1/2 its length; fruit ovoid or oblong, flattened laterally, tuberculate or prickly, the primary ribs filiform, setulose, the lateral ribs displaced onto the commissural surface, the intervals covered with glochidiate prickles or tubercles.

Torilis arvensis (Hudson) Link Hedge Parsley. [*Caucalis arvensis* Hudson]. Plants 3-10 dm tall, divaricately branched, appressed-hispid throughout, retrorsely so on the stems and antorsely so on the leaves and rays; leaves 2-3 times pinnate, or the upper ones once-pinnate, the ultimate leaflets 5-60 mm long, 2-20 mm wide, ovate to linear lanceolate, acute or acuminate, regularly incised or divided; peduncles 2-12 cm long; involucre lacking or of a single small bract; rays 2-10, 0.5-2.5 cm long; involucre of several subulate bractlets longer than the pedicels; pedicels 1-4 mm long; petals white; styles short; fruit ovoid-oblong, 3-5 mm long, the mericarps densely covered with straight glochidiate prickles with minute retrorse barbs, these spreading almost at right angles and about as long as the fruit is wide; 2n = 12. The species was taken from an orchard (Barnum 1316 BRY) in Washington County; adventive; introduced from southern and central Europe; 4 (0). This plant was observed growing abundantly in an orchard in La Verkin in 1983.

Yabea Kozo-Polj.

Annual caulescent herbs from taproots; leaves pinnate or dissected; umbels compound; involucre of a few entire or dissected usually somewhat scarios bractlets; calyx teeth evident; petals white; stylopodium thick and conic; carpophore entire or bifid at the apex; fruit oblong or ovoid, somewhat compressed laterally, with spreading uncinately prickles along alternating ribs and bristly-hairy on the other ribs.

Yabea microcarpa (H. & A.) Kozo-Polj. California Hedge-parsley. [*Caucalis microcarpa* H. & A.]. Plants annual, caulescent, 8-40 cm tall, pubescent with spreading hispid hairs, from a slender taproot; leaves 2-3 (4) times pinnate or ternate-pinnate, with ca 3-4 opposite pairs of lateral primary leaflets; blades 1-5 cm long, oblong or ovate in outline, on petioles 1-4.5 cm long or the upper ones sessile, the lowest pair of primary leaflets almost 1/2 as long as the leaf blade, sessile or petiolulate, the ultimate segments 1-8 mm long, 0.5-2 mm wide; peduncles 3-10 cm long; umbels 1-4; involucre resembling the upper leaves or a little smaller; rays (1) 2-7 (9), 1.5-10 cm long, often about as long as the peduncles; involucels similar to the involucre, but usually reduced to much reduced and the bractlets merely pinnatifid or entire; pedicels 5-15 cm long; petals white; stamens white; styles very short; carpophore bifid for ca 1/5 its length; fruit 3-7 mm long. The one specimen seen (Atwood 4871 BRY) is from the Pine Valley Mts., Washington County; British Columbia south to Baja California, east to Idaho and Arizona; 1 (0).

Zizia Koch

Perennial glabrous or subglabrous herbs with basal and cauline leaves, from a short caudex and a cluster of fleshy-fibrous roots; leaves simple or ternate, with toothed

blades or leaflets; umbels compound; involucre lacking or obsolete; involucre of a few inconspicuous bractlets; calyx teeth well developed; petals bright yellow; stylopodium lacking; carpophore bifid about half its length; fruit oblong or broadly elliptic, somewhat laterally compressed, the ribs prominent but not winged.

Zizia aptera (Gray) Fern. [*Thaspium trifoliatum* var. *apterum* Gray]. Perennial, caulescent, glabrous herbs 15-50 cm tall, from a taproot or fascicle of roots, without marcescent leaf-bases; basal leaves simple, rarely ternate; petioles 3-18 cm long; blades 1.5-5 cm long, ovate to nearly orbicular, cordate, crenate-serrate; cauline leaves ternate, not over 3 cm long, the leaflets sessile or on petiolules to 4 mm long; peduncles 6-12 cm long; umbels 1 or 2 per stem; involucre lacking or obsolete; rays 10-17, 0.5-2 cm long; involucels of 4-6 bractlets, to ca 2 mm long, separate or united at the base; pedicels 1-3 mm long; petals yellow; stamens yellow; styles ca 1 mm long; fruit ca 2 mm long, the ribs prominent. Willow-streamside and meadow communities at 2130 to 2440 m in Sanpete, Sevier, Summit, Utah, and Wasatch counties; widespread in the U. S. and Canada; 12 (iii).

URTICACEAE A. L. Juss.

Nettle Family

Annual or perennial herbs; leaves opposite or alternate, simple, with or without stinging hairs; plants monoecious or dioecious; flowers hypogynous, imperfect, inconspicuous, arranged in spicate cymes or small cymose clusters; staminate flowers with 3-6 sepals and 3-6 stamens; pistillate flowers with 4 or 5 sepals or the perianth lacking; pistil 1, the ovary superior, 1-loculed; style 1; stigma 1; fruit an achene; x = 6-14.

- 1. Leaves alternate, entire; plants lacking stinging hairs *Parietaria*
- Leaves opposite, toothed; plants with stinging hairs *Urtica*

Parietaria L.

Annual, monoecious or perfect herbs, lacking stinging hairs but often otherwise pubescent; leaves simple, alternate, entire, estipulate; flowers borne in bracteate axillary clusters, the perianth 4-lobed; stamens 4; ovary superior; stigma tufted; fruit an ovoid achene.

Parietaria pennsylvanica Muhl. ex Willd. Hammerwort. Plants sprawling to erect, simple or branched, 4-50 cm tall; leaves petiolate, the blades 4-50 mm long or more, 3-25 mm wide, lanceolate to ovate or elliptic, strigulose, hirsute (the hairs often with pustular bases), or glabrous, ciliate; flowers in bracteate clusters; perianth 1.5-2.2 mm long, more or less cylindrical-campanulate, green to brownish; achenes smooth, shining, tan, 0.9-1.3 mm long; 2n = 16. Warm desert shrub, hanging garden, and ruderal habitats at 850 to 1740 m in Box Elder, Cache, Daggett, Kane, Millard, Salt Lake, Uintah, and Washington counties; British Columbia to the Atlantic, south to California, Mexico, and Alabama; 18 (ii). Use of relative length of bracts versus calyx, absolute length of calyx, and degree of harshness of pubescence are not apparently reliable for segregation of our specimens into the proposed species identified from Utah. Our plants have passed under the names *P. floridana* Nutt., *P. occidentalis* Rydb., and *P. obtusa* Rydb., and some of those

might be valid elsewhere, but our materials belong to a single variable taxon, fitting into a continuous graded series.

Urtica L.

Perennial or annual, monoecious to dioecious herbs armed with stinging hairs (and otherwise pubescent); leaves simple, opposite, toothed, stipulate; flowers in axillary spicate cymes, the perianth 4-lobed; staminate flowers with 4 stamens and a rudimentary pistil; ovary superior, the stigmas tufted; fruit a lenticular achene.

Fernald, M. L. 1926. *Urtica gracilis* and some related North American species. *Rhodora* 28: 191-99.

Woodland, D. W. 1982. Biosystematics of the perennial North American taxa of *Urtica*. II. Taxonomy. *Syst. Bot.* 7: 282-290.

1. Plants rhizomatous perennials; stipules more than 5 mm long; plants widespread *U. dioica*
- Plants taprooted annuals; stipules less than 5 mm long; plants known from nearby in Nevada *U. urens* L.

Urtica dioica L. Stinging Nettle. Perennial rhizomatous herbs; stems 6-20 dm tall, bearing stinging hairs and otherwise hairy to subglabrous; leaves 4-18 cm long, the petioles 1-6 cm long, the blades 3-15 cm long and 1-8 cm wide, linear-lanceolate or lanceolate to ovate, coarsely serrate, acute apically, the base cordate to truncate or acute; stipules 5-15 cm long; flowers inconspicuous, the perianth 1-2 mm long, greenish; $2n = 26$. Two geographically correlated varieties are present in Utah.

1. Lower leaf surface glabrous or essentially so, except for occasional stinging hairs; stems not obscured by pubescence; plants of eastern Utah *U. dioica* var. *procera*
- Lower leaf surface more or less densely hirtellous; stems usually obscured by pubescence; plants mainly of the western 2/3 of Utah *U. dioica* var. *occidentalis*

Var. *occidentalis* Wats. [*U. holosericea* Nutt.; *U. dioica* var. *holosericea* (Nutt.) C. L. Hitchc.; *U. dioica* ssp. *holosericea* (Nutt.) Thorne; *U. brewerii* Wats.]. Riparian and palustrine habitats but also in xeric sites in mountain brush, sagebrush, aspen and Douglas fir communities at 1370 to 2595 m in Cache, Carbon, Daggett, Davis, Duchesne, Garfield, Juab, Millard, Piute, Salt Lake, Summit, Tooele, Uintah, Utah, Wasatch, Washington, Wayne, and Weber counties; Washington to Montana, south to Mexico and Colorado; 43 (iii). A specimen from Utah County (Allred 450 BRY) is intermediate with the following in pubescence features.

Var. *procera* (Muhl.) Wedd. [*U. procera* Muhl. ex Willd.; *U. gracilis* Ait.; *U. dioica* var. *gracilis* (Ait.) Taylor & MacBryde; *U. dioica* ssp. *gracilis* (Ait.) Selander; *U. lyallii* Wats.; *U. dioica* var. *lyallii* (Wats.) C. L. Hitchc.]. Mountain brush, sagebrush, aspen, and spruce communities (often in moist sites) at 2135 to 3050 m in Grand, San Juan, and Uintah counties; widely distributed in North America; 7 (i).

VALERIANACEAE Batsch

Valerian Family

Annual or perennial herbs; leaves opposite, estipulate; flowers epigynous, small, perfect or unisexual, borne in cymes or heads; calyx a ring, reduced, or lacking,

variously toothed, often inrolled in flower and forming a leathery pappus in fruit; corolla funnelliform to rotate or nearly salverform, 4- or 5-lobed, the base saccate or spurred; stamens 1-4, inserted near the base of the corolla tube; pistil 1, the ovary superior, mostly 3-loculed, with 2 of the locules sterile; ovule 1, pendulous; fruit dry, achene-like, indehiscent, sometimes plumose or winged; $x = 7-12$.

1. Stamen 1; corolla with a long spur, usually magenta or red, rarely white, more than 1 cm long; plants perennial, cultivated and persisting *Centranthus*
- Stamens 3; corolla gibbous or spurred at the base, white, pink, or bluish to purple, less than 1 cm long 2
- 2(1). Calyx limb of plumose bristles in fruit; plants perennial, mostly from rhizomes or taproots *Valeriana*
- Calyx limb lacking; plants annual, from taproots 3
- 3(2). Flowers in cymose clusters, forming a more or less flat-topped inflorescence; stems dichotomously branched; plants annual, introduced *Valerianella*
- Flowers densely clustered in capitate or interrupted spikelike inflorescences; plants annual, indigenous *Plectritis*

Centranthus DC.

Glaucous annual or perennial herbs; stems erect; leaves entire, dentate, or pinnatifid; flowers small, red to white; calyx dissected into 5-15 linear lobes, inrolled at anthesis, in fruit spreading and enlarging; corolla tube slender, spurred basally, the limb 5-lobed; stamen 1; fruit 1-loculed, narrow, crowned with the pappuslike calyx, 1-seeded.

***Centranthus ruber* (L.) DC.** [*Valeriana rubra* L.]. Plants glabrous, glaucous, 3-7 dm tall; leaves sessile, 3-10 cm long, lance-ovate to ovate, entire; flowers fragrant, red to pink or white, densely clustered; corolla tube 10-13 mm long, the spur elongate, slender, the limb spreading; stamen exerted; fruit 3-4 mm long; $2n = 32$. Cultivated ornamental, rarely escaping at 930 to 1533 m in Davis, Salt Lake, Utah, and Washington counties; widely grown in the U. S.; introduced from Europe; 5 (0).

Plectritis DC.

Annual herbs, glabrous or nearly so; stems erect, sparingly branched, with tufts of hair at the nodes; leaves entire or few-toothed, short-petiolate or sessile; flowers in capitate or interrupted spicate clusters; bracts linear-subulate; calyx obsolete; corolla small, bilabiate, 5-lobed, funnelliform, spurred at base; stamens 3; stigma usually bilobed; ovary inferior, 1-loculed; fruit an achene.

***Plectritis macrocera* T. & G.** Plants 1-6 dm tall; stems often glandular-pubescent above; leaves 1-6 cm long, 4-25 (40) mm wide, obovate to oblong or linear, the lower ones short-petiolate, becoming sessile upward; corolla 2-5 mm long, white to pale pink, irregular to nearly regular, with 5 short lobes, the spur thick, to 1.5 mm long; fruit 2-3 mm long, yellowish, with broad wings, glabrous or puberulent; $2n = 32$. Sagebrush, pinyon-juniper, mountain brush, and ponderosa pine communities at 1533 to 2330 m in Box Elder, Davis, Millard, Salt Lake, Tooele, Utah, and Weber counties; British Columbia to Montana, south to California; 17 (ii).

Valeriana L.

Perennial, strongly scented herbs from rhizomes or caudices; stems leafy or subscapose; leaves opposite, entire to pinnatifid; flowers cymose or in branched clusters; calyx inconspicuous, involute, finally spreading, the limb sessile, hyaline, becoming setose, the setae plumose and pappus-like; corolla rotate to funnellform, the tube somewhat gibbous at the base, throat more or less hairy, the 5 lobes subequal; stamens 3; ovary inferior, basically 3-loculed, maturing 1 pendulous ovule; style 1; stigma 3-lobed; fruit an achene.

1. Leaves mostly ligulate-spatulate, gradually tapering to clasping bases, the cauline ones often pinnatifid and more or less decurrent; plants from vertical, usually forked taproots *V. edulis*
- Leaves mostly pinnatifid, generally petiolate; plants rhizomatous 2
- 2(1). Corolla 7–13 mm long, tubular-funnelform, the tube commonly longer than the limb; basal leaves broadly elliptic, ovate, or suborbicular, with bases rounded, subcordate, or short-cuneate *V. arizonica*
- Corolla 7 mm long or less, funnellform-campanulate; leaves various 3
- 3(2). Corolla tube short, the limb widely flaring (rotate or nearly so), 2–3.5 mm long; leaves mostly oblong in outline, the lateral segments of stem leaves commonly broadly lanceolate to elliptic, obtuse to acute *V. occidentalis*
- Corolla funnellform, 4–6 mm long; leaves ovate to spatulate in outline, the lateral segments of cauline leaves usually narrowly lanceolate and acuminate .. *V. acutiloba*

Valeriana acutiloba Rydb. [*V. capitata* ssp. *acutiloba* (Rydb.) F. C. Meyer; *V. pubicarpa* Rydb., type from Mt. Nebo; *V. acutiloba* var. *pubicarpa* (Rydb.) Cronq.; *V. puberulenta* Rydb., type from near Marysville; *V. utahensis* Gand., type from Utah]. Plants from a stout rhizome or caudex with fibrous roots; stems erect, 1–6 dm tall, sparingly spreading hairy; leaves mainly 3–8 cm long and 1.5–3.7 cm wide, petiolate, the basal ones mostly simple, obovate to oblong or ovate, entire; cauline leaves entire to pinnatifid; calyx segments 10–17, plumose; corolla white to pinkish, 4–6 mm long, funnellform, the lobes 1–2 mm long; stamens exerted; fruit 3.5–5 mm long, puberulent to glabrous. Mountain brush, aspen, spruce-fir, and alpine tundra communities at 2240 to 3920 m in Beaver, Box Elder, Cache, Carbon, Duchesne, Juab, Kane, Morgan, Piute, Salt Lake, Summit, Tooele, Utah, Wasatch, and Weber counties; Oregon to Montana, south to California, Arizona, and New Mexico; 49 (vi). Treatment of our material as a portion of an expanded *V. capitata* is not without merit.

Valeriana arizonica Gray Plants from slender rhizomes; stems mostly 20–30 cm tall, glabrous; leaves petiolate, mostly basal, subentire or sometimes pinnatifid, 4–17 cm long, 15–40 mm wide, ovate to suborbicular; calyx segments 10–12; corolla white or pinkish, 7–13 mm long, tubular-funnelform, the lobes 2–2.5 mm long; stamens and style exerted; fruit 2–5 mm long, glabrous. Moist canyon, west rim of Zion National Park, Washington County (Cottam 6975 BRY); Arizona to Texas and Mexico; 1 (0).

Valeriana edulis Nutt. ex T. & G. Plants from taproot and caudex, this clothed with black, marcescent leaf

bases; stems erect, 1–10 dm tall, glabrous or nearly so; leaves thick, the basal ones 7–40 cm long, 7–50 mm wide, linear to obovate, entire or essentially so; cauline leaves 1–3 pairs, sessile or nearly so, usually pinnatifid, with 3–7 lanceolate to linear lobes; inflorescence elongate, open; calyx segments plumose, 9–13; corolla 1.5–3 mm long, rotate, yellowish to whitish; fruit 2.5–5 mm long, glabrous or pubescent; $2n = 64$. Sagebrush, aspen, lodgepole pine, spruce-fir, and alpine tundra communities at 1500 to 3700 m in all Utah counties, except Davis, Juab, Millard, Morgan, Rich, Tooele, Washington, and Weber; British Columbia to Ohio, south to Mexico; 64 (xiii). This is perhaps the most ill-scented of the valerian species in Utah.

Valeriana occidentalis Heller Plants rhizomatous; stems erect, 3–8 dm tall, glabrous or puberulent; basal leaves mainly 3–25 cm long, petiolate, elliptic to lanceolate or spatulate, entire or with 1 or 2 pairs of lateral lobes; cauline leaves sessile or short-petiolate, ovate to lanceolate, pinnatifid, with 3–9 lobes, these lanceolate to elliptic; calyx segments 9–15, plumose; corolla 2–3.5 mm long, rotate or campanulate, whitish, the lobes subequal to the tube; fruit 4–5 mm long, pubescent to glabrous. Sagebrush, mountain brush, aspen, spruce-fir, sedge-grass, and sedge- or grass-forb, and alpine tundra communities at 1830 to 3720 m in all Utah counties, except Kane, Morgan, Rich, and Washington; Oregon to North Dakota, south to California, Arizona, and Colorado; 83 (xi).

Valerianella Miller

Annual or biennial herbs; stems erect, branched above; leaves somewhat succulent, opposite, mostly entire; flowers small, in cymose clusters, whitish or pale bluish, bracteate; calyx limb obsolete or toothed; corolla funnellform or salverform, often gibbous or minutely spurred, the limb equally 5-lobed; stamens 3; ovary 3-loculed; stigma 3-lobed; fruit 3-loculed, but 2 of them sterile.

Valerianella locusta (L.) Betsche [*Valeriana locusta* L.]. Stems dichotomously branched above, mainly 1–3.5 dm tall, pubescent; lower leaves petiolate, spatulate, entire, the upper ones oblong-ovate, sessile, entire or few toothed, all ciliate, 1–7 cm long, 3–15 mm wide; flowers in clusters 5–13 mm wide; corolla 1–2 mm long, funnellform, white with bluish lobes; fruit 2–4 mm long, glabrous to puberulent, the central locule with a thick corky mass dorsally, the lateral locules sterile, narrow, with a shallow groove between them; $2n = 14, 16$. Sagebrush and mountain brush communities at ca 1533 m in Salt Lake County; introduced from Europe, now widely established in the U. S.; 1 (0).

VERBENACEAE St. Hil.

Vervain Family

Herbs or shrubs; leaves mostly opposite, simple, estipulate; inflorescence cymose, racemose, or of spikes or panicles; flowers sessile or pedicellate, perfect or sometimes imperfect, more or less irregular; calyx persistent, 2– to 4 (5)-toothed or -lobed; corolla regular or irregular, funnellform or salverform, usually with a well-developed tube, the limb commonly 4– or 5-lobed; stamens 4 and didymous or rarely 2 or 5, inserted on the corolla tube; pistil 1, the ovary superior, 2– to 4-loculed, the ovules 1

per locule; style simple, with 1 or 2 stigmas; fruit dry, of 2-4 nutlets; $x = 5-12$.

- 1. Calyx and corolla 5-lobed or 5-toothed; nutlets 4; plants common *Verbena*
- Calyx 2- to 4-lobed; corolla 4-lobed; nutlets 2; plants uncommon 2
- 2(1). Plants shrubs; flowers scattered, in slender elongate spikes or spikelike racemes; bracts narrow, not closely subtending the flowers *Aloysia*
- Plants herbaceous; flowers in dense, short-spicate or subcapitate spikes; bractlets broad, imbricate, closely subtending the flowers *Phyla*

Aloysia Ortega

Sweet-scented aromatic shrubs; leaves opposite, simple, the blades toothed; flowers small, in open leafy panicles composed of slender elongate spikes or spicate racemes; bractlets narrow, inconspicuous to conspicuous; calyx tubular-campanulate, usually spreading hairy or villous, not inflated at maturity, the tube angled, not flattened, 4-lobed; corolla salverform, 2-lipped, somewhat unequal; stamens 4, didymous, included; ovary 1- or 2-loculed; fruit a small, dry schizocarp.

Aloysia wrightii (Gray) Heller ex Abrams [*Lippia wrightii* Gray]. Shrubs to 15 dm tall; stems slender, brittle, the wood bright yellow, the bark readily peeling in long thin filamentous strips, the young twigs densely grayish puberulent; leaves small, ovate to rotund, 2-15 (30) mm long, 2-17 mm wide, rounded, crenulate or serrulate, strigulose-scabrous above, very densely tomentulous beneath with resinous-glandular, grayish or yellowish hairs, the venation deeply impressed above; inflorescence exceeding the leaves; spikes 1-4 cm long, densely many-flowered, the bractlets 1.5-2 mm long, lanceolate, long-acuminate, densely puberulent; corolla white, ca 2.5 mm long, puberulent externally, the limb ca 2 mm wide. Rare plants of rocky slopes, ledges, and limestone hills with creosote bush, blackbrush, yucca, and various cacti at ca 1200 m in Washington County; Nevada and Arizona, to New Mexico, Texas, and Mexico; 4 (ii). The plants flower in late summer and early autumn.

Phyla Lour.

Perennial, procumbent or prostrate herbs with trailing or ascending stems, sometimes woody near the base, glabrate to canescent-strigulose; leaves opposite, dentate apically; inflorescence a dense spike, axillary, cylindric, elongate in fruit; flowers small, sessile, borne singly in axils of cuneate-obovate bractlets, not at all 4-ranked.

- 1. Plants densely matted, more or less densely strigose-canescenscent throughout; leaves very small and cuneiform; known from Washington County *P. nodiflora*
- Plants forming open mats, finely strigulose; leaves 1-1.5 cm long or more, narrowly cuneate-spatulate, not of Washington County *P. cuneifolia*

Phyla cuneifolia (Torr.) Greene Wedge-leaf Frogfruit.

[*Zapania cuneifolia* Torr.; *Lippia cuneifolia* (Torr.) Steudel in Marcey]. Stems prostrate to procumbent, branching from a woody base, often rooting at the nodes, somewhat flexuous, with short, erect branches at the nodes; leaves sessile, thick-textured, linear-oblanccolate or cuneiform, 1-5 cm long, 2-8 mm wide, acute, with 2-8 teeth above the middle, gradually cuneate basally,

appressed-strigulose on both surfaces; inflorescence shorter than or slightly longer than the leaves; peduncles 0.8-5 cm long; heads globose at first, finally elongating and cylindrical, to 2 cm long and 8-12 mm wide; bractlets conspicuous, obovate, ca 5 mm long, abruptly long-acuminate; corolla whitish to reddish or purplish, the tube 4-5 mm long. Gravel bars and sandy terraces at 1190 to 1550 m in Carbon, Grand, Millard, Uintah, Utah, and Wayne counties; South Dakota and Wyoming to Arizona, Texas, and Mexico; 10 (iv). The only known report of this species from Millard County is from near Flowell, where it served as the host plant for *Cuscuta warneri* Yuncker. The parasite has not been relocated since the initial (and only) collection in 1957.

Phyla nodiflora (L.) Greene [*Verbena nodiflora* L.].

Plants matted, more or less carpetlike, somewhat woody basally, cinereous-strigulose; leaves pale green, narrowly oblanceolate to obovate, entire to toothed from below the middle, mainly 4-15 mm long, acutish apically; peduncles mostly 1.5-3 cm long; spikes ovoid, mostly 5-8 (10) mm long, 6 mm broad; bracts ovate; calyx ca 1 mm long; corolla rose to white, 4-5 mm long; $2n = 36$. Cultivated ground cover, escaping along ditch banks and roadsides below 1200 m in Washington County; California to Texas and South America; 3 (iii).

Verbena L.

Annual or perennial herbs; stems and branches procumbent, ascending, or erect, glabrous or pubescent; leaves mostly opposite; flowers small or medium, bracteate, in terminal corymbose or paniculate spikes; calyx usually tubular, 5-ribbed, 5-toothed; corolla salverform or funnellform, its tube straight or curved, the limb spreading, 5-lobed, regular or slightly 2-lipped; stamens 4, didynamous, included; ovary entire or somewhat 4-lobed apically, 4-loculed, each locule with 1 ovule; fruit dry, enclosed in the calyx, separating into 4 nutlets at maturity.

- 1. Spikes mostly broad and dense; flowers showy; corolla tube 8 mm long or more; calyx 7-13 mm long 2
- Spikes mostly slender and elongate following anthesis; flowers not especially showy; corolla tube 6 mm long or less; calyx 2.5-5 mm long 3
- 2(1). Corolla tube only slightly longer than the calyx; herbage conspicuously villous; corolla limb 8-9 mm wide *V. gooddingii*
- Corolla tube 1.3-5 times longer than the calyx; herbage densely hispid-hirsute; corolla limb 8-10 mm wide *V. bipinnatifida*
- 3(1). Plants branching at the base, the branches decumbent or ascending; bracts conspicuous, at least twice as long as the calyx *V. bracteata*
- Plants rarely branching at the base; stems erect or nearly so; bracts inconspicuous, less than 1.5 times longer than the calyx 4
- 4(3). Leaf blades thin, not reticulate, often hastately lobed at base; fruiting spikes narrow, less than 7 mm wide *V. hastata*
- Leaf blades thick, rugose-reticulate, not hastate basally; fruiting spikes thick, over 7 mm wide *V. macdougalii*

Verbena bipinnatifida Nutt. Dakota Vervain. [*Glaudularia bipinnatifida* (Nutt.) Nutt.]. Stems diffusely branched from the base, ascending, rooting at the nodes,

hispid-hirsute; leaves bi- or tripinnately parted, with the divisions again bipinnatifid, 2–6 cm long, the lobes linear or oblong, appressed hirsute on both surfaces; spikes compact at anthesis, elongating in fruit; bractlets usually longer than the calyx, linear-subulate, hirsute-hispid, ciliate; calyx 8.5–10 mm long, the lobes subulate, hispid ciliate; corolla pink to lavender, the limb 8–10 mm wide, the lobes emarginate; $n = 5$. Dry roadsides, pastures and vacant lots below 1600 m in Utah and Washington counties; South Dakota to Missouri and eastward, south to Arizona and Mexico; 2 (i). This species is known from both cultivated and established material. It apparently is assignable to var. *latiloba* Perry.

Verbena bracteata Lag. & Rodr. Prostrate Vervain. [*V. bracteosa* Michx.]. Annual to perennial herbs; stems diffusely branched, decumbent or ascending, 1–5 dm long, more or less hirsute; leaves oblong to cuneate-obovate in outline, 1–4 cm long, pinnately 3-parted or -lobed, the middle lobe the largest and incisely toothed or cleft, more or less hirsute on both surfaces; spikes sessile; bracts conspicuous, much longer than the calyx; calyx 3–4 mm long; corolla pale blue to purple, the tube 3–5 mm long, the limb 2.5–3 mm wide. Roadsides, fields, and other disturbed sites at 930 to 2660 m in nearly all Utah counties; widely distributed in North America; Mexico; 94 (viii).

Verbena gooddingii Briq. Goodding Vervain. [*Glandularia gooddingii* (Briq.) Solbrig]. Perennial herbs; stems several, ascending, 2–4.5 dm tall, more or less villous-hirsute and glandular; leaves rounded in outline, 1–2 cm long, palmately 3-parted, then pinnately cleft, with petioles 5–15 mm long, villous-hirsute on both surfaces; spikes capitate, somewhat elongating in fruit; bracts lance-linear, ca 8 mm long; calyx 7–10 mm long; corolla purplish to rose, the tube 8–12 mm long, the limb 8–10 mm wide, with retuse lobes; $n = 15$. Blackbrush, pinyon-juniper, and ponderosa pine communities at 1100 to 2030 m in Washington County; Texas to California and Mexico; 11 (iii).

Verbena hastata L. Blue Vervain. Erect perennial herbs; stems 4–15 dm tall, branched above only, strigose-hispidulous; leaves lanceolate to ovate-lanceolate, 5–15 cm long, the lower sometimes hastate, acute, serrate or incised-dentate, shortly petiolate, rough pubescent on both surfaces; spikes straight, usually numerous in an upright panicle, not over 7 mm wide; bracts shorter than the calyx; calyx 2.5–3 mm long; corolla blue to purplish or pink, the tube ca 3 mm long, the limb 2.5–4 mm wide. Wet meadows, marshes, and bogs in palustrine and riparian habitats at 1300 to 2000 m in Box Elder, Cache, Davis, Salt Lake, Tooele, Utah, and Weber Counties; widely distributed in the U. S. and southern Canada; 18 (ii).

Verbena macdougalii Heller New Mexico Vervain. Perennial herbs; stems 3–10 dm tall, erect, stout, simple or sparingly branched above, ash green, hirsute; leaves oblong-elliptic to ovate-lanceolate, 6–10 cm long, shortly petiolate, coarsely and irregularly serrate-dentate, hirtellous, rugose above, prominently veined below; spikes solitary or few, thick, over 7 mm wide; bracts ca 1–2 mm longer than the calyx; calyx 4–5 mm long; corolla blue to purple, the tube 4–5 mm long, scarcely exceeding the calyx, the limb 6 mm wide. Ponderosa pine forest at ca 2160 to 2600 m in Garfield County; Wyoming and Colorado to New Mexico and Arizona; 1 (0).

VIOLACEAE Batsch

Violet Family

Annual or perennial herbs; leaves basal or cauline and alternate, simple or pedatifid; flowers perfect, irregular, or sometimes cleistogamous, solitary; sepals 5, distinct or nearly so; petals 5, the lowermost spurred; stamens 5; pistils 1, the ovary superior, 1-loculed, 3- to 5-carpelled; style 1; stigma usually lobed; fruit a loculicidal capsule; $x = 6-13, 17, 21, 23$.

Baker, M. S. 1935. Studies in western violets -I. Madrono 3: 51-56.
 ———. 1940. Studies in western violets -III. Madrono 5: 215-231.
 ———. 1949. Studies in western violets -IV. Leaflet W. Bot. 5: 141-156.

Viola L.

Plants with caudices, rhizomes, or stolons, acaulescent or caulescent; leaves with stipules and petioles, the blades pedate or not; flowers on axillary peduncles, the early ones open-flowered, the later ones often cleistogamous; sepals persistent; petals purple, pink, violet, white, or varicolored; stamens with short filaments, the connective extended beyond the anther apex as a broad membranous appendage; capsule explosively dehiscent.

- 1. Leaf blade pedately compound, the main segments again deeply divided into slender segments; plants rare along the Wasatch Front *V. beckwithii*
- Leaf blades entire or merely toothed, not as above; plants common or uncommon 2
- 2(1). Stipules foliaceous, toothed or pinnatifid basally 3
- Stipules not foliaceous, entire or merely toothed 4
- 3(2). Plants annual; flowers small, not especially showy
- Plants annual or perennial; flowers large and showy
- *V. arvensis*
- *V. tricolor*
- 4(2). Petals yellow, sometimes suffused with purple dorsally 5
- Petals blue, purple, or white 6
- 5(4). Leaf blades commonly toothed or lobed (rarely entire), about as broad as long, usually purplish veined
- *V. purpurea*
- Leaf blades entire or remotely toothed, much longer than broad, not purplish veined
- *V. nuttallii*
- 6(4). Plants caulescent, at least 1 internode apparent on flowering stems, the peduncles visibly axillary 7
- Plants acaulescent or at most stoloniferous; peduncles arising from a basal tuft of leaves 8
- 7(6). Petals white or suffused with pale lavender; spur short; stems usually with 2 or more apparent internodes
- *V. canadensis*
- Petals violet, spur elongate; stems mainly with 1 or 2 apparent internodes
- *V. adunca*
- 8(6). Plants stoloniferous 9
- Plants acaulescent 10
- 9(8). Flowers white to pale violet; plants uncommon in moist sites, usually in higher elevations, indigenous
- *V. palustris*
- Flowers deep violet purple, fragrant; plants cultivated and persisting
- *V. odorata*
- 10(8). Leaf blades acute apically, as long as broad or longer; plants cultivated and persisting
- *V. papilionacea*

- Leaf blades rounded apically, usually broader than long; plants indigenous *V. nephrophylla*

Viola adunca J. E. Sm. ex Rees Blue Violet. [*V. mamillata* Greene, type from Uintah County; *V. oxysepala* Greene, type from Sanpete County; *V. tidesstromii* Greene, type from Sanpete County]. Plants with short to elongate rhizomes and more or less developed caudex, usually stemless early in the season, stemmed as the season advances, often with 1–3 apparent internodes; stipules 3–12 (15) mm long, entire or toothed; petioles 1–12 cm long, glabrous or hairy; leaf blades cordate to ovate or reniform, crenate, 0.4–4.5 cm wide, 0.6–6 cm long, hairy or glabrous, the apex bluntly acute to rounded; peduncles 0.6–5 cm long, with 2 bracts borne usually at or above the middle; flowers 7–15 (21) mm long, the spur to half as long as the lowest petal (or longer); petals blue to violet or white, the lateral pair bearded; style bearded; $2n = 20, 30, 40$. Mountain brush, aspen, ponderosa pine, lodgepole pine, spruce-fir, meadow, and alpine tundra communities at 1525 to 3450 m, known in all Utah counties, except Davis, Iron, Rich, and Washington; Alaska and Yukon, east to Newfoundland, south to California, New Mexico, and the Great Lakes; 151 (xxv). A dwarf, high elevation phase of this species from the Wasatch and Uinta mts. has been identified as var. *bellidifolia* (Greene) Harrington [*V. bellidifolia* Greene; *V. bellidifolia* ssp. *valida* Baker, type from Brighton], but it is transitional in all features with the common phase of the species that adjoins it.

Viola arvensis Murray Field Pansy. Plants annual, the stems simple or branched, mainly 1–3 dm tall, with reflexed hairs on the angles; petioles 0.5–2 cm long (or lacking); leaf blades variable, the lower ones ovate to orbicular, the upper ones oblong to narrowly elliptic, crenate, blunt or acutish apically; peduncles 2–8 cm long; flowers white to yellow or blue, or with the tips purplish, 10–15 mm long, 0.7–10 mm wide; sepals as long as the petals or longer, lanceolate; style head hairy; $2n = 34$. Weedy species, widely grown in gardens, escaping and persisting in Cache County (Maguire sn 1932 BRY); sporadic in the U. S.; adventive from Europe; 1 (0).

Viola beckwithii T. & G. Beckwith Violet. [*V. beckwithii* var. *cachensis* C. P. Sm., type from Cache County?; *V. bonnevillensis* Cottam, type from Salt Lake City]. Plants arising from subterranean, vertical, root crowns, the leaves and stems pale and thin below ground level, above ground portion mainly 5–12 cm tall; herbage puberulent (especially the leaves); stipules membranous, 0.8–3 cm long above ground, adnate to the petiole; petioles 2–15 cm long; leaf blades ternately 2–3 times compound, the ultimate segments linear to narrowly oblong; peduncles shorter than to longer than the leaves; flowers 12–18 mm long; sepals obtuse to rounded, rarely acute; upper paired petals red purple, the lower ones violet, the lateral pair bearded; style head hairy. Foothills, in bluebunch wheatgrass and mountain brush communities, at ca 1370 to 1680 m in Box Elder, Cache, Salt Lake, and Utah counties; Oregon to Idaho, Nevada, and California; 6 (0). The name *V. bonnevillensis* Cottam, is based on plants more or less intermediate with *V. purpurea*. Possibly, the type of the species came from Utah (between Great Salt Lake and the Sierra Nevada). This handsome violet has been displaced largely from its range in Utah by housing subdivisions and commercial developments. It has not been collected in Utah County, to my knowledge, since 1933.

Viola canadensis L. Canada Violet. [*V. rugulosa* Greene; *V. canadensis* var. *rugulosa* (Greene) C. L. Hitchc.]. Plants with short to elongate rhizomes and sometimes with stolons (seldom collected) as well; aerial stems 5–40 cm tall, usually with 1–4 elongate internodes; stipules 8–20 mm long, entire; petioles 2–25 cm long, glabrous or puberulent; leaf blades cordate, acute to acuminate, puberulent to glabrous, 3–10 cm long, 2–10 cm broad; peduncles 1–4 cm long, arising from upper axils, the bracts from below to above the middle; flowers 10–15 mm long, the spur short; petals white, yellow at the base, the lower ones with purple lines, the lateral pair bearded, purplish dorsally; style bearded. Mountain brush, ponderosa pine, sagebrush, aspen, and spruce-fir communities at 1830 to 3085 m in Beaver, Carbon, Emery, Garfield, Grand, Iron, Kane, Piute, Rich, Salt Lake, San Juan, Sanpete, Sevier, Utah, and Washington counties; British Columbia east to the Atlantic, south to Oregon, Arizona, and New Mexico; 51 (xi). Segregation of varieties from among our specimens seems unwarranted.

Viola nephrophylla Greene Bog Violet. [*V. clauseniana* Baker, type from Zion Canyon]. Plants 0.4–2 dm tall, with thickened, elongate rhizomes, the leaves arising from vertical rhizome apices; stipules 5–12 mm long, entire; petioles 3–25 cm long, glabrous; leaf blades ovate to cordate or reniform, rounded to obtusely cuspidate apically, crenate-dentate, 2–7 cm wide, 2–7 cm long from sinus to apex, glabrous to minutely puberulent along the veins of the upper surface; peduncles 2–25 cm long, mostly surpassing the leaves, with bracts from below to above the middle; flowers 10–22 mm long, the spur 2–5 mm long; petals bluish violet, the lower 3 whitish basally and bearded, the upper pair beardless or bearded; style glabrous. Blackbrush communities upward to alpine forests at 1155 to 3175 m in all Utah counties, except Rich, Sanpete, and Summit; British Columbia to Newfoundland, south to California, Arizona, New Mexico, and Wisconsin; 55 (v).

Viola nuttallii Pursh Nuttall Violet [*V. praemorsa* Dougl.; *V. lingaeifolia* Nutt. in T. & G.]. Plants acaulescent or short caulescent, typically 5–25 cm tall, with thickened mostly vertical rhizomes; herbage glabrous to densely hairy; stipules 5–20 mm long, entire or toothed; petioles 0.5–15 cm long; leaf blades ovate to elliptic, lanceolate, or oblong, rounded to obtuse apically, irregularly toothed to subentire, mostly 1–7 cm long, 0.5–4 cm wide, cuneate to truncate or subcordate basally; peduncles shorter than or longer than the leaves; flowers 8–17 mm long; petals yellow, the upper ones often brownish or purplish dorsally, the lower 3 lined purple, the lateral pair bearded; style head bearded. Sagebrush, mountain brush, aspen, and mixed conifer communities at 1370 to 3205 m in Beaver, Box Elder, Cache, Carbon, Daggett, Davis, Duchesne, Emery, Juab, Millard, Morgan, Salt Lake, Sanpete, Sevier, Summit, Uintah, Utah, and Weber counties; British Columbia to Saskatchewan, south to California, Arizona, Colorado, and Kansas; 119 (x). The Nuttall violet is known to form intermediates with *V. purpurea* (q.v.), but most specimens can be segregated easily. Our materials have been treated as belonging to two varieties, based mainly on leaf shape; var. *vallicola* (A. Nels.) St. John [*V. vallicola* A. Nels.], with usually truncate to subcordate leaf bases, and var. *major* Hook., with cuneate leaf bases. Only arbitrary separation seems possible.

Viola odorata L. Sweet Violet; English Violet. Plants mostly 4–12 cm tall, from slender, creeping rhizomes and elongate strawberrylike stolons; herbage sparingly puberulent throughout, except retrorsely hairy on peduncles; stipules mostly 5–12 mm long, entire or serrate; petioles 2–9 cm long, arising from the summit of an erect, thickened rhizome; leaf blades 1.3–6 cm long from sinus to apex, 1.5–8 cm wide, cordate to subreniform, crenate, obtuse to rounded apically; peduncles mostly 4–12 cm long, the bracts near the middle; flowers 12–22 mm long, fragrant; petals typically deep violet, varying to paler shades or white, the lateral petals bearded; spur 2.5–4 mm long; style head glabrous; $2n = 20$. Lawns, gardens, irrigation canal banks, and other moist sites, usually near habitations, at ca 1340 to 1710 m in Salt Lake and Utah counties; naturalized in many places in the U. S.; introduced from Europe; 5 (0). This is a commonly grown vigorous ornamental that spreads and persists.

Viola palustris L. Marsh Violet. Plants 3–19 cm tall, from slender elongate rhizomes and creeping stolons; herbage glabrous; stipules 5–11 mm long, entire; petioles 0.7–13 cm long; leaf blades 0.5–3.5 cm long from sinus to apex, 0.5–4 cm wide, peduncles 2–15 cm long, often surpassing the leaves, the bracts from below to above the middle; flowers 9–16 mm long, the spur 2–3 mm long; petals lavender to almost white, the lower petals with purple lines, the lateral pair sparsely bearded to glabrous; style glabrous; $2n = 48$. Stream banks, wet meadows, and talus slopes, in willow, aspen, spruce, and alpine tundra communities, at 2375 to 3355 m in Box Elder, Duchesne, Garfield, Piute, Salt Lake, Sevier, Summit, and Wayne counties; Alaska east to Labrador, south to California and Colorado; circumboreal; 15 (i).

Viola papilionacea Pursh Meadow Violet. Plants mainly 6–30 cm tall, from thick horizontal and vertical rhizomes; herbage sparingly puberulent to spreading long-hairy or glabrous; stipules mainly 10–30 mm long, entire or with long gland-tipped teeth; petioles 3–24 cm long; leaf blades 1.2–10 cm long from sinus to apex, 1.5–13 cm wide, cordate to orbicular, crenate-serrate, rounded-acute apically; peduncles mostly 5–12 cm long, the bracts often well below the middle; flowers mostly 18–25 mm long, the spur 1–3 mm long; petals white to pink, violet, or lavender, with blue purple lines, the lateral petals bearded; style head glabrous. Cultivated ornamentals, spreading and long persisting in Utah County; widely distributed in the eastern U. S.; 3 (0).

Viola purpurea Kellogg Pine Violet. [*V. utahensis* Baker & Clausen, type from Providence Canyon]. Plants mainly 4–15 cm tall, from a thick subrhizomatous caudex; herbage scaberrulous to subglabrous; stipules mostly 4–10 mm long, entire or toothed; petioles 1–12 cm long; leaf blades 0.6–4 cm long and about as broad or broader, ovate, oval, or orbicular, mostly obtuse to acute (rarely subcordate) basally, crenate to entire or shortly lobed; peduncles 1–9 cm long, the bracts often below the middle; flowers mostly 5–12 mm long; petals yellow, purple veined and commonly purple dorsally, the lateral ones bearded or glabrous; spurs 1–2 mm long; style head bearded. Sagebrush, mountain brush, pinyon-juniper, aspen, and spruce-fir communities at 1525 to 3175 m in Beaver, Box Elder, Cache, Davis, Duchesne, Juab, Kane, Millard, Morgan, Piute, Salt Lake, Sanpete, Sevier, Summit, Tooele, Utah, Wasatch, Washington, and Weber counties; Washington to Montana, south to

California, Arizona, and Colorado; 77 (v). The bulk of our material belongs to var. *venosa* (Wats.) Brainerd [*V. nuttallii* var. *venosa* Wats.], but material with entire leaves from Washington County is referable to var. *charlestonensis* (Baker & Clausen) Welsh & Reveal [*V. charlestonensis* Baker & Clausen]. The pine violet forms an intergrading series with *V. nuttallii*, a portion of that variation forms the basis for recognition of *V. utahensis*, but most specimens can be assigned readily to one or the other of the species.

Viola tricolor L. Pansy. Plants caulescent, mainly 10–45 cm long, annual (or short-lived perennial) from taproots; herbage glabrous or pubescent; petioles short or lacking; stipules foliose and pinnately lobed; leaf blades 1–8 cm long, 1–2.5 cm wide, orbicular to lanceolate or elliptic, crenate; peduncles 2–12 cm long; flowers 1–6 cm wide; petals variously colored, marked with yellow, purple, bronze, or white, the upper ones usually darker, the lateral pair bearded; $2n = 26, 28, 42, 46$. Cultivated ornamentals, escaping, and occasionally persisting in Salt Lake, Uintah, and Utah counties; widely grown elsewhere; native to the Old World; 7 (0). The large flowered phase has been derived through hybridization and is known as *V. x. wittrockiana* Gams.

VISCACEAE Miers

Mistletoe Family

Plants parasitic on branches of trees and shrubs; stems brittle (especially when dry), with swollen jointed nodes, often freely branched; leaves opposite, simple, entire (often scale-like), leathery and persistent; flowers imperfect, inconspicuous, apetalous, in axillary spikes or cymes or clustered at the nodes (sometimes solitary); perianth calyxlike with 2–5 sepals, persistent; staminate flowers with 2–5 stamens inserted on the lower portion of the sepals, the anthers mostly 1- to 2-loculed; pistillate flowers with a more reduced perianth; ovary inferior, 1-loculed; style 1; fruit a berry, fleshy, 1 (2–3)-seeded; $x = 10–15$.

Hawksworth, F. G. and D. Wiens. 1972. Biology and classification of dwarf mistletoes (*Arceuthobium*). U.S.D.A., Forest Service, Agriculture Handbook No. 401 234 pp.

1. Perianth of the pistillate flower 2-lobed; fruits compressed, on recurved pedicels; anthers 1-loculed; parasitic on conifers except junipers *Arceuthobium*
- Perianth of the pistillate flower 3-lobed; fruits globose to subglobose, sessile; anthers 2-loculed; parasitic on junipers and deciduous trees and shrubs *Phoradendron*

Arceuthobium Bieb.

Parasitic on conifers; stems yellowish to greenish, often strongly divaricate or erect, glabrous, jointed, terete to angled with short, swollen internodes; leaves reduced, scalelike, opposite; flowers axillary, 2 to several per node or terminal, dioecious; staminate flowers mostly 3- or 4-merous, the segments somewhat fleshy and each lobe with an adnate anther; pistillate flowers with 2 perianth lobes adnate to the ovary; stigma 1, entire to slightly lobed; style lacking. Note: The taxonomy in this treatment follows that of Hawksworth and Wiens (1972).

1. Branches, flowers, and fruit in whorls; internodes ca 10 times longer than wide; parasitic mostly on *Pinus contorta* (occasional on *P. ponderosa*) *A. americanum*
- Branches flabellate but not whorled; flowers in decussate pairs, never whorled; parasitic on various conifers 2
- 2(1). Shoots olive green to brownish; parasitic on *Pinus edulis* and *P. monophylla* *A. divaricatum*
- Shoots variously colored; parasitic on other hosts 3
- 3(2). Shoots orange to reddish brown, not bright; plants mostly parasitic on ponderosa pine and Engelmann spruce (occasional on bristle cone pine and limber pine) *A. vaginatum*
- Shoots yellow to yellow green or olive green, not orange to reddish brown; principal host *Abies*, *Pseudotsuga*, *Pinus longaeva*, and *P. flexilis* 4
- 4(3). Shoots olive green; pistillate plants less than 4 cm tall; plants parasitic mostly on *Pseudotsuga* (occasional on *Abies concolor*) *A. douglasii*
- Shoots yellow green to yellow; pistillate plants over 4 cm tall; plants parasitic mostly on *Abies concolor*, *Pinus flexilis*, and *P. longaeva* 5
- 5(4). Plants 10 cm high or more (up to 2.2 dm), mostly yellowish or yellowish green; parasitic on *Abies concolor* *A. abietinum*
- Plants 3–5 dm tall, yellow green; parasitic on pines, *P. flexilis* and *P. longaeva* ours *A. cyanocarpum*

Arceuthobium abietinum Engelm. ex Munz Fir Dwarf-mistletoe. [*A. douglasii* var. *abietinum* Engelm. in Wats., *A. occidentale* var. *abietinum* Engelm. in Wats., *Razoumofskyia douglasii* var. *abietinum* (Engelm.) Howell, *R. abietina* (Engelm.) Abrams, *A. campylopodium* f. *abietinum* (Engelm.) Gill]. Plants 8–22 cm high with yellowish or yellowish green shoots; main stems 1.5–2 (6) mm wide basally; staminate flowers ca 2.5 mm in diameter; perianth 3 (4) –merous, acute apically, yellowish to yellow green, lobes 1.2 mm long, 1 mm wide; mature fruit ca 4 mm long, 2 mm wide. Growing on *Abies concolor* in Kane County; Washington to California, Nevada, and Arizona; 1 (0). Our plants belong to f. sp. *concoloris* Hawksworth & Wiens. This mistletoe is known to parasitize *Abies lasiocarpa* in northern Arizona where that species grows with *A. concolor* but occurrence on subalpine fir is not presently known in Utah.

Arceuthobium americanum Nutt. ex Engelm. in Gray Lodgepole Pine Dwarf-mistletoe. [*Razoumofskyia americana* (Nutt. ex Engelm.) Kuntze]. Stems yellowish to olive green 2–9 (30) cm long, the branches whorled; staminate flowers on short lateral stems, 2 to several per node; flowers 2 mm long; perianth mostly 3–merous (sometimes 4), the lobes 1.1 mm long; pistillate flowers 2 to several, 2–merous, whorled at the nodes, short-pedicellate; mature fruit 3.5–4 mm long, maturing the second summer. Lodgepole pine and other pine and spruce species in Cache, Daggett, Duchesne, San Juan, Summit, Uintah, and Wasatch counties; Canada, southern California and central Colorado; 6 (0).

Arceuthobium cyanocarpum Coult. & Nels. Limber Pine Dwarf-mistletoe. [*Razoumofskyia cyanocarpum* Nels., *A. campylopodium* Engelm. f. *cyanocarpum* (Nels.) Gill]. Plants with yellow green shoots, 3–5 cm long, in dense, flabellate branched clusters; staminate flowers 3 mm in diameter; perianth 3–merous with acute

apex; mature fruit 3–5 mm long. Parasitic mostly on *Pinus flexilis* and *P. longaeva* in Beaver, Box Elder, Cache, Daggett, Duchesne, Garfield, Iron, Kane, San Juan, Tooele, and Wasatch counties; Montana, Colorado, southwest to California; 12 (0). This species is on ponderosa and lodgepole pines also.

Arceuthobium divaricatum Engelm. Pinyon Dwarf-mistletoe. [*Razoumofskyia divaricatum* Cov., *A. campylopodium* f. *divaricatum* (Engelm.) Gill]. Shoots olive green to brown, 5–13 cm long, the branches flabellately arranged; staminate flowers 2.5 mm long; perianth 3–merous, the lobes 1.1 mm long; mature fruit 3.5 mm long. Apparently parasitic only on pinyon pines in Beaver, Carbon, Duchesne, Emery, Garfield, Grand, Iron, Juab, Kane, Millard, Piute, San Juan, Sanpete, Uintah, and Washington counties; California, Baja California; southwestern Colorado, Arizona, New Mexico, and west Texas; 14 (0).

Arceuthobium douglasii Engelm. Douglas Fir Dwarf-mistletoe. [*Razoumofskyia douglasii* (Engelm.) Kuntze]. Stems short, 1–7 cm long, olive green, flabellately arranged; staminate flowers 2 mm long, borne in axillary flowers; perianth mostly 3 (4) –merous, the lobes rounded apically and with a reddish to purple inner surface, ca 1 mm long; pistillate flowers also in axillary pairs, 1.5 mm long; mature fruits olive green, 3–4 mm long, maturing the second season. On Douglas fir in Beaver, Cache, Daggett, Duchesne, Garfield, Grand, Iron, Kane, Millard, Piute, Salt Lake, San Juan, Sanpete, Sevier, Summit, Tooele, and Utah counties; British Columbia south to California, Idaho, Montana, Wyoming, Nevada, Colorado, Arizona, New Mexico, and Mexico; 19 (0). The species is occasional on *Abies concolor*, *A. lasiocarpa*, *Picea pungens*, and *P. engelmannii*, when these species are associated with Douglas-fir.

Arceuthobium vaginatum (Willd.) Presl in Bercht. Southwestern Dwarf-mistletoe. [*A. vaginatum* f. *cryptopodium* (Engelm.) Gill]. Shoots orange to reddish brown, flabellately arranged, the main shoots 2 (4–8) 10 mm wide at base; staminate flowers light green to yellowish, 2.5–3 mm long, axillary; perianth lobes ca 1.3 mm long; pistillate flowers axillary, the lateral ones in pairs; fruit 4.5–5.5 mm long. On ponderosa pine and Engelmann spruce in Garfield, Kane, San Juan, Sanpete, Sevier, and Wayne counties; Colorado, south to New Mexico, Arizona, west Texas and Mexico; 7(i). The species is occasionally found on lodgepole, bristlecone, and limber pines. Our plants belong to ssp. *cryptopodium* (Engelm.) Hawksworth & Wiens. [*A. cryptopodium* Engelm.].

Phoradendron Nutt.

Parasitic, dioecious; sometimes woody plants with brittle, branched, usually jointed stems; leaves scalelike, opposite, entire; flowers in short jointed spikes, sessile and sunk in the jointed rachis; perianth 1– to 4–merous (usually 3–merous), the lobes triangular, rounded; staminate flowers usually in clusters, with an adnate 2–loculed anther at the base of each perianth lobe; pistillate flowers with the perianth adnate to the ovary; ovary inferior, 1–loculed; fruit a sessile drupe, ovoid to globose. The plants are parasitic on some conifers and various woody deciduous plants.

- 1. Scalelike leaves strongly connate; pistillate inflorescence with 1 segment and 2 flowers; stems crowded, with stout branches, the internodes 5–16 mm long, mostly parasitic on juniper species *P. juniperinum*
- Scalelike leaves slightly connate; pistillate inflorescence with 2 or more segments, some segments with more than 2 flowers; stems not crowded, the branches slender and flexuous, with internodes usually 1.3–2.8 cm long, mostly parasitic on *Acacia greggii* *P. californicum*

***Phorodendron californicum* Nutt.** Acacia Mistletoe. Stems slender, terete, the branches long and slender, clustered, 1–5 cm long, with the internodes 13–28 mm long, commonly reddish; leaves scalelike, ca 1 mm long, entire; flowers in axillary spikes; staminate spikes 2– to 6–jointed; pistillate spikes 2– to 7– jointed; fruit white to red, globose, 3–4 mm in diameter. Parasitic on *Acacia greggii*, and much less commonly on *Lawrea tridentata*, in Beaver Dam Wash, Washington County; Nevada, Arizona, California, and Mexico; 12 (i). One collection from Beaver Dam Wash is reported as growing on Fremont cottonwood.

***Phorodendron juniperinum* Gray** Juniper Mistletoe. Stems usually stout, swollen at the nodes, the internodes short 5–16 mm long, glabrous; leaves scalelike, spreading, 1–2 mm long, united at base, triangular; green to yellowish green (sometimes turning dark when pressed); staminate spike with 1–2 segments, each with 5–9 flowers; sepals (2) 3 (4), triangular, free; stamen attached to base of each sepal, anther 2–loculed; pistillate spike with 1 segment and 2 flowers; ovary inferior, 1–loculed, the style 1, the sepals fused to the ovary; fruit a drupe, 1-seeded, on a recurved pedicels. Mostly parasitic on Utah juniper in Beaver, Davis, Emery, Garfield, Grand, Iron, Kane, Piute, Salt Lake, San Juan, Sanpete, Tooele, Utah, Washington, and Wayne counties; Oregon, south to California, Nevada, Colorado, New Mexico, Arizona, west Texas, and Mexico; 34(ii). Our plants belong to *ssp. juniperinum*. Curiously the species is apparently lacking in the Uinta Basin, a principal locality for the host plant.

VITACEAE A. L. Juss.

Grape Family

Shrubs or woody vines, usually supported by tendrils opposite the leaves or on peduncles, sympodial; leaves alternate usually palmately 3– to 5–lobed or compound; stipules deciduous; inflorescence terminal, appearing opposite the leaves; flowers often imperfect and perfect on the same plant, small, regular, greenish; sepals 4 or 5, minute; petals 4 or 5; stamens as many as the petals and opposite them; style short or none; pistil 1, the ovary 2–loculed, 1– to 4–ovuled; fruit a berry (grape); x = 11–20.

- 1. Leaves merely palmately veined and lobed; plants indigenous in Washington County, widely cultivated there and elsewhere *Vitis*
- Leaves palmately compound, plants indigenous in southeastern Utah, and cultivated elsewhere *Parthenocissus*

***Parthenocissus* Planchon**

Woody vines, supported by tendrils that clasp or affix themselves by adhesive disks; leaves palmately compound; leaflets 3–7, coarsely serrate; inflorescence cy-

mose; flowers perfect or imperfect; calyx minutely 5–toothed; petals distinct; disk lacking; berries thinly fleshy.

- 1. Tendrils with 3–8 branches, these terminating in adhesive disks; inflorescence with the axis usually well developed; plants cultivated, rarely escaping *P. quinquefolia*
- Tendrils with 3–5 branches, these lacking adhesive disks; inflorescence dichotomously branched; plants indigenous in southeastern Utah, seldom cultivated *P. vitacea*

***Parthenocissus quinquefolia* (L.) Planchon** Virginia Creeper. [*Hedera quinquefolia* L.]. Vines to 5 m tall or more, supported by tendrils with 3–8 branches, these terminated by adhesive disks; leaflets with distinct petiolules, 3–15 cm long, 1.6–8 cm wide, oblanceolate to obovate, lanceolate or ovate, coarsely serrate, pale green and dull above, glaucous beneath; cymes usually with a definite central axis with flowers clusters arising laterally from that axis; berries 5–7 mm thick. Cultivated ornamental in much of Utah, escaping and established in Daggett, Salt Lake, Uintah, and Utah counties; introduced from eastern U. S.; 4 (0). The brightly colored leaves in autumn are beautiful.

***Parthenocissus vitacea* (Knerr) A. S. Hitchc.** Thicket Creeper. [*Ampelopsis quinquefolia* var. *vitacea* Knerr; *P. inserta* (Knerr) Fritsch, misapplied]. Vines clambering or trailing, rarely weakly climbing, supported by tendrils with 3–5 branches with slender nonadhesive tips; leaflets shortly petiolulate, mainly 3–13 cm long, 1.5–6 cm wide, obovate to oblanceolate, coarsely serrate, lustrous above, green and not especially glaucous beneath; inflorescence mainly dichotomously branched, without a main central axis; berries 8–10 mm thick; 2n = 40. Hanging gardens, canyon bottoms, and near seeps and springs in Garfield, Kane, and San Juan counties; Montana to Quebec, south to Wyoming and Texas; 11 (v).

***Vitis* L.**

Clambering shrubs; leaves palmately veined and usually lobed; flowers small; calyx minute, the limb unlobed; inflorescence a compound thyrsoid cyme opposite the leaf; petals 5, usually coherent apically; disk of 5 glands alternate with the stamens; ovary 2–loculed; style short; berry usually 2– to 4–seeded.

- 1. Leaves persistently and densely tomentose on the lower surface; plants cultivated and long persisting *V. labrusca*
- Leaves thinly if at all hairy or the hairs confined to lower vein axils; plants cultivated or indigenous 2
- 2(1). Bark shreddy, hanging loose between the nodes; skin of fruit slipping free from the pulp; plants indigenous in Washington County *V. arizonica*
- Bark not especially shreddy; skin of fruit not slipping free from the pulp, plants widely grown *V. vinifera*

***Vitis arizonica* Engelm.** Canyon Grape. Sprawling or clambering woody vines, mainly 2–6 m long; herbage thinly tomentose to subglabrous; leaf blades 3–12 cm long, 4–14 cm wide, cordate to cordate-ovate or uniform; inflorescence 5–10 cm long, with slender peduncle, panicle-like; grapes 6–10 mm thick; juicy, palatable, but tending towards bitter. Canyon bottoms and talus slopes, often where moist, at ca 850 to 1350 m in Washington County; Nevada, Arizona, New Mexico, Texas, and Mexico; 13 (i).

Vitis labrusca L. Fox Grape; Concord Grape. Sprawling or clambering woody vines, mainly 2–15 m long; herbage tomentose, densely and persistently so on lower leaf surfaces; leaf blades mainly 3–15 cm long and 4–20 cm wide, cordate to uniform; inflorescence 5–12 cm long, paniculiform; grapes 6–15 mm thick, juicy, palatable, though often laden with tannins; $n = 19$. Widely grown fruit plant, long persisting following cultivation, and more or less established in Washington County (at least); introduced from the eastern U. S.; 2 (i). This is the common slip-skin grape of commerce. Fruit color varies from greenish to purplish or purplish black. Many horticultural varieties are grown.

Vitis vinifera L. Wine Grape. Sprawling or clambering woody vines, mainly 3–6 m long; herbage subglabrous or more or less hairy in lower vein axils; leaf blades mainly 4–13 cm long and 5–18 cm wide, orbicular, cordate, or oval in outline; inflorescences paniculiform, mainly 4–13 cm long and 5–18 cm wide, orbicular, cordate or oval in outline; inflorescences paniculiform, mainly 6–30 cm long (or more); grapes 6–30 mm long (or more), juicy, palatable, seeded or seedless; $2n = 38, 76$. Widely grown dessert and wine grape in Utah, persisting but not known from naturalized occurrences; introduced from Eurasia; 1 (i). The history of this grape is closely tied to Eurasian history, grapes having been grown since antiquity. Popular seedless and seeded hardy or semihardy varieties are grown in warmer portions of the state.

ZYGOPHYLLACEAE R. Br. in Flinders

Caltrop Family

Annual or perennial herbs or shrubs; leaves usually opposite, pinnately compound or digitately 2 or 3 (7)–foliolate, the leaflets entire; flowers perfect, regular or nearly so; sepals 5, distinct or united at the base; petals usually 5; stamens usually 10; pistil 1, the ovary superior, usually 4- or 5-loculed; style 1; fruit splitting into several nutlets; $x = 6, 8-13+$.

1. Flowers purple; stipules spiny; leaflets palmately 3-foliolate *Fagonia*
- Flowers yellow; stipules not spiny; leaves bifoliolate or pinnately plurifoliolate 2
- 2(1). Plants woody shrubs; leaves with 2 leathery resinous leaflets; fruit globose, villous *Larrea*
- Plants prostrate herbs; leaves pinnately compound with few to many leaflets; fruit not as above 3
- 3(2). Fruit armed with spines, splitting into 5, or fewer, 2-spined nutlets *Tribulus*
- Fruit not armed with spines, splitting into 10, merely tuberculate nutlets *Kallstroemia*

Fagonia L.

Perennial herbs, woody below; leaves opposite, usually 3-foliolate, the leaflets more or less spinose-tipped; stipules spinose; pedicels axillary, solitary, reflexed in fruit; sepals 5, caducous; petals 5, caducous; stamens 10; ovary 5-loculed, with 2 ovules per locule; fruit ovoid, deeply 5-grooved, separating into 5 ultimately dehiscent nutlets.

Fagonia laevis Standley [*F. californica* authors, not Benth.?; *F. chutensis* var. *laevis* (Standley) Johnston]. Plants clump-forming, much branched, 1–4 dm tall;

stems angled, smooth or scabrous above; stipules subulate, 1.5–4 mm long, spreading; leaves petiolate, the leaflets 3–13 mm long, 1–3 mm wide, lanceolate to oblanceolate, mucronate; pedicels 3–15 mm long; sepals 2–4 mm long; petals 5–9 mm long, purplish; fruit 3–5 mm long, reticulate, pubescent, tipped by a stylar beak 1.5–2 mm long. Creosote bush community at ca 915 m in Washington County (US); Arizona; 1 (0).

Kallstroemia Scop.

Annual herbs; stems prostrate; leaves even-pinnate; stipules membranous, deciduous; flowers solitary, axillary, 5-merous; stamens 10, the filaments slender; pistil 1, the carpels typically 5; fruit breaking into twice as many indehiscent, 1-seeded tuberculate, not spiny nutlets and leaving a more or less persistent axis.

Kallstroemia californica (Wats.) Vail [*Tribulus californica* Wats.]. Stems prostrate to decumbent, branched, mostly 1.5–8 dm long, whitish hairy; stipules ca 2 mm long; leaflets in 2–7 pairs, oblong to elliptic, mainly 3–8 mm long and 1–3 mm wide; pedicels 0.5–3 cm long in fruit; sepals 3–4 mm long, deciduous; petals 3–5 mm long, yellow; fruit strigulose, ovoid-globose, ca 3 mm long, with sharp tubercles on the back of the carpels; beak glabrous, slender, 2–3 mm long. Mixed shrub and juniper community at ca 1280 m in eastern Kane County; Arizona, California, and Mexico; 3 (ii).

Larrea Cav.

Resinous, aromatic, evergreen shrubs; leaves opposite, with 2, spreading, sessile, asymmetrical olive green leaflets; flowers solitary, yellow, showy; sepals 5, unequal, deciduous; petals 5, yellow; stamens 10, borne on a 10-lobed nectary disk; pistil 5-lobed and 5-carpelled; style slender; stigmas 5; fruit globose, hairy, separating into 5 indehiscent, 1-seeded carpels.

Larrea tridentata (DC.) Cov. Creosote bush. [*Zygophyllum tridentatum* DC.; *L. glutinosa* Engelm.; *L. divaricata* authors, not Cav.]. Shrubs, mainly 1–3 m tall; stems flexuous, arranged in broadly rounded clumps; nodes with dark bands; stipules brown, persistent; leaflets 3–10 mm long, obliquely lance-ovate; pedicels 4–10 mm long; sepals 5–8 mm long, broadly elliptic, villous-strigose; petals yellow, 5–12 mm long; fruit 4–5.5 mm long, villous with long, white to tawny hairs; style persistent 5–9 mm long; $2n = 26, 52?$ Creosote bush and other warm desert shrub communities at 670 to 1130 m in Washington County; California, Nevada, Arizona, Texas, and Mexico; 34 (i). There are reports of the species from Iron County, but I have not seen specimens from there. The name *L. divaricata* Cav. has been applied to our material, but that name properly lies with South American plants, which are considered currently as distinct from the North American taxon. This species is a principal component of the Mohavean warm desert vegetative zone. The leaves have been used medicinally under the name “chaparral tea.”

Tribulus L.

Annual, prostrate herbs; leaves even-pinnate with several to many leaflets; stipules membranous; flowers axillary, solitary usually 5-merous; stamens usually 10, with slender filaments; petals 5, bright yellow; sepals 5, caducous; ovary 5-lobed, 5-loculed; fruit 5-angled, horizon-

tally compressed, pubescent, separating into 5, indurate, 3- to 5-seeded, indehiscent, 7-spined, nutlets.

Tribulus terrestris L. Puncture vine; Goat-head; Caltrop. Plants with prostrate spreading stems mainly 1-10 cm long; leaflets 3-8 pairs, 5-14 mm, oblong to elliptic, acute apically, pilose; petals 3-5 mm long, yellow; obovate; fruit segments crested, sculptured into elongate spinose protruberances, these spinulose-aristate, and bearing 2 puberulent spines mainly 3-6 mm long; 2n = 12, 24, 36, 48. Gardens, roadsides, sidewalks, and other open sites at 850 to 2135 m in Cache, Davis, Duchesne, Emery, Garfield, Grand, Kane, Millard, Salt Lake, San Juan, Uintah, Washington, and Weber counties; widespread in the U. S.; adventive from the Old World; 2S (ii). This tribulation of the earth is a vicious weed, leaving in its wake a refuse heap of punctured tires and painfully injured feet. This tribulation of the earth is adequately named scientifically.

CLASS LILIOPSIDA

The Monocots

Annual, winter-annual, or perennial herbs, or shrubs or trees; leaves alternate, spiral, or whorled, typically simple and parallel-veined; flower parts 3-merous; embryo with 1 cotyledon.

Key to the Families.

- 1. Plants woody or with leaves and/or stems persisting above ground throughout the year 2
- Plants not woody or the leaves and/or stems dying each year or persisting below ground only 3
- 2(1). Leaves sword-shaped or curved, apically spinose, laterally typically spinose or filiferous ... *Agaceae* p. 647
- Leaves with palmately lobed, plaited blades, sometimes filiferous, and the petioles toothed or pronged, but not as above *Palmae* p. 817
- 3(1). Plants small, free-floating aquatics, without true stems *Lemnaceae* p. 799
- Plants with stems and leaves, terrestrial or aquatic but not free-floating 4
- 4(3). Perianth lacking or reduced and inconspicuous, the parts often bristlelike or scalelike but not petallike in color and texture 5
- Perianth well developed, at least the inner segments petaloid in color and texture 15
- 5(4). Flowers sessile in axils of chaffy or husklike scales; leaves with sheathing bases 6
- Flowers not in axils of chaffy bracts, sessile or pedicellate; leaves with or without sheathing bases 7
- 6(5). Leaf sheaths split lengthwise on side opposite the blade; leaves 2-ranked; stems mostly hollow and terete; anthers versatile; flowers subtended by 2 bracts *Gramineae* p. 684
- Leaf sheaths not split; leaves 3-ranked; stems mostly solid and triangular in cross section; anthers basifixed; flowers subtended by 1 bract *Cyperaceae* p. 653
- 7(5). Plants floating or submerged, usually not emergent ... 8
- Plants terrestrial or in shallow water, usually leaves and flowers both emergent 12
- 8(7). Flowers in spikes or heads 9
- Flowers axillary and solitary or few in clusters 10

- 9(8). Flowers imperfect, in globose heads, the lower pistillate, the upper staminate *Sparganiaceae* p. 822
- Flowers perfect, in peduncled or axillary spikes; sepals 4 *Potamogetonaceae* p. 818
- 10(8). Leaves alternate *Ruppiaceae* p. 822
- Leaves opposite 11
- 11(10). Leaves 3-10 cm long or more; carpels 2 or more ... *Zannichelliaceae* p. 824
- Leaves mostly less than 3 cm long, carpel 1 *Najadaceae* p. 811
- 12(7). Inflorescence a dense, elongate spike 13
- Inflorescence in subglobose heads, racemes, or otherwise, but not in dense spikes 14
- 13(12). Inflorescence a double spike, staminate above and pistillate below; plants usually over 1 m tall *Typhaceae* p. 823
- Inflorescence a single spike (or spicate raceme), the sexes intermingled or the flowers perfect; plants usually less than 1 m tall *Juncaginaceae* p. 798
- 14(12). Flowers imperfect, the lower heads pistillate; perianth inconspicuous, of chaffy scales *Sparganiaceae* p. 822
- Flowers perfect, usually not in heads; perianth usually 6-parted, in 2 whorls *Juncaceae* p. 791
- 15(3). Pistils several to many, 1-loculed and 1-ovuled, maturing into a cluster or whorl of achenes *Alismaceae* p. 650
- Pistil 1 per flower, 3- to 12-loculed, maturing into a capsule or a berry 16
- 16(15). Ovary superior 17
- Ovary inferior 18
- 17(16). Sepals green, rarely reddish; petals colored; flowers in umbels *Commelinaceae* p. 652
- Sepals and petals colored alike or, if unlike, the flowers not in umbels *Liliaceae* p. 800
- 18(16). Plants aquatic, with mostly submersed, whorled leaves *Hydrocharitaceae* p. 788
- Plants terrestrial, the leaves neither submersed nor whorled 19
- 19(18). Inflorescence a scapose umbel, sometimes reduced to a single flower, subtended by more or less membranous bracts; stamens 6 *Amaryllidaceae* p. 651
- Inflorescence various but not an umbel, if subtended by a bract this not usually membranous (except in Iridaceae) 20
- 20(19). Fertile stamens 3; flowers regular, erect *Iridaceae* p. 789
- Fertile stamens 1 or 2; flowers irregular, typically nodding or bent *Orchidaceae* p. 812

AGAVACEAE Endl.

Agave Family

Plants succulent or subsucculent, xerophytic, acaulescent to arborescent, suckering, erect, simple or branched perennials; leaves basal and cauline, alternate (appearing spirally arranged), thick or thin and leathery, spine-tipped, the margins with spines or fibers, linear to ovate or oblanceolate; flowers mostly perfect or polygamous, small to large and often showy, white to cream, greenish, or yellowish orange, 3-merous, the perianth segments distinct or connate basally, similar in color and texture, fleshy; stamens 6; pistil 1, the ovary superior or inferior, 3-loculed, with usually numerous ovules; placentae axile

or parietal; style 1, thick, often short; stigma 3-lobed or capitate; fruit a dry or fleshy capsule or berry; x = 16-30+.

- 1. Ovary inferior; perianth yellow, the segments connate basally into a short tube; stamens exerted 10-12 mm *Agave*
- Ovary superior; perianth white to cream or greenish, the segments distinct or nearly so; stamens included ... 2
- 2(1). Flowers small, less than 1 cm long, dryish; leaves linear, long and flexible, without an apical spine *Nolina*
- Flowers larger, mostly 3 cm long or more, fleshy; leaves with an apical spine *Yucca*

Agave L.

Rosettiform perennials, forming offsets at the base; roots hard, fibrous; stems thick, very short, simple or branched; leaves thick, spine-tipped, the margins armed with teeth or unarmed; flowering stems tall, bracteate, scapose; inflorescence spicate, racemose, or paniculate; flowers showy; perianth tubular to shallowly funnelliform, the segments erect to curved, similar or dimorphic; stamens 6, exerted; filaments inserted on the tube or at the segment bases; ovary inferior, 3-loculed, succulent; pistil elongate; stigma 3-lobed, papillate-glandular; fruit a loculicidal capsule; n = 30.

Century, H. S. 1982. Agaves of continental North America. Univ. Arizona Press. Tucson, Arizona.

Agave utahensis Engelm. Utah Century-plant. [A. *newberryi* Engelm.; A. *scaphoidea* Greenm. & Roush, type from near St. George; A. *utahensis* var. *discreta* Jones]. Plants caespitose, the rosettes compact, pale grayish to yellowish green, 18-30 cm tall; leaves (8) 15-30 cm long, 1.5-3 cm wide, linear-lanceolate, stiff, straight or falcate, concave above, teeth brown-ringed around base, thickish, light gray, 2-4 mm long, the apical spine 20-40 mm long; inflorescence spicate, racemose, or paniculate, 1.2-4 m tall; flowers in clusters of 2-8, sessile or on short lateral branches, 25-30 mm long, urceolate, the segments 9-12 mm long, erect; stamens inserted near base of tube, 18-20 mm long, exerted from the perianth; capsule ovoid to oblong, 1-2 cm long. Dry slopes on limestone and sandstone in creosote bush, blackbrush, other warm desert shrub, and in the pinyon-juniper communities at 1000 to 1550 m in Washington County; Arizona and Nevada; 15 (v). The type was collected by Edward Palmer in 1870 near St. George. The species is very common, with thousands of individuals on the west slope of the Beaver Dam Mts. and also on the south slope of the Pine Valley Mts. In Paria Canyon, Coconino County, Arizona the species is known from within a short distance of the Utah boundary. That phase of the species is known as var. *kaibabensis* (McKelvey) Breitung [A. *kaibabensis* McKelvey]. Further exploration might demonstrate its existence in Kane County. Following the production of an inflorescence the rosette dies, and the offsets yield subsequent inflorescences, each in turn, dying.

Nolina Michx.

Perennials with a conspicuous caudex or stem; leaves numerous, linear, entire or with filamentous hairs or teeth on the margins, the apex acute but not spinelike; inflorescence a broad, racemose panicle, the main branches and pedicels subtended by scarious bracts; flow-

ers very small, perfect and imperfect, whitish to yellowish white; perianth segments 6, all alike, distinct, oblanceolate to obovate; stamens 6; ovary superior, 3-loculed, with 2 ovules per locule; style short; stigma 3-lobed; capsule splitting or not, broadly 3-winged; n = 19.

Nolina microcarpa Wats. Beargrass. Flowering stems stout, to ca 1.8 m tall, arising from a short caudex; leaves rather thick and somewhat keeled, 0.5-1 m long, 6-12 mm wide, serrulate to scabrous-denticulate, the apex fibrous-lacerate; panicle rather narrow, branched at the base, the branches to 3 dm long; bracts small; fruit thin and inflated, notched at both ends, ca 6 mm wide, on fruiting pedicels 4-6 mm long. Rocky slopes and ridges at ca 1200 m in Washington County (Cottam 5368 BRY); Arizona, New Mexico, and northern Mexico; 1 (0).

Yucca L.

Plants rosetiform from a caudex or arborescent, rhizomatous; leaves numerous, spirally arranged at stem or branch tips, elongate, thin and flaccid or thick and rigid, spine-tipped, with tough or fibrous margins; inflorescence a terminal raceme or panicle; flowers usually large and showy, numerous, perfect; perianth segments 6, thick, white to cream or greenish, oval to oblong or lanceolate; stamens 6; stigmas 3; fruit dry or fleshy, dehiscent or indehiscent; seeds flat, blackish; n = 30. Note: **Yucca filamentosa** L. (Adams-needle) is rather widely cultivated in Utah. It has somewhat flaccid leaves to 8 dm long and 2.5 cm wide. It flowers profusely in most years.

McKelvey, S. D. 1938. Yuccas of the Southwestern United States. Part I. Arnold Arboretum, Jamaica Plain, Mass. 150 pp.
 ———. 1947. Yuccas of the southwestern United States. Part II. Arnold Arboretum, Jamaica Plain, Mass. 150 pp.
 Webber, J. M. 1953. Yuccas of the Southwest. USDA Agric. Monographs 17: 1-97.
 Reveal, J. L. 1977. *Yucca*. In: Cronquist, A. et al. Intermountain Flora 1: 526-538.

- 1. Fruit indehiscent, fleshy or spongy and dry; plants treelike and with short non-filiferous leaves, or caespitose and with large, broad, swordlike leaves 2 cm or more wide 2
- Fruit dehiscent, dry; plants acaulescent or short-caulescent, with narrow, filiferous margined leaves often less than 2 cm wide 4
- 2(1). Plants treelike, usually branched; leaf blades seldom more than 2.5 dm long, minutely denticulate; fruit spongy and dry at maturity *Y. brevifolia*
- Plants treelike or not; leaf blades mostly more than 6 dm long, entire or filiferous; fruit fleshy at maturity 3
- 3(2). Plants treelike, with a well-defined stem; pistils 1.8-4 cm long; rare on the Beaver Dam Slope *Y. schudigera*
- Plants acaulescent, or with short, decumbent stems; pistils 4.5-9 cm long; common on the Beaver Dam Slope and east through southern Utah *Y. baccata*
- 4(1). Leaf blades concavo-convex, 0.6-5 dm long, lanceolate; inflorescence racemose, 3.5-7 dm long, on a short peduncle 1-4 dm long; style green, 9-13 mm long; fruit constricted *Y. harrimaniae*
- Leaf blades plano-convex, linear to acicular; style white to pale green; fruits constricted or not; peduncles and inflorescence much longer 5
- 5(4). Inflorescence paniculate; scape elongate, the first flower well above the foliage leaves; plants usually caulescent, with a short simple or branched stem to 1.3 m tall, in Washington County *Y. utahensis*

- Inflorescence racemose, or if paniculate, the distribution otherwise; peduncle short or elongate; plants acaulescent or only rarely short-caulescent 6
- 6(5). Peduncle short, less than 1 dm long, inflorescence subequal to the leaves or shorter, these together usually less than 1 m long, fruits pendulous, not constricted, plants of Garfield, Grand, Kane, and San Juan counties *Y. baileyi*
- Peduncle much longer; inflorescence elevated to well above the leaves; fruits erect or spreading 7
- 7(6). Capsules 3–4.2 cm long, deeply constricted; scape and inflorescence together reaching to 1.8 m tall; plants widespread *Y. angustissima*
- Capsules 4.5–7.5 cm long, moderately constricted; peduncle and inflorescence together mainly 2–3.5 m tall; plants rather restricted 8
- 8(7). Flowers 3–4.5 (5.2) cm long, pistil 1.5–3.2 cm long, peduncle 1.2–3.8 m tall, much surpassing the leaves; inflorescence commonly with 1–15 lateral branches; plants of Glen Canyon, Kane, Garfield, and San Juan counties *Y. toftiae*
- Flowers 5.5–6.5 cm long; pistil 3–3.5 cm long; peduncles 0.5–1 m long, usually shorter than the leaves; inflorescence simple or with 1 to few lateral branches; plants of sandy sites in Kane and Washington counties *Y. kanabensis*

Yucca angustissima Engelm. ex Trel. Narrow-leaved Yucca. [*Y. angustissima* var. *avia* Reveal, type from Loa Pass, Piute County]. Plants acaulescent or rarely short-stemmed, solitary or clumped with numerous rosettes; leaves plano-convex, linear, flexible, 1.5–4.5 dm long, 4–8 mm wide, the margins white or greenish white, in age eventually filiferous with fine curled fibers; inflorescence to 1.8 m tall, racemose, occasionally with a few branches, the peduncle much surpassing the leaves; flowers campanulate to globose, pendant, greenish white, the segments elliptic, 3–5 cm long, 2.5–3.5 cm wide, tinged dorsally with rose or rose purple; ovary 1–2.8 cm long; style white to pale green, 10–13 mm long; capsule 3–4.5 cm long, commonly with a deep constriction. Typically in sandy sites in warm desert shrub, sagebrush, pinyon-juniper, and ponderosa pine communities at 1100 to 2675 m in Garfield, Grand, Kane, Piute, San Juan, Sevier, Washington, and Wayne counties; Colorado to New Mexico, Arizona, and Nevada; 38 (xxvi). The var. *avia* Reveal of Piute county is at the northern limits of the species, and seemingly represents a high altitude form at the end of a cline. There are intermediates between narrow-leaved yucca and *Y. baileyi*, *Y. kanabensis*, and *Y. toftiae*. This plant was used prehistorically as a source of fiber for cordage and textiles. Both Basketmaker and Pueblo cultures depended on this and other species of yucca for many aspects of their civilization.

Yucca baccata Torr. Datil Yucca. Plants simple or clumped at ground level, rarely caulescent with 2–6 short, procumbent stems; leaves broadened near the middle, straight or incurved, occasionally twisted, rather deeply concavo-convex, rigid, 3–10 dm long, (1.5) 2.5–5 (6) cm wide, the margins usually with coarse fibers; inflorescence 3.5–6.5 dm long, paniculate, hidden by the leaves or only somewhat surpassing them; flowers campanulate, pendent, white to cream colored, commonly tinged with purple, the segments lanceolate to oblanceolate, 4–8 (11.5) cm long, 1.4–3 cm wide; ovary 3.8–7 cm long, narrowly ovoid and tapering to the style, this 4–10

mm long, tapered; capsule 8–17 cm long or more, 3–6 cm wide, fleshy and sweet at maturity. Two rather distinctive varieties occur in Utah.

- 1. Leaf blade straight, dark green, glabrous; scape and pedicels green, typically surpassing the leaves; plants broadly distributed *Y. baccata* var. *baccata*
- Leaf blade falcate, blue green, glaucous; scape and pedicels reddish purple, typically shorter than the leaves; plants of Kane (?) and Washington counties *Y. baccata* var. *vespertina*

Var. *baccata* Dry, sandy or rocky slopes and mesas in pinyon-juniper, sagebrush, mountain brush, and ponderosa pine communities at 1200 to 2400 m in Beaver, Iron, Kane, San Juan, and Washington counties; California, Nevada, Arizona, Colorado, New Mexico, Texas, and Mexico; 8 (iii).

Var. *vespertina* McKelvey Creosote bush, Joshua tree, blackbrush, and other warm desert shrub and pinyon-juniper communities at 750 to 1700 m in Kane (?) and Washington counties; California, Nevada, and Arizona; 9 (iv).

Yucca baileyi Woot. & Standl. Bailey Yucca. [*Yucca standleyi* McKelvey; *Y. navajoa* Webber]. Plants acaulescent or rarely with a short, ascending stem, solitary or clumped; leaves linear, plano-convex, flexible, often falcate, 2–6 dm long, 3–8 mm wide, pale green or yellow green, the margin white, soon filiferous; inflorescence racemose, 3.5–12 dm long, unbranched, usually not much surpassing the foliage, densely flowered; flowers campanulate to globose, greenish white, tinged with purple, the segments thin, ovate to obovate, 4–6 cm long, 2–3 cm wide; ovary 2.3–2.9 cm long, oblong to obovoid; style white to pale green, 7–9 mm long; capsule oblong, seldom constricted, 4–7 cm long, 2–5 cm wide, pendulous at maturity. Grassland, Mormon tea, Vanclveva, mixed warm desert shrub, pinyon-juniper, and ponderosa pine communities at 1200 to 2200 m in Garfield, Grand, Kane, and San Juan counties; Colorado, Arizona, and New Mexico; 9 (i).

Yucca brevifolia Engelm. Joshua Tree. [*Y. draconis* var. *arborescens* Torr.; *Y. arborescens* (Torr.) Trel.]. Plants arborescent, with 1 to several large stems, mainly 1–4 m tall, the branches erect or ascending (or pendulous in age); leaves numerous, linear-acicular, spinulose apically, plano-convex to triquetrous, rigid, 1.5–3.5 dm long, 0.7–1.5 cm wide, the margin thin, horny, minutely denticulate; inflorescence a compact panicle, 2–4 dm long, dense, ovoid; flowers ellipsoid to globose, scarcely expanding, greenish-white to cream, the segments thick and succulent, oblong to lanceolate, 2.5–4.5 (5) cm long, 1–2 cm wide; ovary 2–3.5 cm long, tapering from base to apex, pale green; style 0–4 mm long; capsule ellipsoid, 6–8.5 cm long, 3–4.5 cm wide, dry and spongy at maturity. Bajadas and slopes in creosote bush, blackbrush, other warm desert shrub, and pinyon-juniper communities at 800 to 2200 m in Washington County; California, Nevada, and Arizona; Mexico; 7 (v). A single Joshua tree waif stands near the Red Mound in the Monroe Hot Springs area of Sevier County. Its status as indigenous or introduced is recondit. The species is successfully grown as far north as Salt Lake City.

Yucca harrimaniae Trel. Harriman Yucca. [*Y. harrimaniae* var. *gilbertiana* Trel., type from Juab County; *Y. gilbertiana* (Trel.) Rydb.]. Plants acaulescent, forming

dense small clumps of 1–22 rosettes; leaves falcate or straight, lanceolate to spatulate-lanceolate, concavo-convex, deeply striate, rather thick and rigid, pale green, pungent apically, 1–5 dm long, 0.7–4 cm wide, the margin white or brown, in age filiferous, the fibers somewhat coarse and curly; inflorescence 3.5–7 dm tall, racemose or rarely with a few short branchlets, extending from within the foliage to well above; flowers broadly campanulate, pendent, yellowish or greenish yellow to cream, tinged with purple, the segments broad, 4–5 (6) cm long, 1.6–3.5 cm broad; ovary 1.5–2 cm long, pale green; style 9–11 mm long, bright green; capsule cylindrical, with a short attenuate beak, 3.7–5 (6) cm long, usually deeply constricted toward the center and flaring open when dried. Warm desert shrub, grasslands, sagebrush, pinyon-juniper, and mountain brush communities at 1200 to 2700 m in Beaver, Carbon (type from near Helper), Duchesne, Emery, Garfield, Grand, Iron, Juab, Millard, Piute, San Juan, Sevier, Uintah, and Wayne counties; Nevada, Colorado, Arizona, and New Mexico; 42 (xii). This species, with both Great Basin and Colorado Drainage distribution, is the most widely distributed of our species. It forms apparent intermediates with *Y. angustissima* in eastern Utah. Plants from western Utah have been regarded as *Y. harrimaniae* var. *gilbertiana*. Except for the more robust size of most individuals, the Great Basin materials seem not to differ substantially. In the lower elevation portions of the Uinta Basin there is a strongly rhizomatous phase of the species with flaccid leaves that tend to sprawl on the surface of the ground. Leaf margins tend to be less filiferous than in the species proper. These plants have been collected in flower, but are not known to produce fruit. They are designated as var. *sterilis* Neese & Welsh (type from Uintah County).

Yucca kanabensis McKelvey Kanab Yucca. [*Y. angustissima* var. *kanabensis* (McKelvey) Reveal]. Plants acaulescent or short-caulescent, forming small to large clumps; leaves linear, 4.5–8 dm long, 7–15 (20) mm wide, concavo-convex, stiff but flexible, the margin white, soon with straight or curled fibers; inflorescence mostly 1.5–3 m tall, racemose or with 3–4 short branchlets, the short peduncle and lower portion of inflorescence usually included among the leaves; flowers large, campanulate to globose, white to greenish white or cream, often tinged purplish dorsally, the segments elliptic to nearly orbicular (4) 5.5–6.5 cm long, 2.3–4 cm broad; ovary oblong, 2.3–3 cm long; style short, 3–7 mm long; capsule cylindrical, oblong, 6.5–7.5 cm long, sometimes constricted, roughened. Sandy soils in sagebrush, mountain brush, pinyon-juniper, and ponderosa pine communities at 1300 to 2300 m in Kane (type from 8 mi nw of Kanab) and Washington counties; Arizona; 16 (vi). The Kanab yucca occurs mainly from Zion Canyon east to Johnson Canyon, with the greatest concentration northwest of Kanab, in the vicinity of the Coral Pink Sand Dunes. It is truly one of our most striking species. It forms intermediates westward with *Y. utahensis* and eastward with *Y. angustissima*.

Yucca schidigera Roezl ex Ortega Plants shrublike or arborescent, single or clumped; stems erect, mainly 0.5–2.5 m tall, simple or branched; leaves linear to linear-lanceolate, 3–10 dm long, 2.5–5 cm broad, concavo-convex, thick, very rigid, yellow green, the margin thick, usually with coarse curved fibers; inflorescence paniculate, 5–13 dm long, mostly contained within the foliage;

flowers globose, white or cream, tinged with purple, the segments lanceolate to broadly lanceolate, 2.4–4.5 cm long, 0.6–1 cm wide; ovary 1.8–2.5 cm long; style 1–2 mm long; fruit cylindrical, 7–10.5 cm long, fleshy, sweet and succulent. Bajadas in mixed warm desert shrub and Joshua trees at 900 to 1500 m in Washington County; California, Nevada, and Arizona; 5 (ii). The plant occurs as an introduction at Castle Cliffs, and is native on the bajadas along the road to Beaver Dam Wash west of Castle Cliffs.

Yucca toftiae Welsh Toft Yucca. [*Y. angustissima* var. *toftiae* (Welsh) Reveal]. Plants acaulescent or with stems to 1 m long, solitary or clumped; leaves linear 2–8 dm long, 4–17 mm wide, plano-convex to concavo-convex, green to yellow green, the margins white, soon filiferous; inflorescence mostly 1.2–3.4 m tall, racemose or paniculate (with 2–18 lateral branches), the peduncle much surpassing the foliage; flowers campanulate to globose, white to cream, the segments elliptic to lance-ovate, acute, 2.5–5.2 cm long; ovary 1.5–3.2 cm long; style (3) 7–11 mm long; capsule erect, cylindrical, woody, and somewhat constricted near the middle, 4.6–5.5 (6) cm long. Sandstone outcrops and hanging gardens in warm desert shrub communities along Glen Canyon (type locality) and the San Juan River arms of Lake Powell and the southern portion of the Kaiparowits Plateau in Garfield, Kane, and San Juan counties; endemic; 5 (iii). McKelvey indicates that this plant was described to her in a letter received from Miss E. U. Clover, who noted the plant in her exploration of the canyons of the Colorado.

Yucca utahensis McKelvey Utah Yucca. [*Y. elata* var. *utahensis* (McKelvey) Reveal]. Plants usually caulescent, the stems to 1.3 m tall, forming clusters of up to 15 rosettes; leaves linear, (2) 4–7.5 dm long, 7–20 mm wide, broadest near the middle, concavo-convex, flexible, yellow green, the margins white, with a few fibers; inflorescence paniculate, 1.2–2 m long, the peduncle produced well above the foliage; flowers campanulate, cream, the segments broadly elliptic or ovate, 3.5–5 cm long, 2–2.5 cm wide; ovary 2.5–3 cm long; style white, very slender, 5–10 mm long; capsule oblong-cylindrical, 4–7 (8) cm long, not or only slightly constricted. Sandy soils in creosote bush, blackbrush, sand sagebrush, other warm desert shrub, and pinyon-juniper communities at 930 to 1850 m in Washington (type from northwest of St. George) County; Nevada and Arizona; 11 (iv). This entity is disjunct from *Y. elata*. It is in contact, instead, with *Y. kanabensis*, with which it forms occasional intermediates, and with whom its alliance is as great or greater than with the allopatric *Y. elata*.

ALISMACEAE Vent.

Water-plantain Family

Herbaceous aquatic or marsh perennials from a thickened rootstock and fibrous roots; leaves basal, long-petioled, erect or floating, the veins longitudinal and prominent; flowers perfect or imperfect, subtended by a whorl of bracts, in racemes or panicles; sepals 3, green; petals 3, white or pink, often large and showy; stamens 6 or more, distinct, hypogynous, the anthers 2-loculed; pistils several to many; style terminal, persistent; $x = 6, 7, 8, 11$.

1. Leaves sagittate; flowers dioecious, monoecious, or sometimes polygamous *Sagittaria*
 — Leaf blades elliptic, ovate, or rarely cordate, but not sagittate; flowers perfect 2
 2(i). Stamens 6 (rarely 9); flowers rather small and inconspicuous; petals 2–6 mm long; achenes arranged in a single whorl on the receptacle *Alisma*
 — Stamens 12; flowers rather showy; petals 5–10 mm long; achenes in a burlike head *Echinodorus*

Alisma L.

Scapose perennial herbs with fibrous roots; leaves basal, erect or floating; flowers in compound, whorled panicles, perfect and somewhat inconspicuous; sepals 3, broad, persistent; petals 3, white or pink, deciduous; stamens 6 (rarely 9); carpels 10–25 in a single whorl, each distinct; fruit of achenes.

1. Leaves broad, usually 3–8 cm wide, broadly elliptic to ovate or oblong; achenes with a central groove along the center of the outer edge and top, 2–2.8 mm long, somewhat longer than broad; fruiting pedicels ascending to erect, at least some over 2 cm long . . . *A. plantago-aquatica*
 — Leaves narrow, mostly 0.3–2 cm wide, narrowly elliptic to linear; achenes with a central ridge and a groove on the center of the outer edge and top, ca 2 mm long, suborbicular; pedicels spreading to recurved, mostly less than 2 cm long *A. gramineum*

Alisma gramineum Lej. [*A. geyeri* Torr. ex Nicotlet]. Perennial herbs 0.6–5.2 dm tall; leaves all basal, erect or floating, often extending above the inflorescence, long-petiolate, the blade 2.5–7 (9) cm long, 0.5–2 cm wide, narrowly elliptic to linear, the petiole sheathing, equaling the blade in length or more often much longer; scapes bracteate, paniculately compound, erect, mostly shorter than the leaves; bracts lanceolate, papery; pedicels spreading to recurved, mostly less than 2 cm long; sepals green, 1.5–3 mm long, persistent; petals white or pinkish, 2–4 mm long; stamens 6–9; pistils 10–25 in a single whorl; style curved, 0.4–0.5 mm long; achenes ca 2 mm long; $2n = 14, 16$. Ponds, reservoirs, and marshes, growing in mud or submersed, at 1400 to 2260 m in Duchesne, Millard, Rich, and Uintah counties; widely distributed in North America; Eurasia; 14 (ii).

Alisma plantago-aquatica L. [*A. triviale* Pursh; *A. brevipes* Greene]. Perennial herbs 2–8.9 dm tall; leaves all basal, erect, often shorter than the inflorescence, long-petiolate, the blade 4–17 cm long, 2–8 cm wide, broadly elliptic to ovate or oblong, the petiole 2.5–32 cm long, sheathing; scapes erect, 1 to few and mostly paniculately compound, bracteate, longer than the leaves; bracts lanceolate, papery, 2–3 mm long; pedicels ascending to erect, 0.5–4 cm long; sepals greenish, 3–4 mm long, persistent; stamens 6; pistils 10–22, in a single whorl; style usually straight, 0.5–0.7 mm long; achenes 2–2.8 mm long; $2n = 12, 14, 24, 28$. Mud flats, open water and wet meadows at 1340 to 2320 m in Cache, Daggett, Rich, Utah, Washington, and Weber counties; widely distributed in the U. S.; Canada; Eurasia, Africa, Australia, and South America; 19 (i).

Echinodorus Rich.

Submersed or amphibious annuals from fleshy rhizomes; leaves erect or ascending, emergent or floating, all basal; flowers several, bracteate, in panicles or racemes,

perfect, 3–merous; sepals persistent, green; petals deciduous; stamens 12; pistils in a dense cluster, numerous; achenes flattened.

Echinodorus rostratus (Nutt.) Engelm. ex Gray [*Alisma rostrata* Nutt.; *E. rostratus* var. *lanceolatus* Engelm. ex Wats. & Coult.]. Annual herbs, mainly 1.1–3.7 dm tall; leaves basal, erect to ascending or floating, the blades elliptic to broadly lanceolate, 3–9 cm long, 0.5–4.5 cm wide, sheathing, petioled, the petioles subequal to the blade or somewhat longer, shorter than the inflorescence; scapes erect, few, the flowers clustered; bracts linear-lanceolate with hyaline margins; pedicels spreading to ascending, to 1.4 cm long; sepals broad, persistent, dark green, 2–4 mm long; petals rhombic, 5–9 mm long, white to greenish white; stamens 1–2 mm long; pistils many, compact; style longer than the ovary; achenes 2–3 mm long, ribbed, the beak stout, 1–2 mm long, persistent, the fruiting head burlike. Mud flats, lake shores, and marshes at ca 1400 to 1450 m in Millard and Uintah counties; California to Texas, east to Illinois, and south to Mexico; 5 (i).

Sagittaria L.

Perennial aquatic herbs; leaves erect to spreading or floating, long-petioled, sagittate; inflorescence a long, verticillate panicle; flowers mostly monoecious; sepals persistent, greenish; petals deciduous, white, longer than the sepals; stamens many; pistils many on an enlarged receptacle; fruit an achene.

Sagittaria cuneata Sheldon [*S. arifolia* Nutt., *S. arifolia* var. *cuneata* Lunell]. Submersed to emergent, glabrous, perennial herbs, mainly 1.1–6 dm tall; leaves basal, the blades typically sagittate with the two basal lobes narrower and shorter than the upper one, this 2–11 cm long, 1–7 cm wide; petioles sheathing, to 4.5 dm long and much broader near the base; scapes simple or branched, erect, with 2–7 whorls of flowers; bracts lanceolate, membranous, 6–20 mm long; pedicels mostly ascending, 5–33 mm long; staminate flowers usually above and the pistillate below; sepals 4–8 mm long, persistent, ovate; petals 6–14 mm long, white, with a narrow claw and an expanded blade; stamens 15–22; pistils many; fruiting heads 1–1.5 cm thick, globose; achenes obovate, flattened, 2–3 mm long, with a short, erect, straight or curved beak and dorsal wing. Streams, marshes, lakes, and mudflats at 1370 to 2745 m in Beaver, Cache, Daggett, Garfield, Grand, Piute, Rich, Sanpete, Sevier, Uintah, Utah, and Weber counties; rather widely distributed in the U. S.; Canada; 30 (i). Another species, *S. latifolia* Willd., might occur in Utah, but no specimens were seen by me. It is distinguished from *S. cuneata* in having achenes with beaks extending at right angles to the upper body, the leaf lobes more or less equal in length, and bracts mostly 5–10 mm long.

AMARYLLIDACEAE J. St. Hil.

Amaryllis Family

Perennial acaulescent herbs from corms or bulbs; leaves basal and alternate, entire; flowers perfect, the perianth of 6 parts; stamens 6; stigma 3-lobed; ovary inferior, 3-loculed; fruit a loculicidal capsule or a berry; seeds mainly flat or subglobose, in 2 rows per locule; $x = 5, 7, 9, 10–15$. Note: The members of this family keyed

below are all known from introduced, cultivated individuals. However, some persist for long periods of time following cultivation and others occur as waifs along roadsides and at refuse dumps.

- 1. Flowers white, nodding, borne in late winter and early spring, as the snow melts *Galanthus*
- Flowers yellow, cream, pink, scarlet, red, candy-striped, or white, borne in spring or under glass in autumn, winter, and spring 2
- 2(1). Flowers with a definite corona, this forming a tube or ring between the perianth and stamens; perianth typically yellow or cream, less commonly white; plants typically grown outside *Narcissus*
- Flowers with corona inconspicuous, if formed at all; perianth commonly red, pink, or white; plants typically grown inside *Hippeastrum*

***Galanthus* L.**

Bulbous, scapose herbs, the bulbs with membranous outer scales; leaves typically 2, linear to narrowly oblong, flowers solitary; perianth segments distinct, the 3 inner ones shorter, overlapping and appearing tubular; fruit a berry.

Galanthus nivalis L. Snowdrop. Plants from small bulbs; leaves 2, appearing with the flowers, linear, mainly 6–10 cm long and 6 mm wide; flowers solitary, nodding, white, subtended by a papery spathe, this split on one side, 20–25 mm wide, the outer segments white, spreading, the inner erect, white, with green markings around the sinus apically; fruit green; 2n = 18, 24, 36. Commonly grown ornamental, flowering optimistically as early as mid-February, while snow persists on the beds, in most if not all Utah counties; introduced from Europe; 2 (0).

***Hippeastrum* Herbert**

Bulbous, scapose herbs, the bulbs with papery outer scales; leaves linear to oblong, usually several; umbels 1- or more-flowered, usually declined, subtended by distinct spathaceous bracts; perianth tube short; stamens declined, unequal, of several different lengths; style declined, the stigma 3-lobed; fruit a loculicidal capsule.

Hippeastrum striatum (Lam.) H. Moore *Amaryllis*. [*Amaryllis striata* Lam.]. Leaves strap-shaped, 10–30 cm long or more, 1–4 cm wide; scapes 1.5–4 dm tall, fistulose; spathes green or whitish, or suffused with anthocyanins; umbels 1- to 4-flowered; flowers large and showy, crimson, pink, white, scarlet, or salmon, mainly 5–15 cm long and as broad or broader; fruit seldom formed. Cultivated ornamental of startling beauty, grown mainly under glass, and offered for sale mainly in winter and early spring; sometimes grown outside in summer; introduced from South America; 1 (0). Material included in the above description is probably of hybrid origin, involving *H. audicum* (Ker Gawler) Herbert, *H. elegans* (Sprengel) H. Moore, *H. reginae* (L.) Herbert, and others.

***Narcissus* L.**

Scapose bulbous herbs; leaves linear, usually several; flowers 1 to several, borne in umbels subtended by a single braetate spathe; perianth yellow or white, with a long and tubular or short ringlike corona separate from the filaments; fruit a capsule with subglobose black seeds.

- 1. Leaves nearly terete, narrowly channeled on the face; corona much shorter than the perianth segments; flowers yellow, 2–6 per umbel *N. jonquilla*
- Leaves flat or nearly so; corona shorter to longer than the perianth segments; flowers yellow, cream, or white, solitary to many per umbel 2
- 2(1). Corona equaling or surpassing the perianth segments, these spreading; our most common species *N. pseudo-narcissus*
- Corona less than half as long as the perianth segments; plants common to uncommon 3
- 3(2). Corona with the margin red to red orange, shallowly cup-shaped; flowers mostly solitary *N. poeticus*
- Corona not margined with red, deeply cup-shaped to shortly tubular; flowers often 4 or more per umbel *N. tazetta*

Narcissus jonquilla L. Jonquil. Leaves mainly 10–30 cm long, narrow; flowers mostly 2–6, yellow, fragrant; perianth tube 2–2.5 cm long; corona margin undulate, less than half as long as the spreading perianth segments; 2n = 14, 21. Commonly grown ornamental, long persisting in lower elevation portions of Utah; introduced from Europe and Africa; 1 (0).

Narcissus poeticus L. Poets Narcissus. Leaves mainly 10–30 cm long, 4–7 mm wide; flowers mostly solitary, white, fragrant; perianth tube mainly 20–25 mm long; corona short, with undulate red margin, much shorter than the segments; 2n = 14, 21, 28. Commonly grown ornamental of charm and beauty, long persisting in lower elevation portions of Utah; introduced from Europe; 1 (0).

Narcissus pseudo-narcissus L. Daffodil. Leaves mainly 1.5–30 cm long and 10–20 mm wide; flowers solitary, spreading or deflexed, yellow, with greenish perianth tube mainly 12–20 mm long; corona undulate-cripsed, bright yellow, subequal to or surpassing the perianth segments; 2n = 14, 15, 21, 26–29, 30, 35+. Commonly grown ornamental, often available as cut flowers, in much of lower elevation portions of Utah; introduced from Europe; 5 (ii).

Narcissus tazetta L. Polyanthus Narcissus. Leaves mainly 10–30 cm long and 15–20 mm wide; flowers typically 4–8, white, fragrant; perianth tube mainly 20–25 mm long; corona pale yellow or white, much shorter than the segments; 2n = 20, 30, 32. Occasionally grown ornamental, but commonly forced, and offered for sale as early as late autumn; introduced from Europe; 2 (0).

COMMELINACEAE R. Br.

Spiderwort Family

Herbaceous perennials; stems erect, mostly glabrous, stout; leaves typically cauline, alternate, narrow, distinctly parallel-veined; flowers perfect, showy, 3-merous, differentiated into sepals and petals; sepals distinct, imbricate, green; petals free, alternate with the sepals and colored; stamens 6, in 2 series, the filaments flattened basally; anthers basifixed; ovary superior, sessile, 3-loculed, with 1 or 2 ovules per locule; style 1; fruit a loculicidal capsule, enclosed by fleshy sepals; seeds 1–6; x = 4–19.

***Tradescantia* L.**

Plants with thickened, fleshy roots; leaves alternate, linear-lanceolate, sessile, sheathing at the base; flowers

blue, violet, or magenta, subtended by leafy bracts, pedicellate; cymes terminal; sepals 3, distinct, persistent, glandular; petals purple, homomorphic, separate; stamens 6, the filaments pilose; ovary with the stigma capitate; seeds small.

Tridascantia occidentalis (Britt.) Smyth Spiderwort. [*T. virginiana* var. *occidentalis* Britt. in Britt. & Br.]. Erect perennial, 2–4 (5) dm tall; stems strict or ascending, glabrous, glaucous; leaves linear-lanceolate, membranaceous, long-acuminate, stiff, divaricate, 0.7–3.7 dm long, 0.2–1 cm wide, the uppermost the smallest, swollen at juncture with the node and forming a sheath; flowers in umbellate clusters, terminating the main stem and axillary, the clusters subtended by 2 or 3 leafy, divaricate bracts up to 2 dm long; flowers long-pedicellate, the pedicels erect or spreading to deflexed, glandular, 1–2 cm long, broadly campanulate; sepals green or tinged with purple, elliptic, glandular-puberulent or glabrous; petals broadly ovate, 7–15 mm long, blue to magenta; filaments densely pilose; capsules oblong, pubescent, 4–7 mm long; seeds 2–4 mm long, compressed; $2n = 24$. Mostly in sandy substrates of the lower ponderosa pine community and mixed desert shrub and shrub-grass communities at 1250 to 2135 m in Garfield, Kane, San Juan, and Washington counties; Arizona east to Texas, north to North Dakota; 33 (iii). The ornamental, *T. virginiana* L., is occasionally cultivated in Utah. It is distinguished by its glabrous to villous, but not glandular sepals.

CYPERACEAE A. L. Juss.

Sedge Family

Grasslike, perennial or annual herbs; culms (stems) triangular, rounded, or flattened in cross section, not jointed; leaves simple, linear, entire, 3-ranked, sometimes reduced to bladeless sheaths, these mostly closed; inflorescence spicate, racemose, or umbellate, of 1 to many spikes or spikelets; flowers much reduced, imperfect or perfect, sessile or nearly so, subtended by a very small bract (lemma), referred to as a scale; perianth lacking or reduced to bristles; stamens usually 3, rarely 1 or 2, exerted at anthesis, the anther basifixed; ovary superior; stigmas 2 or 3, the achenes accordingly lenticular or trigonous; $x = 5-60+$.

Cronquist, A., A. H. Holmgren, N. H. Holmgren, J. L. Reveal, and P. K. Holmgren. 1977. Intermountain flora, Vol. 6, Columbia University Press, New York, 584 pp.

- 1. Achenes enclosed by or folded within a closed or open sac or small bract as well as subtended by a scale; perianth bristles lacking; flowers imperfect 2
 - Achenes exposed, neither enveloped by nor enfolded in a sac or bract, merely subtended by a scale and usually by perianth bristles (except in *Cyperus*); flowers mostly perfect (except in *Cladium*) 3
- 2(1). Achene completely enclosed in a sac (perigynium), this closed except at the apex, through which the stigmas are exerted, concealing the attachment of the style to the achene *Carex*
 - Upper part of achene usually exposed, the subtending bract with open margins, exposing the attachment of the style to the achene *Kobresia*
- 3(1). Perianth bristles more than 10, much exceeding the scales, appearing as cottonlike tufts; plants of the Uinta Mts. *Eriophorum*

- Perianth bristles fewer than 10, equal to or shorter than the scales, not forming cottonlike tufts; plants widespread 4
- 4(3). Inflorescence a solitary spike, not subtended by leafy bracts; leaves reduced to bladeless sheaths (*Scirpus caespitosus* is also keyed here) *Eleocharis*
 - Inflorescence usually with few to many spikelets, these sometimes umbellate, subtended by 1 or more leafy bracts; leaves various but some commonly with conspicuous blades 5
- 5(4). Lower scales empty; flowers in each spike all staminate except the terminal perfect one; plants 1–2 m tall, with leafy stems and foliose bracts, of canyonlands in Kane and San Juan counties *Cladium*
 - Scales typically all subtending flowers, these mostly perfect; plants various, but seldom if ever as above 6
- 6(5). Scales arranged in 2 vertical ranks; perianth lacking *Cyperus*
 - Scales spirally arranged; perianth various 7
- 7(6). Perianth lacking; styles thickened toward the base; plants rather rare *Fimbristylis*
 - Perianth commonly of bristles; styles not thickened toward the base; plants often common *Scirpus*

Carex L.

Plants perennial, monoecious or occasionally dioecious; stems tufted or arising singly or few together from creeping rhizomes; spike solitary or few to several, sessile, congested or remote, pedunculate, short to elongate, staminate, pistillate, androgynous (staminate flowers borne above the pistillate ones), or gynaeandrous (pistillate flowers borne above the staminate ones), each with few to many unisexual, sessile or short-stipitate flowers; perianth lacking; staminate flowers with 2 or 3 stamens, the pistillate of a pistil, this enveloped in a closed scale or saclike perigynium with the stigmas exerted from the apex.

Hermann F. J. 1970. Manual of the Carices of the Rocky Mountains and Colorado Basin. U. S. D. A. Agr. Handbook No. 374. 397 pp.
 Lewis M. E. 1958. *Carex*—its distribution and importance in Utah, Brigham Young Univ. Sci. Bull., Biol. Ser. 1, No. 2, Provo, Utah. 43 pp.
 Mackenzie K. K. 1931–35. *Carex* L. Fl. N. Amer. 18: 9–478

- 1. Spike solitary, the perigynia attached directly to the rachis Key 1
 - Spikes more than 1, the perigynia attached to a rachilla and the rachilla attached to the rachis 2
- 2(1). Spikes all sessile, aggregated into a capitate or spicate inflorescence, the terminal one not staminate and the lower ones commonly not all pistillate except in imperfect specimens 3
 - Spikes peduncled (at least some) or, if sessile, well separated from the upper ones or the terminal one staminate; lower 1–5 spikes typically all pistillate; plants monoecious 6
- 3(2). Stigmas 3; achenes trigonous; inflorescence with 3–5 spikes, often subtended by a leaflike bract; terminal spike gynaeandrous, the lateral ones all pistillate; pistillate scales black or blackish purple (section *Atratae*) Key 5
 - Stigmas 2; achenes lenticular; inflorescence commonly with more than 5 spikes, or the pistillate scales paler than above, not subtended by a leaflike bract (except in *C. athrostachya*); spikes typically all androgynous or all gynaeandrous 4

- 4(3). Spikes typically androgynous or the plants with well-developed creeping rhizomes Key 2
 - Spikes gynaeceandrous; plants caespitose; rhizomes lacking or very short 5
 - 5(4). Perigynia round-margined, not winged, not conspicuously flattened, mostly less than 3.5 mm long (longer in *C. deveyana*); scales pale green to brown; inflorescence commonly less than 2 cm long and/or less than 1 cm wide; plants mostly of wet places Key 3
 - Perigynia wing-margined, often conspicuously flattened, (2.5) 3.5–7.5 (8) mm long; scales commonly brownish to dark brown, often with a green midrib; inflorescence often longer or wider than above; plants of dry or wet places (Section Ovale) Key 4
 - 6(2). Terminal spike gynaeceandrous, the lateral ones all pistillate or gynaeceandrous with very few staminate flowers; pistillate scales dark brown purple to black; plants tufted, lacking rhizomes or these very short (except in *C. buxbaumii*) Key 5
 - Terminal spike and sometimes 1 or more lateral ones staminate or androgynous (the terminal spike occasionally gynaeceandrous in a few taxa but the scales then pale green or, if brown, the culms from slender rhizomes) . . . 7
 - 7(6). Stigmas 2; achenes lenticular; scales often black or black purple or with blackish lines flanking a greenish or pale midstripe, often contrasting with the greenish or stramineous perigynia; plants commonly of wet places Key 6
 - Stigmas 3; achenes trigonous; scales greenish or brownish or, if blackish, usually of the same color as the perigynia (except in *C. raynoldsii* of well-drained soil) . . 8
 - 8(7). Spikes all androgynous; staminate flowers few, inconspicuous and exceeded by the upper perigynia; lower pistillate scales leaflike, greatly exceeding the perigynia, commonly 1–7 cm long; achenes ca 3 mm long . . . *C. backii*
 - Spikes rarely all androgynous; pistillate scales not leaflike, much shorter than above; achenes mostly smaller Key 7
- Key 1.
- Spike solitary.
- 1. Spike unisexual; scales very dark brown purple to black 2
 - Spike androgynous; scales green to dark brown 4
 - 2(1). Perigynia glabrous or nearly so; unusual specimens *C. parryana*
 - Perigynia pubescent 3
 - 3(2). Plants densely caespitose, lacking rhizomes or these very short, 21–40 cm tall, of canyonlands in Kane and San Juan counties *C. curatorum*
 - Plants rhizomatous, loosely to not at all caespitose, 4–34 cm tall, montane in the northern 1/2 of Utah . . . *C. scripoides*
 - 4(1). Plants densely caespitose, often fasciculate; rhizomes lacking or not evident; leaf blades rarely over 1 mm wide 5
 - Plants caespitose or not, but with conspicuous rhizomes, or if rhizomes lacking, the leaves over 1 mm wide 9
 - 5(4). Perigynia blunt at the retuse apex, not conspicuously beaked; leaves and culms lax to flaccid; plants rare, of very wet sites at ca 2200 m in the Uinta Mts. *C. leptalea*
 - Perigynia beaked; leaf blades and stems rather strict; plants mostly of dry places and/or of higher elevations 6
 - 6(5). Rachilla lacking; perigynia shortly stipitate, somewhat to widely spreading; pistillate scales deciduous in age, about as wide as the perigynia; leaves flat or slightly channeled; plants rare *C. pyrenaica*
 - Rachilla subequal to or longer than the achene; perigynia sessile, appressed or nearly so; pistillate scales persistent, usually wider than the perigynia; leaves involute; plants variously abundant 7
 - 7(6). Perigynia minutely hirtellous at least in the upper 1/2 (use 15–20x magnification); spikes 1.3–2.5 cm long, the staminate portion exceeding the uppermost perigynia by ca 8–13 mm; plants below 2300 m . . . *C. filifolia*
 - Perigynia glabrous or serrulate-ciliolate or with a few minute hairs near the beak; spikes 0.5–1.8 cm long, the staminate portion exceeding the uppermost perigynia by 2–7 mm; plants above 2800 m 8
 - 8(7). Perigynia with conspicuous flattened margins, these commonly serrulate-ciliolate; spikes equaling or included in the leaves, the staminate part inconspicuous, exceeding the uppermost perigynia by ca 2–3 mm; scales conspicuously greenish or pale along the midrib, subequal to or a little wider than the perigynia; stigmas 2 or 3 (see also *C. capitata*) . . . *C. nardina*
 - Perigynia with rounded or somewhat involute margins, glabrous, or rarely serrulate-ciliolate, or with a few minute hairs near the beak; spikes equaling or exceeding the leaves, the staminate part usually conspicuous and exceeding the uppermost perigynia by ca 3–7 mm; scales mostly not conspicuously green or pale along the midrib, wider than the perigynia; stigmas 3 *C. elynoides*
 - 9(4). Stigmas 2; achenes lenticular; leaves to ca 1 mm wide 10
 - Stigmas 3; achenes trigonous; leaves various 11
 - 10(9). Perigynia plump, widely spreading at maturity, conspicuously nerved dorsally, the wall thick and spongy; rachilla obsolete; culms arising singly from very slender, long rhizomes *C. dioica*
 - Perigynia flattened, ascending to loosely spreading, very finely nerved dorsally, the wall thin; rachilla over 1/2 as long as the achene; culms arising from stout, very short rhizomes *C. capitata*
 - 11(9). Spikes with only 1 or 2 perigynia 5–6 mm long, the staminate portion 1–2 (3) cm long *C. geyeri*
 - Perigynia either more numerous or smaller than above; staminate portion of spike usually less than 1 cm long 12
 - 12(11). Rachilla exerted beyond the orifice of the perigynium; perigynia soon strongly reflexed, these and the scales early deciduous, greenish or pale brown; plants rare and restricted *C. microglochis*
 - Rachilla lacking or included in the perigynia; perigynia ascending and persistent or, if strongly spreading and deciduous, these and the scales black or blackish purple at least in part; plants various 13
 - 13(12). Leaves (at least some) exceeding the spikes, often strongly curved to completely curled at the tip; rachilla lacking; plants alpine on the Uinta Mts. . . . *C. rupestris*
 - Leaves mostly exceeded by the spikes, straight or at least not curled; rachilla subequal to the achene (except in *C. nigricans*) 14

- 14(13). Rachilla lacking; perigynia narrowed to a substipitate base, ascending at first, these and the scales widely spreading and deciduous in age *C. nigricans*
- Rachilla subequal to the achene; perigynia sessile or inconspicuously stipitate, these and the scales ascending and persistent 15
- 15(14). Perigynia firm, mostly 1–6 per spike; achenes filling the perigynia; plants occasional or locally common *C. obtusata*
- Perigynia thin, mostly more than 6 per spike; achenes various; plants rare (Section Inflatae) 16
- 16(15). Perigynia 4–7.5 mm long, mostly over 1.8 mm wide; spike 6–12 mm wide, 1.2–2.5 times as long as wide; achenes much smaller than the perigynia; plants of alpine well-drained sites *C. brewerii*
- Perigynia 2.5–3 (4) mm long, to 1.5 mm wide; spike commonly 4–6 mm wide, 2.5–3 times as long as wide; achenes subequal to the perigynia; plants of subalpine wet places *C. subnigricans*

Key 2.

Spikes few to many, sessile, androgynous or unisexual; stigmas 2; achene lenticular.

- 1. Culms arising singly or few together from creeping rhizomes 2
- Culms caespitose; rhizomes lacking or short 10
- 2(1). Spikes mostly widely spaced from each other, with 1–3 staminate and pistillate flowers each, ca 5 mm long; scales and perigynia green *C. disperma*
- Spikes congested into a headlike or continuous spike-like inflorescence, mostly with more flowers and longer than above; scales and perigynia brownish or blackish 3
- 3(2). Spikes closely aggregated into a compact, nearly globose head, not evident without dissecting the head; plants rare, mostly 5–25 cm tall, subalpine 4
- Spikes not so closely aggregated, the lower ones and sometimes the upper readily evident without dissecting the head 6
- 4(3). Perigynia widest below the middle, 2.9–3.8 mm long, 0.9–1.4 mm wide, hardly (if at all) winged, the marginal nerves not much more conspicuous than the facial ones (see lead 11 below) *C. jonesii*
- Perigynia widest near the middle or above, 3.3–4.7 mm long, 1–2.6 mm wide, conspicuously flattened, winged or at least the marginal nerves more conspicuous than the facial ones 5
- 5(4). Perigynia 1.9–2.6 mm wide, 1.5–2 times as wide as long, almost twice as wide as the achenes, not stipitate; leaves 1–2 mm wide, commonly equal to or surpassing the culms; plants from above timberline on the La Sal Mts. *C. perglobosa*
- Perigynia 0.1–1.6 mm wide, (2) 2.5–4.5 times as long as wide, mostly less than 1.5 times as wide as the achene, stipitate; leaves 2–4 mm wide, shorter than the culms; plants known from subalpine meadows on the Uinta Mts. *C. foetida*
- 6(3). Perigynia winged, deeply bidentate, serrulate to below the middle; lateral spikes androgynous or staminate, the upper one often wholly pistillate; plants 19–36 cm tall; rhizomes pale brown *C. siccata*
- Perigynia not winged or scarcely so, bidentate or not, if serrulate, only on the upper half; spikes androgynous or imperfect 7

- 7(6). Perigynia 1.7–2.6 mm long, yellow green or yellow brown, thick-walled and firm especially toward the base; beak of perigynium 0.2–0.5 mm long, slightly winged and serrulate at the confluence of the beak and the body only; plants of boggy meadows *C. simulata*
- Perigynia or their beaks longer than above, the walls rather thin, mostly brownish, wings and serrulations lacking or inconspicuous except in *C. praegracilis* and then usually extending onto the body; plants of dry or wet places 8
- 8(7). Rhizomes averaging 2–4 mm thick, blackish or dark brown; lower leaves reduced to bladeless sheaths, blackish or dark brown; plants 10–70 cm tall, often of wet places; perigynia narrowly winged, serrulate distally and sometimes medially *C. praegracilis*
- Rhizomes less than 2 mm thick, brownish or tan; lower leaves with blades or, if reduced to bladeless sheaths, these pale brown or greenish; plants 8–28 cm tall, mostly of well-drained soil; perigynia wingless, not serrulate or inconspicuously so 9
- 9(8). Plants dioecious; beak of perigynium 1–1.5 mm long; inflorescence 1.5–5.5 cm long, with the most conspicuous coloration due to the hyaline margins of the scales *C. douglasii*
- Plants monoecious, the spikes androgynous, the staminate portion usually conspicuous; inflorescence 0.8–2 cm long, with the most conspicuous coloration coming from the brown or dark brown body of the scales *C. stenophylla*
- 10(1). Inflorescence simple, ovoid or ovoid-oblong or, if linear, the plants of well-drained soil; stature various 11
- Inflorescence compound (some of the lower spikes borne on branched rachillas), usually oblong to linear; plants mostly of wet places, (2) 3–12 dm tall 15
- 11(10). Perigynia abruptly contracted to a beak or conspicuously serrulate; plants of well-drained soil (Section Bracteosae) 12
- Perigynia tapered to a beak, not or inconspicuously serrulate; plants mostly of wet places (Section Vulpinae in part) 14
- 12(11). Perigynia entire or serrulate on the beak only, somewhat rounded on the margins, with the marginal nerves displaced onto the ventral surface, pale green or straw colored, ca 3–7 per spike, the beak not (or very slightly) bidentate *C. vallicola*
- Perigynia serrulate on the beak and usually on the upper 1/2 of the slightly winged margins of the body, with the marginal nerves on the wing-edges or slightly displaced onto the ventral surface, green to dark brown, ca 4–12 per spike, the beak bidentate .. 13
- 13(12). Spikes closely congested into an ovoid or ovoid-oblong head, rarely any of the lower ones noticeably separated, the internodes obscure *C. hoodii*
- Spikes loosely congested into an oblong to linear head or spikelike inflorescence, the lower ones generally noticeably separated, the lowest internode conspicuous, generally 2–7 mm long *C. occidentalis*
- 14(11). Leaves crowded basally; sheaths relatively short, mostly less than 3 cm from one collar to the next, the ventral surface not conspicuously cross-rugose, usually truncate or concave at the mouth and not cartilaginous-thickened; culms 15–30 (40) cm tall, ca 2 mm thick at the base *C. jonesii*

- Leaves more widely spaced; sheaths relatively long, ca 3–5 cm long from one collar to the next, the ventral surface exposed and usually conspicuously cross-
rugose, convex or prolonged and often cartilaginous at the mouth; culms 20–80 cm tall, ca 3.5 mm thick at the base *C. neurophora*
- 15(10). Sheaths conspicuously cross-rugose ventrally; perigynia very gradually tapering to a slender beak, without a keeled dorsal suture *C. stipata*
- Sheaths not cross-rugose ventrally; perigynia more abruptly tapered to the beak, this often with a keeled dorsal suture 16
- 16(15). Leaf sheaths not copper colored at the mouth, not red-dotted; inflorescence 2–3.5 (5) cm long, not interrupted or but slightly so; perigynia 2–3 mm long, not concealed by the scales; leaves 1–2.5 (3) mm wide *C. diandra*
- Leaf sheaths copper colored at the mouth, often red-dotted; inflorescence 3–8 cm long interrupted; perigynia 2.7–4 mm long, nearly concealed by the scales; leaves 3–5 mm wide; plants reported for Utah *C. cusickii* Mack.

Key 3.

Spikes more than 1, sessile, gynaeandrous; stigmas 2; achenes lenticular; perigynia with rounded (wingless) margins.

- 1. Perigynia widely spreading at maturity, the lower ones sometimes reflexed (Section Stellulatae) 2
- Perigynia appressed 3
- 2(1). Beak 1/4–1/3 (1/2) the length of the body, up to ca 1 mm long, inconspicuously bidentate with broad short teeth *C. interior*
- Beak 1/2 or more the length of the body, conspicuously bidentate, the teeth narrower *C. muricata*
- 3(1). Perigynia mostly 3.8–4.6 mm long, the beak sharp-margined and conspicuously serrulate; inflorescence 4–6.5 cm long *C. deweyana*
- Perigynia less than 3 mm long or, if longer, the inflorescence less than 3 cm long and the beak with mostly rounded margins, serrulate or not 4
- 4(3). Perigynia and scales black or dark brown at maturity; spikes in an ovoid head, 0.8–1.4 cm long, closely congested and not or but slightly evident without dissecting the head *C. illota*
- Perigynia greenish or light brown and/or the inflorescence more open with the spikes evident (Section Heleonastes in part) 5
- 5(4). Pistillate scales dark brown, equal to the body of the perigynium but often surpassed by the beak; perigynia 2.4–3.4 mm long; spikes 2–4, all approximate; plants rare, alpine on the Uinta Mts *C. bipartita*
- Pistillate scales greenish to dark brown, shorter than the body of the perigynium; perigynia 1.7–2.5 mm long; spikes 4–8, the lower ones sometimes separated, plants various 6
- 6(5). Lower spikes 4–8 mm long, equal or shorter than the internode of the rachis (to 8 times shorter), with 5–10 (15) perigynia *C. brunnescens*
- Lower spikes sometimes larger, usually equal to or longer than the internodes of the rachis, with (10) 15–32 perigynia 7

- 7(6). Pistillate scales brown to dark brown; perigynia slightly granular-roughened, not or sparingly serrulate distally, the dorsal suture encroaching onto the body; plants 10–31 cm tall *C. praeceptorum*
- Pistillate scales greenish or pale, occasional with very light brown markings; perigynia conspicuously granular-roughened and serrulate distally (at 20x or greater magnification), the dorsal suture evident only on the beak, if at all, plants 18–50 cm tall *C. canescens*

Key 4.

Spikes more than 1, sessile, gynaeandrous; stigmas 2; achenes lenticular; plants caespitose; perigynia winged, usually flattened (Section Ouales).

- 1. Bracts, at least the lowermost and sometimes 1 or more upper ones, as long as or longer than the inflorescence *C. athrostachya*
- Bracts lacking or shorter than the inflorescence or rarely equaling it 2
- 2(1). Pistillate scales as long and as wide as the perigynia; inflorescence (except in *C. araphoensis*), pale green to stramineous or light reddish brown, rarely bicolored and/or tending to be spicate with the internodes of the rachis evident; spikes 1–7 3
- Pistillate scales shorter and narrower than the perigynia; inflorescence variously colored but often dark brown to blackish or bicolored, with the perigynia lighter than the scales, tending to be capitate, with the internodes of the rachis concealed; spike number various 8
- 3(2). Perigynia 2.9–4.3 mm long, 1–1.5 mm wide; plants 11–28 cm tall, often of drying pools or ponds and lakes shores, known from the western Uinta Mts. *C. leporinella*
- Perigynia 4–8 mm long, 1.2–2.8 mm wide; plants of various stature and habitat, but often of drier places, the distribution various 4
- 4(3). Perigynium with a flattened, winged, serrulate, and often ill-defined beak; plants mostly of southern Utah 5
- Perigynium with a narrowly margined more or less distally terete beak, this serrulate in the proximal portion only; plants widespread 6
- 5(4). Inflorescence a compact head, the first 2 internodes collectively 1.5–6 mm long; plants mostly 15–30 (40) cm tall, commonly found above timberline *C. araphoensis*
- Inflorescence spicate, the first 2 internodes collectively (8) 10–18 mm long; plants commonly 30–70 cm tall, mostly found below timberline *C. xerantica*
- 6(4). Perigynia (5.7) 6–7.5 (8) mm long; plants lower montane to subalpine *C. petasata*
- Perigynia 4–6 mm long; plants of various habitats 7
- 7(6). Spikes all or mostly 2 or more times longer than the internodes of the rachis; inflorescence rather strict, 1.4–3 cm long; plants subalpine and more commonly alpine *C. phaeocephala*
- Spikes, at least the lower 2 or 3, only 1–2 times longer than the internodes of the rachis; inflorescence rather flexuous, sometimes over 3 cm long; plants lower montane to subalpine *C. praticola*
- 8(2). Perigynium with a flattened, winged, serrulate, often ill-defined beak 9
- Perigynium with a narrow, more or less terete beak, this not serrulate in the distal portion 13

- 9(8). Perigynia 2.3–3.7 mm long, 1–1.2 mm wide; plants known from wet places in Uintah County *C. bebbii*
- Perigynia 4.5–8 mm long, 1.6–3.5 mm wide, plants usually of well-drained soil, of various distribution . . . 10
- 10(9). Perigynia plano-convex; scales reddish brown with broad hyaline margins; plants of the Bear River and Uinta Mts. *C. multicostata*
- Perigynia strongly flattened except where distended by the achene; scales often brownish with green markings; plants of various distribution 11
- 11(10). Inflorescence spicate, the first 2 internodes collectively (8) 10–18 mm long; plants of southern and eastern Utah *C. xerantica*
- Inflorescence capitate, the first 2 internodes collectively only 4–7 (9) mm long; distribution various 12
- 12(11). Perigynia 2.5–3.5 mm wide, commonly over 5.6 mm long, up to 45 or more per spike; spikes 7–12 mm wide; anthers 2.5–3.7 mm long; plants (15) 30–90 cm tall, of rather broad distribution *C. eglestonii*
- Perigynia 1.6–2.5 mm wide, not over 5.6 mm long, to ca 20 per spike; spikes 5–7 mm wide; anthers 1.5–2 mm long; plants 24–45 cm tall, known from the central Wasatch and western Uinta mts. *C. straminiformis*
- 13(8). Perigynia 2.5–3.2 (3.5) mm long; inflorescence 0.7–1.8 cm long (or longer in *C. subfusca*) 14
- Perigynia 3.2–7.1 mm long; inflorescence sometimes longer 16
- 14(13). Perigynia sharp-edged but hardly wing-margined, not serrulate, 2.5–3 mm long; inflorescence 0.8–1.4 cm long, very dark brown to blackish; plants of wet places in the Uinta and central Wasatch mts. . . . *C. illota*
- Perigynia wing-margined, serrulate, 2.5–3.5 mm long; inflorescence and distribution various 15
- 15(14). Inflorescence 0.7–1.5 (1.8) cm long, compact head, the rachis obscured by the close spikes, which are scarcely evident except by dissecting the head; plants known from the northern half of Utah *C. limnophila*
- Inflorescence 1–3.5 cm long, capitate or spicate, the rachis internodes sometimes conspicuous, the spikes more or less evident without dissecting the inflorescence; plants known from southern Utah *C. subfusca*
- 16(13). Perigynia plano-convex, the perigynal cavity nearly filled by the plump achene; scales greenish, light brown or reddish brown; plants rather rare and somewhat restricted 17
- Perigynia strongly flattened except where distended by the relatively small achene, or else the scales dark brown to blackish; plants generally more common and widespread 19
- 17(16). Perigynia 2.7–3.2 (3.6) mm long; plants of Sevier, Washington, and Wayne counties *C. subfusca*
- Perigynia 3.5–6.2 mm long; plants known from the Uinta and Wasatch mts. 18
- 18(17). Pistillate scales equaling or slightly shorter than the appressed perigynia, at least some with broad, shining, white hyaline margins 0.1–0.3 mm wide, the scales scarcely shorter than the appressed perigynia *C. multicostata*
- Pistillate scales conspicuously shorter than the spreading perigynia, generally lacking white hyaline margins or these less than 0.1 mm wide *C. pachystachya*

- 19(16). Perigynia 5.2–7.1 mm long (at least some), 4–6.4 times longer than wide; spikes averaging over 10 mm long, the lower 1 or 2 regularly 11–13 (15) mm long, often elliptic, smooth, with the perigynia appressed; inflorescence often cuneate at the base *C. ebenea*
- Perigynia either shorter than above or else 1.6–4 times as long as wide; spikes averaging less than 10 mm long, the lower 1 or 2 typically less than 11 mm long, usually ovate, with the perigynia more or less spreading; inflorescence usually truncate at the base 20
- 20(19). Perigynia 1.3–2.3 mm wide, the body green or brownish in age, the beak often darker brown; scales brownish; inflorescence often conspicuously bicolored from the green or paler perigynia contrasting with the brownish scales *C. microptera*
- Perigynia (1.7) 2.2–2.8 mm wide, usually averaging over 2.2 mm wide, the body brown to dark brown, sometimes the winged margins greenish; scales brown to dark brown or blackish; inflorescence usually not conspicuously bicolored *C. haydeniana*

Key 5.

Spikes 3–5, the terminal one gynaeandrous, the lateral pistillate; pistillate scales very dark brownish purple to blackish; stigma very dark brownish purple to blackish; scales 3; achene trigonous (Section *Atratae* except *C. misandra* and *C. paupercula*).

- 1. Spikes sessile, congested into a head, the internodes of the rachis obsolete or at least very short and hidden by the closely aggregated heads 2
- Spikes sessile or peduncled, at least the lowest spike separated from the others by a conspicuous rachis internode 3
- 2(1). Perigynia 1.1–1.8 mm wide, usually somewhat inflated, without flattened margins or these generally not conspicuous, nearly filled by the mature achene, papillate at least apically (use 20x or greater magnification) *C. nelsonii*
- Perigynia 2–3 mm wide, strongly flattened with conspicuous broad margins, wider than the mature achene, more or less glossy on the faces, smooth or sometimes ciliolate apically *C. nota*
- 3(1). Lowest bract with a closed sheath 7–45 mm long; perigynia ciliolate-serrulate; spikes all on slender peduncles (Section *Ferrugineae*) *C. misandra*
- Lowest bract not sheathing or, if so, the sheath closed for less than 5 mm; perigynia glabrous or papillate; spikes various 4
- 4(3). Culms arising singly or few together from long creeping rhizomes, these covered with a yellowish feltlike tomentum; lateral spikes spreading or drooping, on slender peduncles; scales equaling or longer than the perigynia *C. paupercula*
- Culms tufted and rhizomes lacking or short or, if long, the spikes strongly ascending or erect or, if these spreading or drooping, the scales shorter than the perigynia 5
- 5(4). Pistillate scales aristate, the awn 1–2 mm long; culms arising singly or few together from long rhizomes; leaves all on the culms, the lower ones reduced to bladeless sheaths; plants rare, of wet places *C. buxbaumii*
- Pistillate scales acute to acuminate but not aristate; culms tufted; some leaves basal; plants various 6

- 6(5). Spikes not over 1.3 cm long; perigynia 2–2.8 mm long, green at maturity and strongly contrasting with the dark scales; intermediate spikes sessile or nearly so *C. norvegica*
- Spikes (at least the largest) commonly over 1.3 cm long and/or some of the perigynia over 2.8 mm long, these sometimes as dark as the scales at least distally or, if mostly green, the intermediate spikes commonly pedunculate 7
- 7(6). Upper spikes not particularly more crowded than the lower ones, all sessile or nearly so; inflorescence not over 1 cm wide; perigynia 1.9–3.6 mm long *C. parryana*
- Upper spikes generally more crowded than the lower ones or at least the lowest one commonly pedunculate; inflorescence sometimes over 1 cm wide; perigynia 2.7–5 mm long 8
- 8(7). Perigynia whitish green, rarely with red markings, strongly contrasting with the shorter, dark scales; lateral spikes ascending, spreading, or drooping at maturity, each usually on a slender peduncle, at least some in each inflorescence commonly gynaeceandrous *C. bella*
- Perigynia olive green or commonly marked with dark red, purple, or black, often about as dark as the scales distally; lateral spikes ascending to erect, the upper ones commonly sessile or short-pedunculate, all pistillate or infrequently gynaeceandrous in *C. atrata* 9
- 9(8). Perigynia 2.7–3.5 mm long, 1.6–2.1 mm wide, consistently papillate, sometimes completely black or black purple at maturity; lowest rachis internode 0.2–1 cm long; lowest spike sessile or on a peduncle to 0.3 cm long, the upper ones sessile or subsessile; plants 10–28 cm tall *C. albonigra*
- Perigynia mostly more than 3.5 mm long or over 2.1 mm wide, rarely papillate, sometimes greenish at maturity; lowest internode of the rachis ca 0.3–7 cm long; lowest spike sessile or on a peduncle to 4.5 cm long; plants (2) 2.5–10 dm tall *C. atrata*

Key 6.

Terminal spike staminate; stigmas 2; achenes lenticular; lateral spikes pedunculate and/or separated from the upper one.

- 1. Scales pale green; lowest peduncle enveloped at the base by a closed sheath 2–6 mm long, often originating near the base of the plant or on the lower 1/2 of the culm *C. aurea*
- Scales black or blackish purple, sometimes with a green or paler midstripe; lowest peduncle not in a sheath or, if so, the sheath less than 2 mm long, mostly on the upper 1/2 of the culm 2
- 2(1). Perigynia about as dark as the scales at maturity, slightly inflated; stigmas 2 or 3; style continuous with, persistent on, and of the same firm texture as the achene, strongly bent at maturity *C. saxatilis*
- Perigynia greenish or at least paler than and strongly contrasting with the dark scales, not inflated; stigmas 2; style jointed to, deciduous from, and of softer texture than the achene, straight (Section Acute) 3
- 3(2). Leaves 1–2.6 mm wide; plants caespitose, the larger roots covered with yellowish or yellow brown feltlike hairs; pistillate spikes 3–4 mm wide; perigynia rather conspicuously stipitate, soon deciduous after maturity *C. lenticularis*

- Leaves (at least some) over 2.6 mm wide or the perigynia nerved only on the margins; plants rhizomatous; fibrous roots lacking feltlike hairs or, if present, whitish; perigynia not or scarcely stipitate 4
- 4(3). Perigynia nerved on both sides and marginally, the beak (0.2) 0.4–0.6 mm long and bidentate and/or ciliate; midrib of scales conspicuous throughout and at least some excurrent as a mucro 0.5–1 (2) mm long; plants widespread *C. nebrascensis*
- Perigynia nerveless except marginally, the beak less than 0.3 mm long, entire or obliquely cleft, not ciliate; midrib of scales often inconspicuous toward the apex, not excurrent; plants low to high montane 5
- 5(4). Lowest bract shorter than the inflorescence; mature perigynia usually about as dark as the scales at least apically; pistillate spikes 5–10 mm wide; plants of the Deep Creek, Raft River, and Uinta mts. *C. scopulorum*
- Lowest bract usually exceeding the inflorescence; mature perigynia not so dark as the scales; pistillate spikes 3–5 mm wide; plants of the central and eastern part of Utah *C. aquatilis*

Key 7.

Terminal spike staminate; stigmas 3; achenes trigonous; the lower spikes peduncled and/or usually separated from the terminal one.

- 1. Perigynia pubescent 2
- Perigynia glabrous 7
- 2(1). Pistillate spikes with 1–4 perigynia, the lower ones arising near the culm base; plants 5–35 cm tall, densely caespitose, usually growing on dry or well-drained soil; staminate spikes 5–12 mm long *C. rossii*
- Pistillate spikes with more than 4 perigynia, arising from the upper half of the culm; plants often taller, caespitose or not, mostly of moist places; staminate spikes (at least some) over 12 mm long 3
- 3(2). Perigynia densely pubescent throughout; staminate spikes (1) 2–3 (4) 4
- Perigynia sparsely pubescent; staminate spike solitary 6
- 4(3). Leaf sheaths pubescent at least ventrally toward the summit; style continuous with and persistent on the achene; plants to be expected in northwestern Box Elder County *C. sheldonii* Mack.
- Leaf sheaths glabrous; style jointed with the achene, deciduous; plants of various distribution 5
- 5(4). Leaves involute or folded at least distally, often appearing terete, 1–1.5 (2) mm wide; plants of ponds and marshes on subalpine moraines in the eastern Uinta Mts. *C. lasiocarpa*
- Leaves flat or nearly so, the larger ones commonly 2–6 mm wide; plants widespread in the state *C. lanuginosa*
- 6(3). Pistillate spikes on slender peduncles, these ca 1/2 enveloped in the closed sheath of the subtending bract *C. luzulina*
- Pistillate spikes sessile or nearly so, the peduncles, if present, not enveloped in a closed sheath *C. parryana*
- 7(1). Style continuous with, persistent on, and of the same firm texture as the achene, not withering; staminate spikes more than 1 and/or usually 2.1–8.5 cm long 8
- Style jointed to, deciduous from, and of softer texture than the achene, withering; staminate spikes mostly 1, 0.3–2.1 cm long 13

- 8(7). Leaf sheaths pubescent; style straight; plants known from Sevier and Utah counties *C. atherodes*
- Leaf sheaths glabrous; style curved to strongly bent in age; plants of various distribution 9
- 9(8). Pistillate scales narrowed to a serrulate-elliptate awn *C. hystricina*
- Pistillate scales not awned (Section Vesicariae) 10
- 10(9). Pistillate scales soon purple black or black, except at the white hyaline acute tip; perigynia with the 2 marginal nerves evident; styles 2 and 3; achenes lenticular or trigonous *C. saxatilis*
- Scales green, stramineous, reddish brown or, if (rarely) dark brown, usually acuminate or caudate-acuminate; perigynia conspicuously nerved dorsally; styles 3; achenes trigonous 11
- 11(10). Inflorescence 5–13 cm long; spikes crowded, the pistillate ones longer than the rachis internodes; lowest bract 2–3 times longer than the inflorescence; perigynia 7–10 mm long; plants uncommon, known from Wasatch and Weber counties *C. retrorsa*
- Inflorescence commonly over 13 cm long; spikes not crowded, the pistillate one shorter to longer than the rachis internodes; lowest bract 1–2 times as long as the inflorescence; perigynia 4–7 mm long; plants of various distribution 12
- 12(11). Perigynia spreading at maturity, the ellipsoid to subglobose body more or less abruptly contracted to a conspicuous beak; plants with robust, long-creeping rhizomes, widespread, common *C. rostrata*
- Perigynia appressed or slightly ascending, the lanceolate to lance-ovate body gradually tapering to the often poorly defined beak; plants with rather short rhizomes, known from the Uinta Mts., uncommon *C. vesicaria*
- 13(7). Peduncle of the lowest and often the upper pistillate spikes enveloped in a closed sheath 0.4–2 (4) cm long or longer 14
- Peduncles not enveloped in a sheath or this closed for less than 0.4 cm 18
- 14(13). Plants with slender creeping rhizomes; lowest spike often borne on the lower half of the culm 15
- Plants caespitose; rhizomes lacking or very short; lowest spike usually borne on the upper half of the culm 16
- 15(14). Bracts not exceeding the inflorescence; stigmas 3; achenes trigonous; larger pistillate spikes commonly with over 20 perigynia; plants known from a marl bog in Kane County *C. crawei*
- Bracts (at least one) commonly exceeding the inflorescence; stigmas 2 (3); achenes lenticular; pistillate spikes with 4–18 perigynia; plants widespread *C. aurea*
- 16(14). Pistillate spikes 1–3 cm long; leaf blades 3–9 mm wide; perigynia 3–5 mm long *C. luzulina*
- Pistillate spikes 0.5–1.1 cm long; leaf blades 1–3 mm wide; perigynia 2.2–3.5 mm long 17
- 17(16). Pistillate spikes sessile or on erect or ascending peduncles, all crowded or the lowest one sometimes separate; inflorescence 2–5 (10) cm long; staminate spike 0.7–2.1 cm long *C. oederi*
- Pistillate spikes borne on capillary, spreading or drooping peduncles, remote; inflorescence 5–30 cm long; staminate spike 0.3–0.9 cm long *C. capillaris*
- 18(13). Pistillate spikes 4–6 mm long, sessile; perigynia widely spreading, greenish; scales greenish or pale; plants caespitose *C. interior*
- Pistillate spikes longer and/or at least one on a conspicuous peduncle; perigynia and/or scales brownish, blackish, or black purple 19
- 19(18). Pistillate spikes borne on slender, spreading to drooping peduncles; perigynia pale green; scales greenish brown to purple brown; culms arising singly or few together from long, creeping rhizomes; roots covered with a feltlike tomentum 20
- Pistillate spikes sessile or on erect peduncles or, if the lower peduncles spreading, the perigynia and/or the scales often blackish or black purple in part; culms tufted or arising singly or few together; roots not with a feltlike tomentum 21
- 20(19). Terminal spike 9–12 mm long, occasionally monoecious; lateral spikes often staminate at the base; leaves mostly with well-developed blades *C. paupercula*
- Terminal spike (10) 15–21 mm long, staminate; lateral spikes sometimes staminate at the apex; lower leaves usually bladeless *C. limosa*
- 21(19). Perigynia 1.9–3 (3.6) mm long; pistillate spikes 4–5 mm wide, commonly all sessile or nearly so *C. parryana*
- Perigynia (3) 3.3–5.2 mm long; pistillate spikes 5–8 mm wide, at least the lowest one commonly pedunculate 22
- 22(21). Perigynia green or olive green, strongly contrasting with the dark scales; plants uncommon in the Uinta Mts., more common elsewhere on well-drained soil, tufted, the rhizomes lacking or short *C. raynoldsii*
- Perigynia as dark, or nearly as dark, as the blackish or black purple scales; plants most common in the Uinta Mts., mostly of wet places, commonly rhizomatous 23
- 23(22). Perigynia slightly inflated, not flattened; leaf blades 1.5–3 mm wide; styles continuous with and persistent on the achene, contorted in age; stigmas 2 or 3; staminate spikes 1–2 (3); plants mostly of wet places *C. saxatilis*
- Perigynia flattened, not inflated; leaf blades 2–6 mm wide; styles jointed with, and deciduous from, the achene, straight; stigmas; staminate spikes solitary; plants commonly of well-drained soil *C. paysonii*

Carex albonigra Mack. in Rydb. White and Black Sedge. Plants (10) 15–28 cm tall, the culms tufted; rhizomes lacking or short; leaves basal and on the lower culms, the blades 1–5 mm wide, typically flat, the lower sheaths bladeless, often dark purple; lowest bract shorter than the inflorescence, this (1) 1.5–3 cm long, surpassing the leaves, the lowest internode 2–10 mm long; spikes 3 (2–4), 8–15 mm long, 3–6 mm wide, elliptic to narrowly ovate, the terminal gynacandrous, often a little larger than the lateral pistillate ones, the lowest one sessile or on a peduncle to 3 mm long, the others sessile or subsessile; pistillate scales subequal to or a shorter than the perigynia, black or blackish purple, with white hyaline margins, the midrib sometimes greenish or pale; perigynia 2.7–3.5 mm long, 1.6–2.1 mm wide, elliptic to nearly orbicular, papillate (at least apically), black or blackish purple throughout; stigmas 3; achenes trigonous, sessile or nearly so. High mountains, in fell fields, dry and wet meadows, and alpine tundra at 3430 to 3810 m in Duchesne, Grand, Juab, San Juan, Summit, Uintah, and Wasatch counties; Alaska and Mackenzie south to California and Arizona; 13 (ii). *Carex albonigra* appears to be allied to *C. atrata*, but it is consistently smaller, always of high elevations, and does not show the variation found in

C. atrata. The perigynia are always papillate but only occasionally and randomly papillate in *C. atrata*. Although apparently a distinct taxon, *C. albonigra* seems to pass into both *C. atrata* and *C. nova* (q.v.).

Carex aquatilis Wahl. Water Sedge. [*C. interimus* Maguire, type from Tony Grove Lake, Cache County]. Plants (0.6) 1.5–9.5 dm tall, from thick long rhizomes; culms tufted or arising singly or few together; leaves on the lower 1/2 of the culms, the blades 1.5–5.5 mm wide, shorter than to exceeding the culms; bracts leaflike, the lowest shorter than, subequal to, or surpassing the inflorescence, this 3–19 cm long, with 1–2 (3) staminate spikes above 2–3 (5) pistillate spikes, the transitional ones often androgynous; terminal staminate spike 1–3.5 cm long, the first lateral one 0.8–1.8 cm long, the second lateral or, if present, mostly larger than the first; pistillate spikes (0.7) 1.5–4.5 (7) cm long, 3–5 mm wide; pistillate scales blackish or black purple, shorter to longer and narrower than the perigynia, lanceolate to ovate, acute to acuminate or rather rounded at the tip, entire, the midrib green or pale or colored like the scale, not raised or excurrent; perigynia numerous, 2–3.3 mm long including the beak, elliptic to obovate, more or less strongly flattened, marginally nerved only, light green or stramineous in age, often speckled or suffused with reddish brown, minutely granular-muricate, the beak 0.1–0.3 mm, entire or oblique but not bidentate or ciliolate; stigmas 2; achenes lenticular, shorter and usually narrower than the perigynia; $2n = 76$. Wet and boggy meadows, along streams, and margins of ponds and lakes at 2195 to 3475 m in Beaver, Cache, Daggett, Duchesne, Emery, Garfield, Grand, Iron, Kane, Salt Lake, San Juan, Sanpete, Sevier, Summit, Uintah, Utah, Wasatch, Washington, and Wayne counties; circumboreal, south in North America to California and New Jersey; 82 (xv). Our members of section *Acutae* are not easily distinguished. The primary distinction (ribs of the perigynia) between *C. aquatilis* and *C. nebrascensis* (q.v.) hardly seems to warrant segregation at the specific level. However, this feature is correlated with other morphological and with ecological trends. The distinction between *C. aquatilis* and *C. scopulorum* (q.v.) seems to be tenuous, but the taxa have quite different ranges. The separation from *C. lenticularis* (q.v.) is real but difficult. *Carex bigelowii* Torr. has been reported for Utah. Plants of that taxon have narrow spikes similar to those of *C. aquatilis* but have the lowest bract shorter than the inflorescence as in those of *C. scopulorum*. Occasional specimens with slender spikes and lowest bract shorter than the inflorescence occur sporadically in Utah within the range of *C. aquatilis*. The significance of such plants in Utah is not clear and they are referred here to *C. aquatilis*.

Carex arapahoensis Clokey Arapaho Sedge. Plants 12–30 cm tall, densely caespitose; rhizomes lacking or very short; leaves basal and on the lower culms, the blades 1.5–4 mm wide, flat or nearly so; lowest bract lacking; inflorescence 1–2 cm long, headlike, equaling or surpassing the leaves, the lowest internode of the rachis ca 2–6 mm long; spikes usually 3–6, gynaeandrous, 8–12 mm long, sessile, closely aggregated but more or less evident; pistillate scales equaling or longer than and as wide or wider than the perigynia, brown, with a pale midrib and hyaline margins; perigynia 4.5–5.5 mm long, 2–2.5 mm wide, more or less elliptic to ovate or elliptic-obovate, flattened, with thin winged margins, the wing

extending onto the beak, serrulate at least in the distal 1/4–1/2, finely nerved on both sides, dark reddish brown; stigmas 2; achenes lenticular. Alpine communities of the La Sal Mts. at 3660 to 3960 m in Grand and San Juan counties; Wyoming and Colorado; 2 (0).

Carex atherodes Sprengel Awned Sedge. Plants 4–15 dm tall; culms arising singly or few together from robust, creeping rhizomes; leaves distributed along the culms, the sheaths villous-hirsute, or sometimes pubescent only toward the ventral summit, the blades 4–12 mm wide; inflorescence to 45 cm long with well-spaced spikes mostly shorter than the internodes or the upper ones longer; upper 2–4 spikes staminate, 2.5–5 cm long, sessile or nearly so, except the terminal on a peduncle to 3 cm long; lower spikes pistillate or the intermediate ones sometimes androgynous, cylindrical, 5.5–9 cm long, ca 10 mm wide, on peduncles 1–11 cm long, the lower ones enveloped in a closed sheath up to ca 9 cm long; pistillate scales aristate-awned, the awn 1–5 mm long and subequal to the perigynia, the body pale, rather scarious, narrower than the perigynia; perigynia 7–10 mm long, lanceolate or lance-ovate, inflated below, conspicuously ribbed, ascending, with a bidentate beak, the teeth 1.5–3 mm long and often more or less divergent; stigmas 3; achenes trigonous; style continuous with, persistent on, and of the same firm texture as the achene, more or less contorted in age; $2n = 74$. Margins of ponds and lakes, and along streams, at 1370 to 2695 m in Sevier and Utah counties; circumboreal, south in America to New York, Colorado, and Oregon; 1 (0).

Carex athrostachya Olney Slender-beaked Sedge. [*C. macloviana* var. *pachystachya* f. *involutrata* Kuenthal in Engl.] Plants 10–52 cm tall, densely caespitose; rhizomes lacking or very short; leaves basal and on the lower culms, the blades 1–3 mm wide, flat or channeled; lowest bract (at least) subequal to or surpassing the inflorescence, but not uncommonly shorter, or broken and appearing shorter; inflorescence 1–2.5 cm long, 8–15 mm wide, headlike, usually exerted beyond the leaves, the lowest internode 1–3.5 mm long; spikes ca 3–15, gynaeandrous, 5–10 mm long, ca 5 mm wide, sessile, tightly aggregated, much longer than and concealing the internodes of the rachis, not, or hardly, evident without dissecting the inflorescence or the lower ones conspicuous; pistillate scales subequal to and almost as wide as the perigynia, brown with a green or pale midstripe and with or without narrow hyaline margins; perigynia 3.5–4.5 mm long, 1–1.5 mm wide, lanceolate or narrowly ovate, flattened, with winged margins, slightly nerved dorsally and sometimes ventrally, greenish, serrulate at least in the distal 1/2, tapered into a more or less terete, often brownish beak; stigmas 2; achenes lenticular. Drying mud of ephemeral pools, margins of ponds and lakes, and lodgepole pine, aspen-spruce, forb-grass, and wet meadow communities at 1825 to 3475 m in Beaver, Cache, Daggett, Duchesne, Emery, Garfield, Kane, Salt Lake, Sanpete, Sevier, Summit, Uintah, Utah, Wasatch, Washington and Weber counties; Alaska to Saskatchewan, south to California and Colorado; 35 (x).

Carex atrata L. Blackened Sedge. [*C. heteroneura* W. Boott]. Plants 2.5–10 dm tall; culms tufted; rhizomes lacking or short; leaves basal and on the lower culms, the blades 1.5–10 mm wide, flat; lowest bract often foliose, mostly subequal to or shorter than the inflorescence, this 2–10 cm long; first internode of the rachis (0.5) 1–7 cm

long or almost obsolete, shorter than to surpassing the spike; second internode ca 1–8 mm long; spikes 3–5, 0.8–2.5 cm long, 4–8 mm wide, narrowly oblong to linear, the terminal one gynaeandrous, the lateral ones pistillate or infrequently gynaeandrous, the lowest one typically on a peduncle to 4.5 cm long, the upper pedunculate or sessile; pistillate scales shorter than to much longer than the perigynia, blackish, dark brownish purple, or blackish purple; perigynia 3–5 mm long, 1.7–4 mm wide, oblong, ovate, or nearly orbicular, olive green, yellow brown, or greenish marginally but often suffused with dark purple or purple black; stigmas 3; achenes trigonous, commonly short-stipitate; $2n = 54$. There are three varieties in Utah.

1. Perigynia not flattened, lanceolate or narrowly elliptic, olive green, becoming yellow brown at maturity, seldom suffused with dark color, except for the beak, not much wider than the mature achene; plants rare in Duchesne County *C. atrata* var. *atrosquama*
- Perigynia flattened, broadly elliptic to ovate or obovate, mostly conspicuously suffused with dark purple or black, wider than the mature achene; plants widespread 2
- 2(1). Pistillate scales equal to or longer than the perigynia, plants mostly of the southern half of the state, but also of the Wasatch Mts. *C. atrata* var. *chalciolepis*
- Pistillate scales equal to or shorter than the perigynia; plants rather widely distributed *C. atrata* var. *erecta*

Var. *atrosquama* (Mack.) Kelso [*C. atosquama* Mack.]. Engelmann spruce woods and openings and alpine communities at 2800 to 3370 m in the Uinta Mts. in Duchesne County; British Columbia and Montana south to Colorado; 6 (vi). Unlike the following two varieties this seems to be a well marked taxon.

Var. *chalciolepis* (H. T. Holm) Kukenthal [*C. chalciolepis* H. T. Holm]. Oak-ponderosa pine-fir, aspen, spruce-fir, and alpine communities at 2470 to 3660 m in Beaver, Duchesne (Harrison 7705A), Grand, Iron, Salt Lake, San Juan, Utah, and Wayne counties; Wyoming, Colorado, Utah, and Arizona; 37 (x).

Var. *erecta* W. Boott [*C. epapillosa* Mack. in Rydb, type from Piute County; *C. heteroneura* var. *epapillosa* F. Hermann]. Lodgepole pine, spruce-fir, moist meadow, and alpine communities, sometimes in talus or boulder fields, at 2285 to 3870 m in Cache, Daggett, Duchesne, Emery, Juab, Rich, Salt Lake, Sevier, Summit, Tooele, Uintah, Wasatch, and Washington counties; Washington to California, east to Montana and Utah; 55 (vi). Our plants show a continuum in the relative length of the scales, and to segregate all Utah specimens of var. *erecta* and var. *chalciolepis* becomes an exercise in futility. However the trends in morphology, as well as geography, seem sufficient to maintain a distinction at varietal level. The shape of the perigynia and length of the peduncles are features that have been used to distinguish these two taxa, but these are poorly if at all correlated with the length of the scales. Random plants from throughout the range of the species in Utah have glabrous and granular-roughened perigynia (at least on the margins toward the beak), but this feature appears to have no taxonomic merit.

Carex aurea Nutt. Golden sedge. [*C. garberi* Fern.; *C. hassei* Bailey]. Plants 4–40 (65) cm tall; culms tufted or arising singly or few together from slender pale rhizomes;

leaves borne on the lower culms, the blades 1–4 mm wide, flat, surpassing or shorter than the bracteate inflorescence; bracts leaflike, with sheathing bases, some usually equaling or exceeding the inflorescence, the lowest with a closed sheath 2–6 mm long or longer; terminal spike staminate or often gynaeandrous, rarely androgynous, 0.4–1.5 (2) cm long, 2–3 mm wide, with peduncles 0.4–2 cm long; lateral spikelets 1–3 (4), pistillate, 0.5–2.5 cm long, 3–5 mm wide, usually well spaced and pedunculate; peduncles filiform or capillary, commonly 0.3–7 cm long, or the lowest one arising at or near the culm base and to 11 cm long, this often enclosed in a long sheath; pistillate scales greenish or brown with a green or pale center, shorter than the perigynia; perigynia 4–18, 1.7–3 mm long, ellipsoid to obovoid-globose, pale green and whitish papillate when young, sometimes turning golden and somewhat fleshy in age; stigmas 2, rarely 3 in some perigynia; achenes lenticular; $2n = 52$. Around seeps and springs, along streams, wet meadows, and hanging gardens at 1140 to 3350 m in all Utah counties except Box Elder, Carbon, Davis, Morgan, Wayne, and Weber; Alaska to Newfoundland southward to New Mexico and Pennsylvania; 75 (vii). Tall specimens from the canyonlands section of Utah are similar in appearance to *C. aquatilis*. Such specimens might be referred to *C. hassei*. However, the numerous specimens seen show a continuum in size from very small to quite large, and the color (golden versus green) of the perigynia seems poorly if at all correlated with any other feature. Our plants are probably no more than a subspecies of *C. bicolor* All. of Eurasia and Alaska, but no combination is proposed here.

Carex backii F. Boott in Hook. [*C. saximontana* Mack.]. Plants ca 15–30 cm tall, densely caespitose, without rhizomes; culms slender, becoming capillary, or toward the base shorter than the leaves; leaves mostly basal, the blades 2–6 mm wide, flat; inflorescence less than 1 cm long, terminal and basal or nearly so, the terminal one with 2 or 3 spikes subtended (and greatly exceeded) by a leaflike bract, the basal ones of a solitary spike and bractless but with the scales bracteate; spikes androgynous but with the staminate part short, inconspicuous, and exceeded by the upper perigynia, sessile or nearly so; upper pistillate scales shorter than the perigynia, the lower ones bracteate and surpassing the perigynia, 1–7 cm long; perigynia 4–5.4 mm long, green or greenish, inconspicuously nerved, rhombic-ovoid and obscurely beaked or subglobose and conspicuously beaked; stigmas 3; achenes rounded-trigonous, ca 3 mm long; $2n = 64, 66$. Oak-maple communities at 1720 to 1980 m in Cache, Daggett, Juab, Salt Lake, and Utah counties; British Columbia to Quebec and south to Oregon and New York; 2 (0).

Carex bebbii Olney ex Fern. Plants 3–7 dm tall, densely tufted; rhizomes lacking; leaves borne on the lower culms, the lowermost reduced to bladeless sheaths or with short blades, the upper ones with blades 2–4 mm wide; lowest bract lacking; inflorescence 1–3 cm long, 5–12 mm wide, leaflike, subequal to or surpassing the leaves, the lowest internode of the rachis 3–4 mm long; spikes usually 4–12, gynaeandrous, 5–9 mm long, sessile, closely aggregated but more or less evident without dissecting the inflorescence, equal to or to 3 times as long as the rachis internodes; pistillate scales shorter and narrower than the perigynia, stramineous to light brown, with a greenish or pale midrib, the margins hyaline or not;

perigynia 2.3–3.7 mm long, 1–1.2 mm wide, pale green to stramineous or tan, flattened, with thin winged margins, the wings extending to near the ill-defined, flattened beak apex, densely crowded in the spike and spreading-ascending, serrulate; stigmas 2; achenes lenticular; $2n = 68$. Riparian communities, margins of beaver ponds, and along ditches at 1800 to 2225 m in Uintah County (White-rocks drainage); British Columbia to Newfoundland and south to Oregon and New Jersey, and Colorado; 4 (iv).

Carex bella Bailey Beautiful Sedge. Plants 20–68 cm tall, tufted, rhizomes lacking or short; leaves basal and on the lower culms, the blades 1–5 mm wide, flat; lower bract usually leaflike, typically shorter than or subequal to the inflorescence, or infrequently to 2.5 cm longer than the inflorescence, with a sheathing base ca 3–4 mm long, the scarious margins of the sheath free or nearly so; inflorescence somewhat flexuous and tending to nod, 4–7 cm long or longer; spikes (2) 3–4, commonly gynaeandrous, pedunculate, more or less cylindrical, 1–3.2 cm long, 3–6 mm wide, the uppermost usually with a conspicuous but short staminate portion, subsessile to peduncled; the lateral ones usually with only a few stamens and infrequently all pistillate; peduncles slender flexuous, the lower ones shorter to longer than the spikes, the lowest one rarely arising near the base of the culm; pistillate scales shorter than the perigynia, blackish or black purple, the pale midrib obscure or slightly keeled, especially apically and sometimes excurrent as a mucro; perigynia 2.8–4 mm long, broadly oval to oblong-oval, flat but swollen by the ripening achene, green and strongly contrasting with the dark scales; stigmas 3; achenes trigonous. Ponderosa pine-oak, aspen, and more commonly lodgepole pine, spruce, and fir communities and openings, and alpine slopes at 2650 to 3340 m in Beaver, Carbon, Daggett, Duchesne, Emery, Garfield, Grand, Iron, Piute, San Juan, Sevier, Summit, Uintah, and Wayne counties; Colorado and South Dakota, south to Arizona, New Mexico, and Mexico; 44 (x).

Carex bipartita All. Plants 5–20 cm tall, tufted; rhizomes lacking or short; leaves basal and on the lower culms, the blades 0.5–2 mm wide; lowest bract lacking or shorter than the first spike; inflorescence 1–1.5 cm long, 0.5–1 cm wide, surpassing the leaves; spikes 2–4, gynaeandrous, 0.5–1 cm long, 3–5 mm wide, sessile, approximate, longer than the internodes of the rachis, but evident in the inflorescence; pistillate scales subequal to and as wide as the perigynia, largely concealing them, except for the beak, brown to blackish purple brown, with hyaline margins and usually a pale midstripe; perigynia 2.4–3.4 mm long, elliptic to obovate, more or less concavely tapered to a short beak to 0.7 mm long, the dorsal suture extending from the beak to the distal portion of the body, more or less flattened but with rounded margins, finely several-nerved on each side, yellow green or brown green with the nerves often brown red, finely granular-roughened, ascending, ca 10–30 per spike; stigmas 2; achenes lenticular. Wet alpine meadows at 3370 m in the Uinta Mts., Summit County; circumboreal, south in the U. S. to Colorado; 4 (i). With brownish scales, reddish nerved perigynia, approximate spikes, and alpine habitat, the plants of *C. bipartita* are more like those *C. praeceptorum* than they are to those of *C. canescens* or *C. brunescens*.

Carex breweri F. Boott [*C. engelmannii* Bailey]. Plants 5–30 cm tall; culms arising singly or few together from

creeping rhizomes; leaves basal and on the lower culms, the blades ca 1 mm wide, involute or deeply channeled, more or less wiry like the culms; bract lacking; spike solitary, erect, androgynous, 1–2 cm long, 6–12 mm wide, 1.2–2.5 times as long as wide, more or less shiny, ellipsoid or ovoid, the staminate portion rather inconspicuous; scales brownish or dark brown, the pistillate ones subequal to the perigynia; perigynia numerous, 4–7.5 mm long, 1.8–4.5 mm wide, ovate or broadly elliptic, very thin walled, abruptly or gradually short-beaked; rachilla ca 1/2 to as long as the achene; stigmas 3; achenes trigonous, only 1/4–1/2 as long and as wide as the perigynia. Wet or dry places, sometimes among limestone rocks or talus, at 3050 to 3350 m in Cache, Duchesne, and Salt Lake counties; British Columbia to California, east to Wyoming and Colorado; 4 (i). Our plants have a single nerve on the pistillate scales and are referred to *var. paddoensis* (Suksd.) Cronq. [*C. paddoensis* Suksd.].

Carex brunescens (Pers.) Poir. in Lam. Brownish Sedge. Plants (1) 2–6 dm tall, tufted; rhizomes lacking or short; leaves basal and on the lower culms, the blades 1–2.5 mm wide; lowest bract inconspicuous or awned and surpassing the lowest spike but not the inflorescence, this 1–3.5 cm long, ca 4–6 mm wide, usually surpassing the leaves, spikelike, typically interrupted; spikes 4–9, gynaeandrous, 4–8 mm long, ca 3 mm wide, sessile, approximate and longer than the internodes or more often the lower ones widely remote and only 1/8–1/3 as long as the internodes; lowest internode sometimes to 2.5 (4) cm long; pistillate scales usually much shorter than the perigynia, mostly scarious, except for the green or rarely brownish midstripe; perigynia 1.7–2.5 mm long, elliptic or elliptic-ovate, more or less compressed but with rounded (not winged) margins, finely nerved on both sides or nearly nerveless ventrally, green or brownish distally in age, ca 5–10 (15) per spike, usually slightly spreading, so that the beaks interrupt the outline of the spike; dorsal suture extending from the beak onto the body, this often with a narrow hyaline overlapping flap; stigmas 2; achenes lenticular; $n = 27, 28$. Wet meadows and other wet places at 2225 to 2956 m in the Uinta Mts., Summit and Uintah counties; circumboreal, south in America to Oregon and Tennessee; 2 (i). This taxon is obviously related to *C. canescens* and *C. praeceptorum*, but the culms are more lax and other features of the spikes and perigynia are quite different.

Carex huxbaumii Wahl. Plants 3–5.5 dm tall, the culms arising singly or 2 or 3 together and well spaced on long creeping rhizomes; leaves all cauline, borne on the lower culms, the lower ones reduced to bladeless sheaths, the blades 1–3 mm wide; lowest bract leaflike, shorter than to exceeding the inflorescence by 2 cm; inflorescence 3.5–6.5 cm long, mostly surpassing the leaves; spikes 3–4, 0.7–2.2 cm long, 4–8 mm wide, ovoid to nearly cylindrical, erect or strongly ascending, the terminal one gynaeandrous, longer than its peduncle, the lower ones pistillate, sessile or longer than their peduncles, each slightly shorter or exceeding the internode it subtends; pistillate scales conspicuously aristate, the awn-point ca 1–2 mm long, the body usually shorter than the perigynia, but with the awn exceeding it, brownish purple or blackish purple, with a greenish midrib; perigynia 2.5–4 mm long, elliptic or elliptic-obovate, faintly nerved; stigmas 3; achenes trigonous. Wet and boggy meadows and seeps at 2255 to 2900 m in the Uinta Mts.,

Daggett, Duchesne, Summit, and Uintah counties; circumboreal, south in America to North Carolina and California; 5 (iv).

Carex canescens L. Pale Sedge. [*C. canescens* var. *dubia* Bailey, type from Bear River Canyon, Summit County]. Plants 18–50 cm tall, densely caespitose; rhizomes lacking or very short; leaves basal and on the lower culms, the blades 1.5–3.1 mm wide; lowest bract lacking or mostly shorter than the first spike and never exceeding the second one; inflorescence 1.4–5.2 cm long, 0.5–1 cm wide, spikelike, equaling or surpassing the leaves; spikes 4–8, androgynous, 0.5–1.4 cm long, 2.5–5 mm wide, sessile, more or less cylindrical, greenish or silver, approximate or the lower ones spaced, equal to or longer than the internodes or the lowermost rarely shorter; pistillate scales usually conspicuously shorter than the perigynia, pale green or silvery, mostly hyaline except for the green midstripe, sometimes pale brown in age; perigynia 1.8–2.5 mm long, 1–1.2 mm wide, elliptic to elliptic-ovate, more or less compressed but with rounded (wingless) margins, greenish, yellow green, or grayish green, sometimes brownish toward the beak, finely nerved on both sides, the nerves green or rarely pale brown, (10) 15–32 per spike, quite noticeably granular-roughened distally, very short-beaked, the beak granular-roughened and often serrulate (use high magnification), the dorsal suture evident only on the beak, if at all; stigmas 2; achenes lenticular; $n = 28, 36$. Wet and boggy meadows, and on the margins of ponds and lakes, streams, and seeps and springs at 1920 to 3475 m in Beaver, Daggett, Duchesne, Emery, Garfield, Piute, Salt Lake, San Juan, Sevier, Summit, and Uintah counties; circumboreal, south in America to California and Virginia; 29 (xi).

Carex capillaris L. Hair Sedge. Plants 5–70 cm tall, densely caespitose from short rhizomes; culms slender, rather weak; leaves basal and on the lower culms, or 1 above the middle, the blades 1–3 mm wide; lowest bract foliose, shorter than the inflorescence, strongly sheathing, the sheath closed for 9–20 mm; inflorescence 5–30 cm long, surpassing the leaves; terminal spike staminate, rarely gynaeandrous, 3–9 mm long, borne on a capillary peduncle 1–5 cm long; lateral spikes pistillate, 6–11 mm long, with 5–25 perigynia, borne on capillary, spreading to drooping peduncles to 3.5 cm long, each peduncle enveloped basally by the closed sheath of the subtending bract, the lowest spike and peduncle together much shorter than the accompanying internode of the rachis; pistillate scales $1/2$ – $3/4$ as long as the perigynia, with broad hyaline margins and greenish centers or greenish midstripe flanked by light reddish brown stripes; perigynia 2.4–3.3 mm long, more or less elliptic or lance-ovate, more or less rounded, the marginal nerves rather prominent, green at first, turning a glossy brown; stigmas 3; achenes trigonous, not filling the distal part of the perigynia; $2n = 50?$, 52, 54. Wet meadows and along streams at 2440 to 2835 m in Cache, Beaver, Daggett, Duchesne, Iron, Juab, Uintah, and Utah counties; circumboreal, south in America to New Mexico and New York; 16 (iv).

Carex capitata L. Capitata Sedge. Plants 5–20 cm tall; culms closely spaced on short rhizomes; leaves borne on the lower $1/4$ of the culms, the lower ones often reduced to bladeless sheaths, the upper ones with blades to ca 1 mm wide, involute, filiform; bract lacking; spike solitary, erect, androgynous, 4–10 mm long, ca 3–7 mm wide, the staminate part short or elongate; pistillate scales shorter

and narrower than the perigynia, dark brown with broad hyaline margins; perigynia 6–25, 2–3.5 mm long, ovate to suborbicular, conspicuously beaked; rachilla about reaching the beak of the perigynium; stigmas 3; achenes trigonous, not filling the perigynia; $2n = 50$. Moist or dry alpine tundra of the Uinta Mts., Duchesne County; British Columbia and Alberta south to California and Colorado, and reputedly to South America; 2 (0).

Carex crawei Dewey Plants 1–3 dm tall; culms arising singly or few together from creeping rhizomes; leaves borne toward the base of the culms, the blades 1.5–3 mm wide; inflorescence 4–18 cm long with the spikes well-spaced and shorter than the internodes, the lowest spike sometimes borne near the base of the culm; terminal spike staminate, 1.2–2 cm long; lateral spikes pistillate, 1–2 cm long, on peduncles 0.2–4.2 cm long, these short above, longer below, each enclosed in the sheath of the subtending bract, the closed sheath 2–25 mm long, the bracts shorter than the inflorescence; pistillate scales shorter than the perigynia, with a greenish or pale, more or less 3-nerved, narrow, triangular midstripe and scarious but brownish or brown purple margins; perigynia (5) 10–15, 2.3–3.8 mm long, elliptic or ovate, greenish to straw colored or light brown, inconspicuously beaked, faintly many-nerved; stigmas 3; achenes trigonous, loosely filling the lower part of the perigynia; $2n = 38$. The one specimen seen (Maguire 18828) is from a marl bog at ca 2680 m in Kane County; British Columbia to Quebec and south to Missouri; 1 (0).

Carex curatorum Stacey Canyonlands Sedge. [*C. scirpoidea* var. *curatorum* (Stacey) Cronq.]. Plants 21–40 cm tall, dioecious, densely caespitose, without rhizomes or these very short; leaves basal and on the lower culms; blades 1–4 mm wide; bract mostly lacking or rarely to 1.5 cm long; spike solitary, erect or nearly so, 1.8–4.5 cm long, ca 5 mm thick; scales reddish brown with a pale midstripe and hyaline margins, often ciliate, somewhat erose, sparsely pubescent dorsally, the pistillate ones shorter and narrower than the perigynia, these 3.2–4 mm long, broadly elliptic, obovate to nearly orbicular, blackish purple distally, greenish below, conspicuously pubescent with translucent hairs; stigmas 3; achenes trigonous. Hanging gardens and canyons along the Colorado and San Juan rivers at 1155 to 1340 m in Kane and San Juan counties; northern Arizona; 7 (0). Some plants of *C. scirpoidea* from Emery (Scad Valley), Garfield, and Iron counties are very close to this taxon, and possibly should be placed here.

Carex deweyana Schwein. [*C. bolanderi* Olney]. Plants 40–75 cm tall, tufted; rhizomes lacking or short; leaves borne on the lower culms, the blades 1–3 mm wide, flat; lowest bract lacking or present and shorter than or subequal to the inflorescence, this 4–6.5 cm long, ca 5–10 mm wide, spikelike, equaling the leaves or surpassing them; spikes 4–6 (10), gynaeandrous, 0.7–1.6 cm long, ca 4–6 mm wide, pale green, sessile, the lowest usually remote, subequal to or to 2.5 times shorter than the internode, the upper ones remote or approximate but individually evident without dissecting the inflorescence, the staminate flowers few, their scales rather closely appressed to a pedunclelike portion of the rachis; pistillate scales as long as the body of the perigynia, pale green or slightly stramineous, often largely hyaline, with a darker green midrib, this sometimes excurrent; perigynia 3.8–4.6 mm long, 1–1.2 mm wide, lanceolate to lance-el-

liptic, pale green, the margins not winged or scarcely so distally, the marginal nerves prominent, raised, sometimes slightly extended onto the ventral surface, the dorsal ribs conspicuous, the ventral lacking or obscure, the body tapering to a serrulate bidentate beak with teeth to 0.4 mm long; stigmas 2; achenes lenticular, 1.5–2 mm long; $2n = 54$. Oak, aspen, and white fir communities, mostly along streams, at 2195 to 2950 m in Cache, Juab, Millard, Piute, and Salt Lake counties (Deep Creek, Canyon, and Wasatch mts.); British Columbia to Newfoundland and south to California and Pennsylvania; Asia; 5 (ii). Utah materials are more or less referable to *var. bolanderi* (Olney) W. Boott [*C. bolanderi* ssp. *leptopoda* (Mack.) Calder & Taylor].

Carex diandra Schrank Lesser Panicle Sedge. Plants 3–10 dm tall; caespitose with short rhizomes; leaves borne on the lower culm, the lowermost reduced to bladeless sheaths, the upper with elongate blades 1–2.5 (3) mm wide, these subequal to or surpassing the inflorescence, flat or nearly so; inflorescence 1–6 cm long, 7–10 mm wide, compound but headlike or spikelike; spikes crowded, scarcely evident, ca 3–5 mm long, few-flowered, androgynous; pistillate scales rather hyaline, brownish or stramineous, the midrib firmer and sometimes projected as an aristate awn; perigynia 2.4–3 mm long, lance-ovate or lance-truncate, short-stipitate, abruptly to gradually tapered to a serrulate beak, the dorsal suture sometimes extended into a membranous flap or keel, this usually conspicuous toward the apex, the body thick-walled, dark brown, shiny; stigmas 2; achenes lenticular. Wet meadows and sphagnum bogs, rare, at ca 2285 m in Duchesne and Garfield (Intermountain Flora report) counties; circumboreal, south in America to California and Pennsylvania; 1 (i). Possibly reports of the closely related *C. cusickii* Mack. in Piper & Beattie for Utah are based on specimens of *C. diandra*.

Carex dioica L. Yellow Bog Sedge. [*C. gynocrates* Wormsk.]. Plants 2–20 cm tall, culms arising singly from long, very slender rhizomes, these to ca 0.5 mm thick; leaves borne on the lower culms, the blades 0.4–0.9 mm wide, narrowly involute; bract lacking; spike solitary, androgynous or nearly all staminate to nearly all pistillate, 1–1.5 cm long, the staminate part only 1–2 mm wide; pistillate scales usually shorter but broader than the perigynia, light brown, persistent; perigynia 3–3.5 mm long, plump, prominently ribbed dorsally, strongly spreading to descending, commonly chestnut brown at maturity, thick-walled, spongy at the base (especially ventrally), abruptly contracted to a short beak; rachilla obsolete; stigmas 2; achenes lenticular, filling the perigynial cavity; $2n = 48, 50, 70$. Wet and boggy meadows at 2740 to 3130 m in Daggett, Duchesne, Emery, Garfield, Iron, Summit, and Uintah counties; circumboreal, south in America to Oregon, Colorado, and Pennsylvania; 10 (vii). Our materials are referable to *var. gynocrates* (Wormsk.) Ostenf.

Carex disperma Dewey Softleaved Sedge. Culms 10–45 cm long, densely tufted, from short slender rhizomes, rather flaccid or flexuous; leaves basal and on the lower culms, the blades 0.5–2 mm wide; inflorescence 0.8–4 cm long, 3–5 mm wide, usually interrupted, spike-like, sometimes subtended by a narrow bract, this shorter than the inflorescence; spikes sessile, 3–5, to ca 5 mm long, about as wide as long, androgynous, with 1 or 2 (3) staminate flowers and 1–3 perigynia, the staminate flow-

ers inconspicuous and the spikes sometimes appearing pistillate; pistillate scales shorter than to equaling the perigynia, pale green, scarious; perigynia 2–3 mm long, elliptic, abruptly contracted to a very short beak; stigmas 2; achenes lenticular, filling the perigynium; style semipersistent on the achene; $2n = 70$. Wet and boggy meadows and along streams, mostly in shade of woods, at 2285 to 3050 m in Beaver, Cache, Daggett, Duchesne, Garfield, Grand, Juab, Piute, Salt Lake, San Juan, Sanpete, Summit, Uintah, Utah, Wasatch, Washington, and Wayne counties; circumboreal, south in America to New Mexico and New Jersey; 34 (xv).

Carex douglasii F. Boott in Hook. Plants 8–28 cm tall, mostly dioecious; culms arising singly or few together from long slender brownish rhizomes less than 2 mm in diameter; leaves basal and on the lower culms, the blades 0.5–2 mm wide; lowest bract lacking or sometimes present and foliose; inflorescence 1.5–5.5 cm long, (5) 10–20 mm wide, headlike, exceeded by the leaves or surpassing them; spikes ca 10–25, generally all staminate or all pistillate, rarely androgynous, densely crowded, over twice as long as the internodes of the rachis, more or less evident without dissecting the head or the upper ones sometimes not, the lower 0.8–2 cm long, ovoid or more commonly the larger ones elongate and nearly linear or linear-elliptic; pistillate scales longer than the perigynia and concealing them, these and usually the staminate ones with a sometimes excurrent, light green midstripe, this flanked on both sides by a narrow stramineous or pale brown stripe and then the broad hyaline margins, very conspicuous in the spikes; perigynia 2.2–4.7 mm long, 1.1–1.8 mm wide, ovate to elliptic, brownish, the marginal nerves prominent and distended toward the ventral surface, otherwise obscurely nerved; beak of the perigynium 1–1.5 mm long, obliquely cleft, often hyaline, the dorsal suture often conspicuous and with a hyaline flap, this sometimes encroaching onto the body of the perigynium; stigmas 2; achenes lenticular; $2n = 60$. Pinyon-juniper, sagebrush-grass, mountain brush, lodgepole pine, and spruce-fir communities, often along roads and near seeps and springs where trampling of livestock has compacted the soil, at 1525 to 3110 m in all Utah counties except Carbon, Davis, Grand, Kane, Piute, and San Juan; British Columbia to Manitoba and south to California and Iowa; 45 (vii). Some of the Utah specimens have very small perigynia (only 2.2 mm long) but they do not appear to differ in any other way from plants with larger perigynia.

Carex ebenea Rydb. Ebony Sedge. Plants 19–59 cm tall, densely caespitose; rhizomes lacking or short; leaves basal and on the lower culms, the blades 1–4.5 mm wide, flat or nearly so; lowest bract usually lacking, or if present, mostly shorter than the inflorescence, this a head 1.3–2.8 cm long and about as wide, or more commonly slightly narrower (in unpressed specimens), ovate or broadly elliptic, truncate or more commonly cuneate at the base, the internodes of the rachis 0.5–2 mm long; spikes (3) 6–12, gynaeceandrous, commonly 9–15 mm long, averaging over 10 mm long, sessile, densely congested, usually slightly more discernable than in *C. microptera*, ca 5–10 times longer than the internodes of the rachis; pistillate scales slightly shorter and usually narrower (at least distally) than the perigynia, dark brown to blackish brown, with or without hyaline margins; perigynia (4.8) 5.2–7.1 mm long, 0.9–2 mm wide, the better developed ones

commonly 4–6.4 times longer than wide, brown to dark brown in the center and commonly with narrow greenish wings, faintly nerved on both sides, serrulate except near the apex of the prominent slender beak; stigmas 2; achenes lenticular, 1.5–1.8 mm long. Lodgepole pine, Engelmann spruce, meadow, and alpine communities at 2895 to 3570 m in Daggett, Duchesne, Garfield, Grand, Iron, San Juan, Sevier, Summit, Tooele, and Wayne counties; Wyoming to Arizona and New Mexico; 33 (xi). Plants of *C. ebenea* are more similar to *C. haydeniana* than to *C. microptera* (q.v.) especially in the darker colored heads, fewer spikes on the average, and somewhat larger perigynia. They are also more common at higher elevations than is *C. microptera*. However, the perigynia in *C. microptera* are sometimes quite narrow and, except for mostly being shorter, could be mistaken for those *C. ebenea*.

Carex egglestonii Mack. Plants (1.5) 3–9 dm tall, caespitose; rhizomes lacking or very short; leaves borne on the lower culms, the blades 1.5–5 mm wide, flat; lowest bract lacking, shorter than, or rarely equaling the inflorescence, this 1.5–2.7 cm long, 1–3 cm wide, headlike, surpassing the leaves, the lowest internode to ca 5 mm long; spikes 3–6, gynaeandrous, 10–17 mm long, 7–12 mm wide, ovate to nearly globose, sessile, closely aggregated, but more or less evident without dissecting the head, to ca 3 or more times longer than the rachis internodes, with up to 45 or more perigynia; pistillate scales conspicuously shorter and narrower than the perigynia, brownish, with a green or pale brown midstripe and hyaline margins, acute; perigynia (5) 6–8 mm long, 2.5–3.5 mm wide, ovate, elliptic, or lanceolate, greenish or brownish, strongly flattened, with thin broadly winged margins, finely serrulate distally and frequently below, gradually or rather abruptly tapered to a bidentate, more or less flattened, winged beak; anthers 2.5–3.7 mm long; stigmas 2; achenes lenticular. Sagebrush-grass, aspen, forb-grass, Douglas fir, spruce-fir, lodgepole pine, and alpine communities at 2440 to 3475 m in Beaver, Carbon, Duchesne, Emery, Garfield, Grand, Iron, Kane, Milard, Piute, San Juan, Sanpete, Sevier, Summit, Uintah, Utah, and Wasatch counties; Wyoming and Colorado; 48 (xx).

Carex elynoides H. T. Holm Kobresia Sedge. Plants 5–16 cm tall, densely caespitose, lacking rhizomes, the culms and leaves fasciculate; leaves basal and on the lower 1/4 of the rounded culms, mostly equal to, or surpassed by, the inflorescence, the blades 0.3–0.5 mm wide, strongly folded or involute and nearly terete; bract lacking; spike solitary, erect, androgynous, 1–1.8 cm long, the staminate part shorter to longer than the pistillate part, exceeding the perigynia by 3–7 mm; pistillate scales brown to dark brown, the centers usually not noticeably green or pale, the margins hyaline, wider to much wider and mostly longer than the perigynia, these usually 4–12, 2.5–4.5 mm long, oblong or ellipsoid, filled by the mature achene, glabrous or occasionally very sparingly serrulate-ciliolate near the beak; rachilla subequal to the achene; stigmas 3; achenes trigonous. Krummholz and alpine communities at 2865 to 3905 m in Beaver, Box Elder, Duchesne, Garfield, Grand, Iron, Juab, Piute, Salt Lake, San Juan, Sevier, Summit, Utah, Wasatch and Wayne counties; Montana to Colorado and Nevada; 34 (ix). *C. elynoides* is separated from *C. nardina* by a series of features, but these are easily confused. It is more

closely allied to *C. filifolia*, and except for the glabrous or nearly glabrous perigynia and different habitat, it would be almost impossible to distinguish them. It is also easily mistaken for *Kobresia bellardii* (q.v.), which grows in the same kind of habitat.

Carex filifolia Nutt. Threadleaf Sedge. Plants 8–38 cm tall, densely caespitose, without rhizomes, the culms and leaves fasciculate; leaves basal or on the lower 1/4 of the rounded culms, equaling or exceeded by the inflorescence, the blades 0.3–0.5 mm wide, strongly folded to involute and nearly terete; bract lacking; spike solitary, erect, androgynous, 1.3–2.5 cm long, the staminate part usually equaling or longer than the pistillate part, commonly exceeding the perigynia by 8–13 mm; scales light brown or brown with broad white hyaline margins, the pistillate ones wider and longer than the perigynia, these usually 5–15, 3–4.5 mm long, obovoid to ellipsoid, filled by the mature achene, minutely hirtellous at least on the upper 1/2; rachilla subequal to the achene; stigmas 3; achenes trigonous; $2n = 50$. Desert shrub, sagebrush, and pinyon-juniper communities at 1675 to 2225 m in Daggett, Emery, and Wayne counties; Yukon to Manitoba southward to California and Texas; 7 (i).

Carex foetida All. [*C. vernacula* Bailey]. Plants 5–25 cm tall; culms arising singly or 2 or 3 together from rhizomes; leaves basal and on the lower culms, the blades 2–4 mm wide, flat or nearly so; inflorescence a globose or ovoid head 8–16 mm long, surpassing the leaves; lowest bract lacking or shorter than the inflorescence; spikes usually 10 or more, androgynous, ca 4–7 mm long, sessile, very densely crowded and mostly not evident in the head, concealing the very short internodes of the rachis; pistillate scales subequal to the perigynia, dark brown with paler midrib and hyaline margins; perigynia 3.3–4.7 mm long, 1–1.6 mm wide, lanceolate to narrowly elliptic, usually brownish, often with paler greenish margins, flattened, with the marginal nerves prominent, faintly nerved toward the base on both sides, conspicuously beaked; stigmas 2; achenes lenticular. Wet meadow at 3020 to 3200 m in Wasatch County; Washington to Wyoming, south to California and Colorado; 1 (0). Utah materials are referable to var. *vernacula* (Bailey) Kükenthal. The one specimen (Hayward 9948 BRY) seen is rather young and tentatively identified. Other reports of this species in the state are likely based on specimens of *C. jonesii* (q.v.).

Carex geyeri F. Boott Elk Sedge. Plants 15–30 (50) cm tall, more or less caespitose and with short to elongate rhizomes; leaves basal and cauline, the lower ones often reduced to bladeless sheaths, the blades 1–3 mm wide, flat or nearly so, evergreen, the tips often turning yellow or brown but the lower parts remaining green through at least one winter; spike solitary, erect, androgynous, the staminate part 1–2 (3) cm long, linear, the pistillate usually with 1 or 2 plump perigynia, these proximal to or somewhat remote from the staminate part; bract lacking or in robust specimens to 1.5 cm long; scales light brown, with broad hyaline margins, the pistillate ones usually equaling or to 4 mm longer than the perigynia; perigynia solitary or, if 2, rather remote, with the internode subequal to or longer than the perigynia, 5–6 mm long, 2-ribbed, greenish or light brown, ellipsoid or obovoid; rachilla obsolete or less than 1/2 as long as the achene; stigmas 3; achenes trigonous, filling the perigynium. Mountain brush, ponderosa pine, aspen, Douglas fir,

lodgepole pine, and spruce-fir communities at 1830 to 3300 m in Cache, Carbon, Daggett, Duchesne, Grand, Juab, Millard, Morgan, Salt Lake, San Juan, Sanpete, Summit, Tooele, Uintah, Utah, and Wasatch counties; Alberta and British Columbia south to California and Colorado; 47 (xii).

Carex haydeniana Olney in Wats. Cloud Sedge. [*C. nubicola* Mack.]. Plants 9–33 cm tall, densely caespitose; rhizomes lacking or very short; leaves basal and on the lower culm, the blades 1–4 mm wide; lowest bract lacking or, if present, not over 1/2 as long as the inflorescence; internodes of the rachis ca 0.5–1 mm long; inflorescence a head 1–1.5 cm long, ovoid to nearly orbicular in outline, usually truncate at the base, surpassing the leaves; spikes 3–8, gynaeandrous, 7–11 mm long, ovate or nearly so, sessile, densely congested, hardly if at all discernible without dissecting the head, 7–10 times longer than the internodes of the rachis; pistillate scales shorter and narrower than the perigynia, dark brown to blackish, with a lighter brown or green midrib, the margins narrowly hyaline or not; perigynia 4–6 (6.3) mm long, (1.7) 2.2–2.8 mm wide, 1.6–2.9 times longer than wide, ovate or lance-ovate to elliptic, brown, dark brown, or blackish, nearly as dark as the scales or somewhat lighter and sometimes the margins green, faintly nerved dorsally, nerveless or faintly nerved ventrally, strongly flattened except where distended by the achene, the margins thin and winged, serrulate except on the subterete beak tip; stigmas 2; achenes lenticular, commonly 1.5–2 mm long. Spruce-fir, limber pine, Engelmann spruce, krummholz, and alpine communities at (2650) 2890 to 3965 m in Beaver, Box Elder, Cache, Duchesne, Garfield, Salt Lake, Sanpete, Summit, Tooele, Uintah, Utah, and Wayne counties; British Columbia and Alberta, south to California and Colorado; 45 (x). This species is similar to and probably transitional with *C. microptera* (q.v.).

Carex hoodii F. Boott in Hook. Plants (20) 30–62 cm tall, densely caespitose; rhizomes lacking or very short; leaves basal and on the lower culm; lowest bract lacking or shorter than the inflorescence, this 1–2 cm long, 0.7–1.5 cm wide, headlike, oblong to nearly orbicular; spikes all tightly congested or the lowest slightly separated, 4–12, androgynous, not over 5 mm long, with ca 4–12 perigynia, sessile; pistillate scales equal to or slightly shorter than the perigynia, brown with a green midstripe and scarious margins; perigynia 3.5–4.6 mm long, 1.5–2 mm wide, narrowly elliptic to ovate, the body brown to dark brown, with greenish serrulate (at 20x magnification) slightly winged margins and beak, (the wings more pronounced than in *C. occidentalis*), the beak bidentate (more so than in *C. occidentalis*), the teeth ca 0.3–0.5 mm long, the marginal nerves on the winged edges or marginally on the ventral face, the dorsal and ventral faces nerveless or faintly so; stigmas 2; achenes lenticular. Sagebrush-grass, mountain brush, aspen, tall forb, forb-grass, spruce, and fir communities at 2105 to 3050 m in Beaver, Box Elder, Cache, Carbon, Daggett, Davis, Duchesne, Grand, Juab, Millard, Morgan, Piute, Rich, Salt Lake, Sanpete, Sevier, Summit, Tooele, Uintah, Utah, Wasatch, and Weber counties; British Columbia to Saskatchewan and south to California and Colorado; 55 (x). This species is not easily distinguished from *C. occidentalis* (q.v.).

Carex hystricina Muhl. ex Willd. Bottlebrush Sedge. Plants 3–6 (10) dm tall; culms clustered on rhizomes;

leaves basal and on the lower culm, the lowermost leaves sometimes reduced to bladeless sheaths, the upper ones with flat blades 2–9 mm wide; inflorescence 6–10 cm long; terminal spike staminate or rarely gynaeandrous, 2–3 cm long; lateral spikes 1–3, pistillate, (1) 1.5–3 cm long, 12–15 mm wide, ascending to strongly spreading, on slender peduncles to 5 cm long or the upper one sessile or subsessile, the lowest subtended by a leafy bract usually exceeding the inflorescence, this usually sheathless or the sheath closed for up to 14 mm; pistillate spikes also with leafy bracts; pistillate scales equaling or much shorter than the perigynia, pale green or straw colored in age, aristate-awned, the awn 2–6 mm long and serrulate-ciliolate; perigynia 5–7 mm long, pale green, prominently nerved, lanceolate or lance-ovate, slightly inflated, with a conspicuous narrow beak ca 2 mm long, strongly spreading and giving a bristly appearance to the spikes; stigmas 3; achenes trigonous, much smaller than the perigynia; style continuous with, persistent on, and of the same firm texture as the achene, straight or bent in age; $2n = 58$. Riparian and wet meadow communities of the Colorado and Green rivers drainages at 1370 to 1920 m in Carbon, Garfield, Grand, Kane, San Juan, Uintah, and Washington counties; Washington to New Brunswick and south to California and Virginia; 10 (i).

Carex illota Bailey Sheep Sedge. Plants 10–42 cm tall, densely tufted; rhizomes lacking or short; leaves basal and on the lower culm, the blades 0.5–2.8 mm wide, flat; bracts not much larger than the scales; inflorescence 0.8–1.4 cm long, nearly or fully as wide as long, headlike, much surpassing the leaves; spikes 3–6, gynaeandrous, ca 4–6 mm long, sessile, closely aggregated and scarcely evident from one another in the dense head, with 5–15 ascending or spreading perigynia; pistillate scales ca 1/2–3/4 as long as the perigynia, blackish or black brown, often with a greenish or yellow brown midstripe and with or nearly without hyaline margins; perigynia 2.5–3 mm long, 1–1.4 mm wide, lanceolate to narrowly ovate, yellowish or greenish brown to blackish, dorsally and sometimes ventrally nerved, the nerves sometimes reddish, the margins entire, rounded or rather sharp, sometimes with very small wings in the distal portion, gradually to rather abruptly tapered to an ill-defined or conspicuous beak, the beak usually blackish, obliquely cleft, the dorsal suture conspicuous through the length of the beak and onto the distal part of the body, usually with an overlapping involute flap; stigmas 2; achenes lenticular. Wet and boggy meadows, flooded pond and lake margins, and along streams of the Uinta and central Wasatch mts. at 2285 to 3505 m in Daggett, Duchesne, Salt Lake, Summit, Uintah, and Wasatch counties; British Columbia to Montana, south to California and Colorado; 30 (xi). *C. illota* has about as many, if not more, affinities with section *Stellulatae* as it does with section *Ovales*.

Carex interior Bailey Inland Sedge. Plants 17–45 cm tall, densely caespitose; rhizomes lacking; leaves borne on the lower 1/3 of the culms, the blades 1–2 mm wide; lowest bract lacking; inflorescence 0.8–2 cm long, 4–6 mm wide, included in or exerted beyond the leaves; spikes (2) 3 or 4, sessile, gynaeandrous, the terminal one often clavate with a conspicuous slender staminate portion, rarely all staminate, 7–10 mm long, the lateral ones ca 4–6 mm long and about as wide, with only a few staminate flowers and (1) 5–10 perigynia, rather closely spaced but readily discerned, subequal to or a little longer

than the internodes of the rachis; pistillate scales shorter than the perigynia, pale green, stramineous or marked with brown, with broad hyaline margins; perigynia widely spreading, beaked but not conspicuously so as in *C. muricata* and the spikes not so bristly, 2.2–3.2 mm long including the shallowly bidentate serrulate beak, this 1/4–1/2 as long as the body, not winged or thin-margined, the marginal nerves prominent and slightly ridged, these displaced toward the flattened ventral surface, the dorsal surface convex; stigmas 2; achenes lenticular; $2n = 54$. Wet often calcareous boggy meadows at 1890 to 3170 m in Beaver, Cache, Duchesne, Emery, Garfield, Iron, Kane, Salt Lake, Sanpete, Summit, and Uintah counties; British Columbia to Labrador and south to Mexico and Pennsylvania; 12 (ii).

Carex jonesii Bailey Plants 15–60 cm tall, caespitose or the culms commonly scattered along conspicuous rhizomes; leaves clustered on the lower 1/4 of the culm, the lower ones often bladeless, the upper ones with flat blades 1.5–3 mm wide, the sheaths neither cross-rugulose nor thickened at the mouth; inflorescence a head, 0.8–2 cm long, 7–11 mm wide, much surpassing the leaves; spikes 4–8, less than 1 cm long, androgynous, the staminate flowers inconspicuous; pistillate scales shorter than the perigynia but as wide, brownish to blackish with hyaline margins; perigynia 3–4 mm long, 1.2–1.5 mm wide, widest below the middle, ovate-lanceolate to lanceolate, gradually tapering to a smooth or slightly serrulate beak, stramineous to dark brown, widely spreading, nerved on both sides, the marginal nerves not (or hardly) more evident than the facial nerves; stigmas 2; achenes lenticular. Meadows and along streams at 2500 to 3050 m in Beaver, Juab, and Salt Lake counties; Washington to California and east to Colorado; 8 (iii). In manuals this taxon is often keyed as being caespitose, either without rhizomes or with very short ones. Our specimens commonly have conspicuously prolonged rhizomes and their presence has probably resulted in some confusion with materials of *C. foetida*.

Carex lanuginosa Michx. Woolly Sedge. [*C. lasiocarpa* var. *lanuginosa* Kuenthal]. Plants 24–80 cm tall or taller; culms arising singly or more often few together or in small tufts from thick creeping rhizomes; leaves mostly borne on the lower 1/2 of the culms, the lower ones often reduced to bladeless sheaths, the upper ones with flat blades 2–6 mm wide; inflorescence 8–21 cm long, leafy bracteate, the first and sometimes the second bracts equaling to much surpassing the inflorescence, mostly not sheathing but the lowest one sometimes with a closed sheath to 17 mm long; terminal spike staminate, 1.7–4.5 cm long, cylindrical, sessile or subsessile or on peduncles to 7 cm long, often subtended by 1–2 smaller staminate spikes; lateral pistillate spikes 1–3 (4), 1–4.8 cm long, 5–7 mm wide, the lower ones well spaced and mostly shorter than their internodes, sessile or nearly so, or on peduncles up to 8 cm long; pistillate scales usually shorter and narrower than the perigynia, acute or awn-tipped, brownish or purplish, typically with a green or pale midstripe; perigynia densely velutinous or velutinous-sericeous, 3.3–5 mm long, ovoid to subglobose, with an abrupt conspicuous bidentate beak, many-ribbed, thick-walled; stigmas 3; achene trigonous, loosely filling the perigynium; $2n = 78$. Along streams, rivers, ponds and lakes, and other wet places at 1250 to 2805 m in all Utah counties except Millard, Morgan, and Tooele; British

Columbia to New Brunswick, south to California and Arkansas; 71 (vi).

Carex lasiocarpa Ehrh. Slender Sedge. Plants 3–8 cm tall or taller; culms reddish or purplish at the base, loosely caespitose, from long creeping robust rhizomes; leaves mostly on the lower 1/2 of the culms, the lower ones reduced to bladeless sheaths, the upper ones with blades 2 mm wide or less, these flattish at the base, strongly involute apically and long-attenuate; inflorescence 12–21 cm long; terminal spike staminate, 3–5 cm long, closely or remotely subtended by a smaller staminate spike; pistillate spikes 2 or 3, below the staminate ones, rarely with a few staminate flowers apically, 1–2.5 (3) cm long, more or less cylindrical, sessile or on peduncles to ca 4 mm long, well spaced, and shorter than the internodes of the rachis, each subtended by a leafy bract, these from shorter to longer than the inflorescence; pistillate scales aristate-awned, the body narrower than the perigynia, the awn serrulate-ciliolate, exceeding the lower perigynia, but shorter than the upper perigynia; perigynia pubescent as in *C. lanuginosa*, 2.5–5 mm long, broadly obovoid to evoid, abruptly contracted to a bidentate beak; stigmas 3; achenes trigonous, loosely filling the perigynia; $2n = 56$. Swampy meadows and ponds (in water to ca 30 cm deep) on subalpine moraines at 2950 to 3000 m in the Uinta Mts., Daggett and Uintah counties; Alaska to New Brunswick, south to California and Tennessee; 5 (iv).

Carex lenticularis Michx. [*C. kelloggii* W. Boott]. Plants 15–61 cm tall, caespitose from fibrous roots, the larger roots covered with feltlike yellowish or yellow brown hairs; rhizomes lacking or short; leaves mostly on the lower 1/4 of the culms, the blades 1–2.6 mm wide; lowest bract foliose, shorter than or exceeding the inflorescence, this 4–13 cm long, with a solitary (or 2) staminate spike (s) 1–3 cm long above 2–4 cylindrical pistillate ones, these 0.6–4 cm long and 3–4 mm wide, the uppermost pistillate one sometimes reduced; pistillate scales shorter and narrower than the perigynia, blackish or black purple with a green midrib, this shorter than or equaling the tip of the scale and neither excurrent nor ridged; perigynia 2–3 mm long, lanceolate, elliptic to ovate, more or less faintly nerved dorsally and ventrally, deciduous at maturity, usually with a well-defined stipe 0.1–0.4 mm long, green except for the often blackish beak, this 0.1–0.4 mm long, entire; stigmas 2; achenes lenticular; $n = 34, 44$. Stream and river banks, wet meadows, and pond, lake, seep, and spring margins, where sometimes partly submerged, at 1860 to 3265 m in Duchesne, Salt Lake, Summit, Tooele, Uintah, Utah, and Wasatch counties; Alaska to Labrador south to California and Michigan; 42 (vii). This taxon is distinguished from others in the section Atratae by the very narrow leaves, narrow spikes, caespitose habit, numerous fibrous roots often covered with yellowish or yellow brown feltlike hairs, and by the quite stipitate and rather readily deciduous perigynia. The scales and beaks of the perigynia are like those in *C. aquatilis*, while the perigynial nerves indicate an alliance with *C. nebrascensis*.

Carex leporinella Mack. Sierra-hare Sedge. Plants 11–28 cm tall, densely caespitose; rhizomes lacking or very short; leaves basal and on the lower culm, the blades 1–2 mm wide, flat or channeled; lowest bract lacking or shorter than the inflorescence, this 12–25 mm long, 5–12 mm wide, headlike, included in the leaves or surpassing them, the lowest internode usually 1–3 mm long; spikes

3–6, gynaeandrous, 5–11 mm long, 3–5 mm wide, sessile, densely aggregated or the lower ones somewhat separated, with 8–22 perigynia; pistillate scales subequal to and as wide as the perigynia, brown, with a green or pale midrib and hyaline margins; perigynia 2.9–4.3 mm long, 1–1.5 mm wide, elliptic-lanceolate to elliptic, greenish to brownish, sharp-edged but scarcely winged or the wings very narrow, serrulate, evidently nerved dorsally, not nerved or faintly so ventrally, gradually tapering to an ill-defined beak; stigmas 2; achenes lenticular. Wet and drying meadows, often in drying mud of ephemeral pools or around ponds and lakes at 2835 to 3200 m in the central and western Uinta Mts., Duchesne, Summit, and Wasatch counties; Washington to Idaho, south to California; 8 (v).

Carex leptalea Wahl. Flaccid Sedge. Plants 16–35 cm tall, densely caespitose, with slender rhizomes, the rhizomes obscured by the matted habit; culms slender, rather flaccid, usually exceeding the numerous fine leaves; leaves basal or nearly so, rather lax, the blades 0.4–1 mm wide, flat or somewhat folded; bract lacking; spike solitary, androgynous, 4–6 mm long, the staminate part included in or slightly exceeding the pistillate part; scales greenish or pale brown, more or less hyaline, the pistillate ones mostly shorter than the perigynia and soon deciduous; perigynia 1–3, 2.5–3.5 mm long, pale green, retuse or notched at the beakless tip, elliptic or nearly so, finely striate, substipitate and more or less spongy at the base, empty in the upper 1/2 or nearly so; rachilla lacking; stigmas 3; achenes trigonous; $2n = 52$. Shady seepy bogs at 2195 to 2230 m in Uinta and Whiterocks Canyons, Uinta Mts., Duchesne and Uintah counties; Alaska to Labrador, south to northern California and Florida; 4 (iv).

Carex limnophila F. Hermann Pond Sedge. Plants 20–45 cm tall, caespitose; rhizomes lacking or very short; leaves borne on the lower 1/4 of the culms, the lower ones sometimes reduced to bladeless sheaths, the upper ones with blades 1–3 mm wide, these flat or nearly so; lowest bract lacking or shorter than the inflorescence, this head-like, 7–15 (18) mm long, 5–10 mm wide, usually surpassing the leaves; spikes 4–8, gynaeandrous, 4–7 mm long, densely aggregated and hardly or not evident without dissecting the head, mostly concealing the very short internodes of the rachis; pistillate scales subequal to the perigynia, brown with hyaline margins and sometimes a pale midrib; perigynia 2.5–3.2 (3.5) mm long, 1.1–1.7 mm wide, lanceolate to ovate, plano-convex, brown or blackish brown and faintly nerved dorsally, brownish and nerveless ventrally but often with 1 or 2 transverse folds near the middle or on the lower 1/2 of the body, tapered or abruptly contracted to a short, obliquely cleft beak, doubly serrulate to below the middle; stigmas 2; achenes lenticular. Wet meadows at 2165 to 2750 m in Daggett, Duchesne, Emery, Juab, and Uintah counties; Washington to Alberta and south to Nevada and Colorado; 4 (i). Perhaps *C. limnophila* represents a diminutive phase of *C. pachystachya*. One specimen (Goodrich 19593 BRY) has perigynia 3.5 mm long (the minimum for *C. pachystachya* and the maximum for *C. limnophila*), and a few of the perigynia have transverse folds on the ventral side as in *C. limnophila*, but the inflorescence is 15–20 mm long, well within the range of *C. pachystachya* but beyond that listed for *C. limnophila*.

Carex limosa L. Mud Sedge. Plants 13–26 cm tall, often glaucous; culms arising singly or 2 or 3 together from

slender rhizomes; roots covered with a yellowish or yellowish brown feltlike tomentum; leaves mostly on the lower 1/2 of the culms, the lower ones usually reduced to bladeless sheaths, the upper ones with blades 0.5–1.5 mm wide, more or less flat, the midrib strongly keeled below, often sharply serrulate; lowest bract from shorter to longer than the inflorescence, this mostly 3.5–6.5 cm long; terminal spike staminate, (1) 1.5–2.1 cm long; lateral spikes 1 or 2, pistillate or occasionally with 1 or 2 staminate flowers apically, 8–18 mm long, spreading or drooping, on flexuous peduncles 5–22 mm long, or rarely the lowest spike on an elongate peduncle originating near the culm base; pistillate scales shorter than to slightly longer than and nearly as wide as the perigynia, greenish brown to dark reddish brown, with a green center, the margins not or scarcely hyaline, obtuse or acute to cuspidate; perigynia 2.9–3.5 mm long, 1.2–1.9 mm wide, substipitate, with a very short, more or less conspicuous beak, pale green and densely white-granular (the grains visible at high magnification); stigmas 3; achenes trigonous; $2n = 56, 64$. Floating bogs and boggy meadows at 2955 to 3200 m in the Uinta Mts., Duchesne, Summit, and Uintah counties; circumboreal, south in America to California; 6 (iv).

Carex luzulina Olney Woodrush Sedge. [*C. ablata* Bailey; *C. fissuricola* Mack.; *C. luzulina* var. *ablata* F. Hermann]. Plants 15–80 cm tall, tufted; rhizomes lacking or short; leaves basal and 1–3 cauline, these with closed sheaths 3–5 cm long or longer, the blades 3–9 mm wide, flat; lowest bract with a closed sheath 1–4.5 cm long, shorter than the inflorescence and mostly not exceeding the next lowest spike; inflorescence 6.5–17 cm long, surpassing the leaves; terminal spike staminate or with a few perigynia at the base, 1–2 cm long, sessile or on a short peduncle; lateral spikes 4–5, 1–3 cm long, the upper 1 or 2 crowded with the staminate spike, sessile or nearly so, pistillate or with a few stamens at the apex, the lower ones pistillate and well separated, borne on slender elongate peduncles, the lowest peduncle to 8 cm long, ca 1/2 of it enclosed in the sheath of the bract, the next lowest peduncle ca 1–2 cm long and 1/2 or more of it enclosed in the sheath of the second bract; pistillate scales dark brown with broad hyaline, sometimes minutely frimbiate or ciliate margins, subequal to the perigynia but not covering the beak; perigynia 3–5 mm long, 1–1.5 mm wide, lanceolate or lance-ovate, compressed, ciliolate-serrulate; stigmas 3; achenes trigonous. Engelmann spruce and meadow communities, often along streams at 2590 to 3350 m in Beaver, Piute, and Salt Lake counties; British Columbia to Montana and south to California; 2 (0).

Carex microglochin Wahl. Plants (5) 15–25 cm tall; culms arising few together from slender rhizomes, the few leaves mostly toward the base; leaf blades ca 0.5–0.8 mm wide, channeled or nearly terete; bract lacking; spike solitary, androgynous, ca 0.5–1 cm long, 3–5 mm wide, erect; scales brownish or tinged with purple, the pistillate ones almost half as long as the perigynia, quickly deciduous; perigynia subulate or linear lanceolate, with the rachilla conspicuously exerted from the orifice, 3–5 mm long including the rachilla, ca 1 mm wide at the base, strongly spreading, soon deflexed and deciduous; stigmas 3; achenes elongate, nearly cylindrical or obtusely trigonous; $2n = 58$. Calcareous boggy meadows at 2800 to 2830 m in Duchesne and Emery counties; Greenland to Alaska, southward to Quebec, Washington and Colorado; 4 (iii).

Carex microptera Mack. Small-wing Sedge. [*C. macloviana* var. *microptera* (Mack.) J. Boivin; *C. festucella* Mack.]. Plants 2–8 dm tall, densely caespitose; rhizomes lacking or very short; leaves basal and on the lower culm, the blades 1–5 mm wide, flat or nearly so; lowest bract mostly lacking, rarely to ca 1/2 as long as the inflorescence, this a head, 1.2–2.5 cm long and as wide, orbicular or nearly so, usually truncate at the base, the internodes of the rachis ca 0.5–2 mm long or the lower one to 3 (4) mm long; spikes (2) 5–15 (21), gynaeceandrous, commonly 5–11 mm long, sessile, densely congested, hardly if at all discernable without dissecting the head, much longer than the internodes of the rachis; pistillate scales shorter and narrower than the perigynia, brownish; perigynia 3.2–5 mm long, 1.3–2.2 mm wide, 2–3 (4) times longer than wide, greenish or brownish to dark brown in age, with a green or pale midstripe, lightly or obscurely nerved on both sides, strongly flattened, except where distended by the mature achene, the margins thin, winged, serrulate except on the more or less terete beak-tip, not hyaline or very narrowly so; stigmas 2; achenes lenticular, commonly 1.1–1.5 mm long. Moist places in many montane plant communities at 1525 to 3415 m in all Utah counties except Davis and Rich, British Columbia to Saskatchewan, south to California and New Mexico; 215 (xvii). This is one of the most common and widespread sedges in the state. It is often confused with several others; among which are *C. hoodii* that is distinguished by its androgynous spikes. *C. microptera* forms a series of intergrading forms with *C. ebenea*, *C. haydeniana*, *C. pachystachya*, and *C. subfusca*. All of the above listed species except *C. ebenea* have been reduced previously to varietal status under *C. macloviana* Urv. The comments by Cronquist et al. (1977) are pertinent.

Carex misandra R. Br. Shortleaf Sedge. Plants 10–30 cm tall, densely caespitose; rhizomes lacking or very short; leaves basal and on the lower culm, all bearing flat blades 1–4 mm wide; lowest bract with a closed sheath 7–20 mm long, this subequal to or longer than the blade, the second bract also sheathing; inflorescence ca 2–5 cm long, usually surpassing the leaves, with 3 or 4 spikes 1–1.5 cm long, the terminal one gynaeceandrous or occasionally pistillate, the lateral ones pistillate, often spreading or drooping, on long slender peduncles, these enveloped basally in the closed sheath of the bracts, the exerted portion mostly longer than the spikes; pistillate scales shorter but commonly wider than the perigynia, brown to dark purple, with hyaline margins and sometimes a paler midrib; perigynia 3.3–5 mm long, ca 1 mm wide, lanceolate, more or less flattened, especially distally, sometimes stipitate at the base, very gradually tapering to a beak, ciliolate-serrulate in the distal 1/2, nerveless or nearly so except at the margins, brown or purple distally, pale where covered by the scale; stigmas 3; achenes trigonous; $2n = 40$. Alpine tundra communities at 3600 to 3960 m in the Uinta Mts., Duchesne and Summit counties; circumboreal, and south in America to Alberta and Quebec, disjunct in Colorado; 3 (0).

Carex multicostata Mack. Many-ribbed Sedge. Plants 15–70 cm tall, caespitose; rhizomes lacking or very short; leaves borne on the lower 1/4 of the culms, the lower ones bladeless or nearly so, the upper ones with blades 2–4 mm wide; lowest bract lacking or shorter than the inflorescence, this 1.5–4 cm long, 14–20 mm thick, headlike, surpassing the leaves, the internodes mostly concealed by

the congested spikes, ca 1–2 mm long or the lowest one slightly longer; spikes 5–10, gynaeceandrous, 6–10 mm long, sessile, closely aggregated but generally more readily discernable than in *C. microptera*; pistillate scales subequal to the length and width of the perigynia or somewhat shorter, light reddish brown or brown, with a pale 3-nerved midstripe and white hyaline margins 0.1–0.3 mm wide; perigynia 4.5–6.2 mm long, 1.6–2.4 mm wide, narrowly to broadly ovate, plano-convex, obscurely to conspicuously many-nerved on both sides or nerveless or few-nerved ventrally, winged-margined and serrulate, tapering to the prominent slender or more or less flattened beak, this margined and serrulate to near the apex or terete and entire for up to 0.6 (1) mm; stigmas 2; achenes lenticular. Moist and wet meadows and along streams at 2625 to 2835 m in Cache, Daggett, Summit, and Uintah counties; Washington to California and east to Idaho; 5 (iv).

Carex muricata L. [*C. anquistior* Mack.]. Plants 1–3 dm tall, densely caespitose; rhizomes lacking or very short; leaves borne on the lower 1/3 of the culms, the blades 1–2.2 mm wide, flat; lowest bract lacking or usually shorter than the first spike; inflorescence 1–2.3 cm long, ca 7 mm wide, exceeded by the leaves or surpassing them; terminal spike gynaeceandrous, usually with more staminate flowers than pistillate ones or sometimes all staminate, 7–10 mm long, often clavate, with a slender staminate portion and wide pistillate portion; lateral spikes (1) 2 or 3, gynaeceandrous, with only a few staminate flowers and 5–10 perigynia, 5–7 mm long and nearly as wide, subequal to or a little longer than the internodes, rather closely spaced but readily evident in the spike; pistillate scales shorter than the perigynia, pale green or pale stramineous with a green midstripe and broad hyaline margins; perigynia widely spreading and conspicuously beaked and giving a bristly appearance to the spikes, 2.8–3.5 (4) mm long, including the prominent serrulate beak 1.1–1.6 mm long, this 1/2 or more as long as the body, neither winged nor thin-margined but the marginal nerves prominent and sometimes ridged, these displaced toward the flattened ventral surface, the dorsal surface convex; stigmas 2; achenes lenticular. Wet meadows and most common in cold boggy places at 2250 to 3180 m in the Uinta Mts., Daggett, Duchesne, Summit, Uintah, and Wasatch counties; circumboreal, south in America to California and North Carolina; 11 (vi). Utah specimens are from areas with quartzitic, noncalcareous substrates. In contrast, the closely related *C. interior* seems to be more common on calcareous or at least basic substrates.

Carex nardina Fries Spikenard Sedge. [*C. hepburnii* F. Boott]. Plants 3–14 cm tall, densely caespitose, without rhizomes, the culms and leaves fasciculate; leaves basal and on the lower rounded culm, mostly surpassing the inflorescence, the blades 0.3–0.7 mm wide, folded to involute and nearly terete; bract lacking; spike solitary, erect, androgynous, 0.5–1 cm long, the staminate part shorter than the pistillate part, exerted beyond the perigynia by 2–3 mm; scales brown with green or pale center and hyaline margins, the pistillate ones as wide or a little wider than the perigynia, these ca 5–15, 3.5–4.5 mm long, elliptic, lanceolate or oblong-obovate, with conspicuous more or less flattened margins, the margins usually serrulate-ciliolate, not wholly filled by the achene; rachilla subequal to the achene; stigmas 2 or 3, with the achenes accordingly lenticular or trigonous; $2n = 68$.

Alpine communities at 3050 to 3505 m in Beaver, Duchesne, Piute, Salt Lake, and Summit counties; circumbo-real, south to Washington and Colorado; 9 (ii). The tendency for 3 stigmas in our plants might reflect introgression with *C. elynoides*.

Carex nebrascensis Dewey Nebraska Sedge. Plants (1) 2–11.5 dm tall or taller, from robust, long-creeping, scaly rhizomes; culms somewhat tufted or more often arising singly or 2–3 together; leaves borne on the lower 1/4 of the culms, the blades 3–11 mm wide; bracts foliose (at least some), often exceeding the inflorescence, this 4–25 cm long, mostly exceeding the leaves, with 1–3 staminate spikes above 2–4 pistillate spikes, the transitional ones occasionally androgynous; terminal staminate spike 1.5–5 cm long, the lateral, if present, to 2.5 cm long; pistillate spikes (1.5) 2–6 (10) cm long, 5–8 mm wide, cylindrical, the lower one pedunculate, the upper sessile or short-pedunculate; pistillate scales mostly longer and narrower than the perigynia, lanceolate or narrowly awl-shaped, glabrous or occasionally ciliate apically, blackish or black purple, with a narrow green or at least pale line in the center, this extending with the midrib to the apex; midrib prominent, sometimes slightly ridged dorsally, sometimes excurrent as a mucro or aristate point, this glabrous or occasionally antrorsely ciliate; perigynia 2.6–4.1 mm long including the beak, elliptic to obovate, with some conspicuous dorsal and ventral nerves plus the marginal nerves, not as flattened as in *C. aquatilis*, greenish at first, yellowish brown in age, sessile or nearly so, persistent, the beak (0.2) 0.4–0.6 mm long, more or less bidentate and ciliate; stigmas 2; achenes lenticular. Wet meadows, swamps, streams and ditches, seeps, springs, ponds, and lakes, where tolerant of some alkali, at 1365 to 3065 m in all Utah counties; Washington to South Dakota, south to California and New Mexico; 136 (viii). Nebraska sedge is the most widespread member of section *Acutae* in Utah. Herbarium specimens are frequently mixed with those of *C. aquatilis* (q.v.).

Carex nelsonii Mack. Plants 10–35 cm tall, caespitose; rhizomes lacking or short; leaves basal and on the lower culm, the blades not over 12 cm long, 1–2.5 mm wide, flat; bract lacking or shorter than the inflorescence, this headlike, 8–15 mm long, 5–12 mm wide, mostly much surpassing the leaves; spikes 2 or 3, sessile, congested and sometimes appearing as 1, 5–10 mm long, 4–8 mm wide, ovate to oblong, the terminal one gynaeandrous, usually larger than the lower pistillate ones; pistillate scales shorter than or equal to the perigynia, blackish or black purple, occasionally with a pale midrib, the margins sometimes narrowly hyaline; perigynia 3–3.8 mm long, 1.1–1.8 mm wide, elliptic, narrowly ovate or obovate, subsessile or with a stipe to 1 mm long, rather gradually tapered to a beak 0.5 mm long, cellular-striate on the faces and minutely papillate, at least apically; stigmas 3; achenes sharply trigonous, the angles more or less nerved, the nerves slightly ridged. Wet and dry meadows, seeps, streams, and in rather dry alpine tundra and on slopes at 2835 to 3870 m in the Uinta Mts., Duchesne, Uintah, and Wasatch counties; Wyoming and Colorado; 16 (v). *C. nelsonii* might better be considered as a variety of *C. nova* (q.v.).

Carex neurophora Mack. Alpine Nerved Sedge. [*C. vernacula* var. *hobsonii* Maguire, type from Bear River Mts.]. Plants 3–7 dm tall, caespitose, with short or long rhizomes; leaves borne on the lower 1/2–3/4 of the culms,

not so clustered toward the base as in *C. jonesii*, the lower ones bladeless, the upper with flat blades 3–3.5 mm wide, the sheaths conspicuously cross-rugulose ventrally and thickened at the mouth; inflorescence a head 15–25 mm long, 8–12 mm thick, surpassing the leaves; spikes 5–10, less than 1 cm long, androgynous, the staminate flowers inconspicuous; pistillate scales ca 1/2 as long and as wide as the perigynia, brownish with a green midrib; perigynia 3.2–4 mm long, ca 1.5 mm wide, light to dark brown, finely nerved on both sides, gradually tapering to a minutely serrulate beak, widely spreading; stigmas 2; achenes lenticular. Wet meadows and along streams at 2500 to 2960 m in Beaver, Cache, Emery, Salt Lake and Wasatch counties; Washington to Montana, south to Nevada and Colorado; 2 (0). A specimen of this species (Lewis 495 BRY) from near Puffer Lake, Beaver County was growing sympatrically with *C. jonesii* (Lewis 489 BRY). The two specimens are clearly marked with features of the respective taxa. The plants of both taxa have been placed erroneously with *C. foetida*.

Carex nigricans C. A. Mey. Black Alpine Sedge. Plants 7–21 cm tall; culms arising few together from short to elongate rhizomes, with few to several leaves mostly borne toward the base; leaf blades 1–3 mm wide, flat or slightly channeled; bract lacking; spike solitary, erect, 0.8–1.8 cm long, 5–8 mm wide, androgynous, the staminate portion ca 1/4–1/2 as long as the pistillate, the scales blackish purple with scarious margins, the staminate ones erect, persistent, the pistillate ones spreading with the perigynia and soon deciduous; perigynia 3–4.5 mm long, lanceolate, often greenish except blackish purple on the beak, soon strongly spreading to declined, often deciduous after maturity, stipitate, the stipe ca 0.5 mm long; rachilla obsolete; stigmas 3; achenes trigonous; $2n = 72?$ Dry to moist or boggy meadows, along streams, and in moist woods at 2430 to 3380 m in Daggett, Duchesne, Salt Lake, Summit, Uintah and Wasatch counties; Alaska and the Siberian Coast, south to California and Colorado; 15 (viii).

Carex norvegica Retz. Scandinavian Sedge. [*C. media* R. Br.]. Plants 12–68 cm tall, densely caespitose, rhizomes lacking or very short; leaves basal and on the lower culm, the blades 1–4 mm wide, flat; lowest bract shorter than or longer than the inflorescence, this (1) 1.5–3.5 (6) cm long, mostly surpassing the leaves; spikes mostly 3 (2–4), 0.5–1.3 cm long, ca 4 mm wide, ovoid to nearly cylindrical, erect or strongly ascending, the terminal one gynaeandrous, equal to or longer than its peduncle, the lower spikes pistillate, mostly longer than their slender peduncles, or the lowest 1 rarely on an elongate peduncle arising on the lower 1/3 of the culm, the intermediate 1 or 2 often nearly or quite sessile, crowded toward the terminal one, and longer than their internodes, with the lowest shorter to longer than its internode; pistillate scales shorter than the perigynia, blackish, or blackish purple, the midrib inconspicuous and rarely pale, sometimes papillate or ciliate, the margins often white hyaline; perigynia 2–2.8 mm long, including the short beak, elliptic to narrowly obovate, green, except for the dark beak, strongly contrasting with the dark scales, becoming greenish brown in age, cellular-striate; stigmas 3; achenes trigonous, the angles slightly rounded, not strongly nerved; $2n = 54, 56$. Aspen, lodgepole pine, spruce, fir, and wet meadow communities, often along streams or around seeps and springs, at 2255 to 3370 m in Beaver,

Daggett, Duchesne, Garfield, Iron, Salt Lake, San Juan, Sanpete, Summit, Sevier, Uintah, and Wasatch counties; circumboreal, south in America to Quebec and New Mexico; 27 (x). Specimens of this species are sometimes misidentified as *C. nelsonii* (q.v.).

Carex nota Bailey [*C. pelocarpa* F. Hermann, type from Lamotte Peak, Summit County]. Plants (6) 16–72 cm tall, densely caespitose; rhizome lacking or very short; culms erect to somewhat flexuous and nodding; leaves basal and on the lower culm, the blades 1–5.5 mm wide; bract lacking or more often present and subtending the inflorescence or to 3 cm below it and not surpassing the inflorescence, this a head, 0.9–2.5 cm long, 9–20 mm wide, with 3 or 4 spikes, usually surpassing the leaves; spikes mostly sessile or on peduncles to 3 mm long, 5–15 mm long, 3–8 mm wide, ovoid to oblong, the terminal one gynaeandrous, usually slightly larger than the lateral pistillate ones; pistillate scales shorter than or equaling the perigynia, much narrower, black or purple black, rather glossy; perigynia 3.5–4.9 mm long, 2–3 mm wide, broadly elliptic, obovate, to ovate-orbicular, flattened, with broad margins, conspicuously wider than the achene, greenish at first, but soon blackish or blackish purple, more or less glossy, glabrous or the upper margins ciliolate; stigmas 3; achenes trigonous. Lodgepole pine, Engelmann spruce, meadow, and alpine communities, often along streams but usually in well-drained soil, and in talus, at 2790 to 3690 m in Box Elder, Cache, Daggett, Duchesne, Grand, Piute, Salt Lake, San Juan, Summit, Tooele, Uintah, Utah, and Wasatch counties; Oregon to Montana, south to Nevada and New Mexico; 48 (xxxiii). Specimens of this taxon are occasionally confused with those of *C. nelsonii* (q.v.). Morphological intermediates occur between *C. nova* and *C. albonigra* (q.v.).

Carex obtusata Lilj. Blunt Sedge. Plants 7–20 cm tall; culms usually arising singly from and well spaced (commonly 1–5 cm apart) along very dark brown to purplish black creeping rhizomes; leaves basal or nearly so, the blades ca 1–1.5 mm wide, flat or loosely folded; spike solitary, erect, androgynous, 5–17 mm long, linear to nearly ovoid, the staminate portion longer or shorter than the pistillate portion; scales brownish with hyaline margins, the pistillate ones mostly shorter and narrower than the perigynia, these usually 1–6, 3–4 mm long, narrowly ovoid or ellipsoid, thick-walled, brown or blackish brown, glossy, obscurely to conspicuously ribbed, conspicuously beaked; rachilla subequal to or longer than the achene, often with a flattened, hyaline, apical appendage; styles 3; achenes trigonous, filling the perigynia; $2n = 52$. Sagebrush, mountain brush, aspen, dry meadow, and spruce communities at 1980 to 3050 m in Daggett, Duchesne, Emery, Garfield, Sanpete, Sevier, Uintah, Utah, and Wayne counties; Yukon to Manitoba, south to New Mexico and South Dakota; Eurasia; 17 (vii).

Carex occidentalis Bailey Western Sedge. Plants 2–8 dm tall, densely caespitose; rhizomes lacking or very short; leaves basal and on the lower culm, the blades 1–3 mm wide; lowest bract lacking or less than 1/2 as long as the inflorescence, this (1) 1.5–3 cm long, ca 5–10 mm wide, spikelike to headlike, oblong to linear-oblong or linear, at least the lower spikes usually separated, the first internode of the rachis ca 2–7 mm long; spikes ca 4–10, androgynous, not over 5 mm long, sessile, with ca 4–12 perigynia; pistillate scales equal to and nearly concealing the perigynia, brownish with a green midstripe and hya-

line margins; perigynia 3–3.8 mm long, 1.6–2 mm wide, elliptic to ovate or ovate-orbicular, the body greenish or brownish with greenish, slightly winged, serrulate (use 20x) margins at least in the upper 1/2 and beak, this bidentate, the teeth ca 0.3 mm long, the marginal nerves on the winged edges or scarcely displaced to the ventral surface, the faces faintly nerved or essentially nerveless; stigmas 2; achenes lenticular. Mountain brush, ponderosa pine, aspen, lodgepole pine, and spruce-fir communities at 1830 to 3230 m in Beaver, Box Elder, Cache, Daggett, Duchesne, Garfield, Grand, Iron, Juab, Rich, San Juan, Salt Lake, Sevier, Uintah, Utah, Wasatch, and Washington counties; Wyoming to New Mexico, west to Nevada and Arizona; 39 (xv). The separation of *C. occidentalis* from *C. hoodii* at the species level is rather tenuous. Although the extremes in shape and congestion of the inflorescence are striking, a continuum is seen in the numerous specimens available for examination in the state. Perhaps the perigynia of *C. hoodii* turn dark sooner and are ultimately darker on the average. The perigynia are more strongly margined and more conspicuously serrulate, but these features do not seem convincing at the species level. Plants of the two taxa occupy different ranges in Utah, but there is considerable overlap from Sevier County northward, with *C. hoodii* having a more northerly and westerly distribution.

Carex oederi Retz. Green Sedge. Plants 12–33 cm tall, densely caespitose; rhizomes lacking; leaves basal and on the lower culm, the blades 1–3 mm wide, flat or nearly so; inflorescence 2–5 (10) cm long, exceeded by the leafy bracts; terminal spike 7–21 mm long, staminate or with a few perigynia at the base or intermixed with the staminate flowers; lateral spikes 2–4, pistillate, 0.5–1 cm long, ca 5 mm wide, the upper ones aggregated, closely subtending the terminal spike, and sessile or nearly so, the lowest one approximate and sessile to remote (the internode 5–12 cm long) and on a peduncle to 2.3 cm long, this enclosed in the sheath (to 2 cm long) of the subtending bract; pistillate scales much shorter than the perigynia, pale green, mostly hyaline; perigynia 2.2–3.5 mm long, including the conspicuous beak, pale green or yellow green, strongly ribbed, obovoid; stigmas 3; achenes trigonous, filling the lower part of the perigynia only; $2n = 70, 72$. Marl bogs and wet meadows, mostly with basic substrate, and riparian communities at 1760 to 2745 m in Duchesne, Garfield, Kane, Summit, and Uintah counties; circumboreal, south in America to California and New Jersey; 7 (iii). Our plants are referable to var. *viridula* (Michx.) Kuenthal [*C. viridula* Michx.].

Carex pachystachya Cham. ex Steudel Chamisso Sedge. [*C. macloviana* var. *pachystachya* (Cham. ex Steudel) Kuenthal]. Plants 3–10 dm tall, densely caespitose; rhizomes lacking or very short; leaves borne on the lower 1/2 of the culms, the lower ones reduced to bladeless sheaths, the upper ones with essentially flat blades 2–6 mm wide; lowest bract lacking; inflorescence 15–23 cm long, 13–16 mm wide, usually oblong, but sometimes ovoid, surpassing the leaves or sometimes subequal to or surpassed by them, the internodes of the rachis concealed by the dense spikes or apparent and 2–4 mm long; spikes 4–12, gynaeandrous, 6–9 mm long, closely aggregated, hardly evident without dissecting the head but usually more conspicuous than in *C. microptera*; pistillate scales shorter and narrower than the perigynia, brown, with or without white hyaline margins to 0.1 mm wide; perigynia

3.5–4.3 (5) mm long, 1.1–2 mm wide, ovate, plano-convex to concavo-convex, lightly nerved dorsally, nerveless or lightly nerved and infrequently with a transverse fold ventrally, greenish and soon stramineous or brownish to copper colored, usually widely spreading at maturity and often deciduous, the winged margins rather narrow, serrulate, rather abruptly narrowed into a short, darkened, more or less terete, smooth beak; stigmas 2; achenes lenticular, 1.5–2 mm long, nearly filling the perigynal cavity. Streams, seeps and springs, and in boggy meadows at 1430 to 2470 m in Daggett, Duchesne, Salt Lake, Summit, Uintah, Wasatch, and Weber counties; Alaska to California and east to Alberta and Colorado; 17 (xi). Several specimens from the state are clearly assignable to this taxon, and entire populations (e.g. in Strawberry Valley) from very wet places are typical of the species. However, the plants seem to merge with *C. limnophylla* and *C. microptera* (q.v.). They differ in general from *C. microptera* in being rather rare and restricted to wetter places. The perigynia of *C. pachystachya* are plano-convex with the achene more nearly filling the cavity, and they are not so strongly flattened as in *C. microptera*. Also, they are more widely spreading to deflexed and much sooner deciduous, and the achenes are commonly larger (1.6–2 mm long versus 1.1–1.5 mm).

Carex parryana Dewey [*C. aboriginum* Jones misapplied; *C. parryana* var. *brevisquama* F. Hermann; *C. hallii* Olney]. Plants 18–50 cm tall; culms densely tufted or arising a few together from short to rather elongate rhizomes; leaves basal and on the lower culm, the blades 1–4 mm wide; lowest bract shorter than or subequal to the inflorescence, this 1.8–6 cm long, 5–10 mm wide, with (1) 2–4 (6) spikes, the lowest internode of the rachis ca 0.5–2 times as long as the lowest spike, the upper ones usually equal to or shorter than the spikes; terminal spike gynaeandrous with a short staminate portion or occasionally nearly or entirely staminate or all pistillate, 1.2–3 cm long, 3–5 mm wide, subsessile or on a peduncle to 1.5 cm long; lateral spikes pistillate, 0.7–2.4 cm long, ca 4–5 mm wide, ovoid to cylindrical, sessile or essentially so, or the lowest on a peduncle to 4 cm long; pistillate scales shorter than or subequal to the perigynia and narrower apically, blackish or dark brown purple, with greenish or pale midrib, sometimes ciliolate apically; perigynia 1.9–3 (3.6) mm long, more or less obovate, glabrous to papillate, or occasionally ciliolate to strigose-hirtellous, the dorsal surface greenish marginally and basally and usually blackish purple in the center near the beak; stigmas commonly 3 but sometimes 2; achenes mostly trigonous; $2n = 54$. Silver sagebrush-meadow and wet meadow communities, and also around seeps and springs in desert shrub and pinyon-juniper communities, at 1220 to 3110 m in Cache, Emery, Juab, Sanpete, San Juan, Utah, and Wasatch counties; Mackenzie to Manitoba, south to Nevada and Colorado; 18 (vii). Plants with the terminal spike all staminate or all pistillate are found in the same populations with those that have gynaeandrous spikes. I see no basis for recognition of infraspecific taxa based on these features.

Carex paupercula Michx. Poor Sedge. Plants 15–30 cm tall; culms arising singly or few together from short to long rhizomes; roots covered with a yellowish or yellow brown feltlike tomentum; leaves basal and cauline, mostly bearing blades, the blades usually 1–2 mm wide, flat, sometimes serrulate-ciliolate, especially apically, the

midrib more or less keeled below, this sometimes serrulate; lowest bract shorter than to longer than the inflorescence, this 2–5 cm long; terminal spike staminate or sometimes with 1 to several perigynia at or near the apex, 0.9–1.2 cm long; lateral spikes 1–3, pistillate or often with 1–3 staminate flowers at the base, 0.7–1.6 cm long, spreading-ascending to drooping, on slender flexible peduncles 1–2.5 cm long; pistillate scales longer and slightly narrower than the perigynia, acuminate, brown or dark purple brown; perigynia 2.2–2.9 (3.5) mm long, 1.2–1.7 mm wide, sessile or substipitate, with the beak nearly obsolete, densely white-granular on a pale green background; stigmas 3; achenes trigonous; $n = 29$. Wet and boggy meadows and occasionally along well-drained banks of streams at 2970 to 3125 m in the Uinta Mts., Duchesne, Summit, Uintah, and Wasatch counties; circum-boreal, south to Colorado; 8 (vi). *C. paupercula* is very similar to *C. limosa* (q.v.).

Carex paysonis Clokey [*C. podocarpa* var. *paysonis* (Clokey) J. Boivin; *C. tolmiei* F. Boott misapplied]. Plants 22–40 cm tall, caespitose, with short or somewhat prolonged rhizomes; leaves basal and on the lower culms, or occasionally 1 on the upper culm, the blades 2–6 mm wide, flat; lowest bract from shorter than to as long as the inflorescence, sometimes foliose; inflorescence 3.5–6 cm long; terminal spike staminate, 1.2–1.8 cm long, 4–8 mm wide, on a peduncle 5–10 mm long; lateral spikes 2–5, pistillate, or with 1 or 2 staminate flowers at the apex, (0.8) 1.2–2 cm long, 5–8 mm thick, rather closely aggregated or the lower separated, erect to spreading-ascending or widely spreading, on slender peduncles to 15 mm long or the upper one sessile; pistillate scales subequal to or shorter than the perigynia, black or purple black, the midrib sometimes green or pale, the margins not or scarcely hyaline; perigynia 3.3–4.4 mm long, broadly elliptic to subrotund, abruptly contracted to the beak, rather fragile and thin, strongly flattened, conspicuously wider than and not filled by the achene, soon blackish or dark brown purple or at least strongly suffused with these colors; stigmas 3; achenes trigonous; $2n = 32?$, 60, 62, 64, 66. Alpine tundra and rocky slopes at 3290 to 3660 m in the Uinta Mts., Duchesne and Summit counties; Alberta to Nevada and Oregon; 11 (v).

Carex perglobsa Mack. Mount Baldy Sedge. Plants 6–20 cm tall, loosely caespitose from slender creeping rhizomes; leaves clustered at the base of the culms, the blades 0.7–1.5 mm wide; inflorescence a globose head ca 1 cm in diameter, usually surpassing the leaves; spikes 6–15, androgynous, not evident in the crowded head, less than 1 cm long, the staminate flowers inconspicuous; bracts lacking; pistillate scales subequal to the perigynia, brownish with hyaline margins; perigynia 4–4.75 mm long, 1.7–2.3 mm wide, ovate-elliptic, inflated, gradually tapered to a bidentate beak; stigmas 2; achenes lenticular. Alpine communities at 3688 to 3960 m in the La Sal Mts., Grand and San Juan counties; Colorado; 1 (0). Some specimens of this species from the La Sal Mts. share features of *C. foetida* var. *vernacula* (Cronquist et al. 1977).

Carex petasata Dewey Liddon Sedge. Plants 2–7 dm tall, caespitose; rhizomes lacking or very short; leaves basal and on the lower culm, the blades 1–4 mm wide, flat or channeled; lowest bract lacking; inflorescence 2.2–5 cm long, 8–12 mm wide, spikelike, surpassing the leaves, the lowest internode of the rachis 4–7 mm long, the

second lowest subequal; spikes 3–6, gynaeandrous, 10–22 mm long, 5–7 mm wide, more or less clavate, sessile, loosely aggregated and evident without dissecting the inflorescence, ca 2–3 times longer than the internodes of the rachis; pistillate scales largely concealing, subequal to, and as wide as the perigynia, stramineous or light reddish brown, with a green or pale midstripe and hyaline margins; perigynia (5.7) 6–7.5 (8) mm long, 1.5–2.8 mm wide, lanceolate, narrowly ovate or nearly elliptic, greenish or light brown, plano-convex, with thin winged margins, serrulate at least in the distal 1/2, gradually tapered to an obliquely cleft beak, conspicuously nerved on both sides; stigmas 2; achenes lenticular. Sagebrush-grass, mountain brush, aspen, and grass-forb communities at 2070 to 3050 m in all Utah counties except Carbon, Davis, Grand, Iron, Kane, Morgan, Summit, Washington, Wayne, and Weber; British Columbia to Saskatchewan and south to California and Arizona; 40 (vii). This plant passes into *C. praticola* (q.v.), and probably into *C. phaeocephala*. Further, it is not easily distinguished from *C. xerantica* (q.v.). Additional study of this complex is indicated.

Carex phaeocephala Piper Dunhead Sedge. [*C. eastwoodiana* Stacey]. Plants (10) 15–30 (55) cm tall, densely caespitose; rhizomes lacking; leaves basal and on the lower culm, the blades ca 1–3 mm wide, flat, channeled, or involute; lowest bract lacking or occasionally present and subequal to the inflorescence or longer; inflorescence 1.4–3 cm long, rarely shorter, 5–15 mm wide, equaling or surpassing the leaves; spikes (1) 2–5 (7), gynaeandrous, 8–15 mm long, 5–7 mm thick, sessile, approximate but mostly evident without dissecting the head, mostly twice or more as long as the internodes; lowest internode of the rachis commonly 4–7 mm long; pistillate scales as long and almost as wide as the perigynia, largely concealing them (sometimes pressed to one side in herbarium specimens), brown to dark brown, with green or pale midstripe and usually conspicuous hyaline margins; perigynia 4–5.5 mm long, 1.5–2.2 mm wide, lanceolate to ovate-elliptic, brownish or stramineous, with greenish stramineous thin winged margins, finely but conspicuously nerved dorsally and often ventrally, gradually or rather abruptly tapered to a bidentate beak; stigmas 2; achenes lenticular. Spruce-fir, lodgepole pine-Engelmann spruce, krummholz, and alpine communities, often in rocky places, at 2830 to 3500 m in Beaver, Duchesne, Grand, Iron, Juab, Piute, San Juan, Sanpete, Sevier, Summit, Tooele, Uintah, Utah, and Wasatch counties; British Columbia to Alberta and south to California and Colorado; 40 (xi). This species apparently grades into both *C. petasata* and *C. xerantica* (q.v.).

Carex praeceptorum Mack. Plants 10–31 cm tall, densely to loosely tufted, with very short or somewhat prolonged rhizomes; leaves basal and on the lower culm, the blades 1.5–3 mm wide; lowest bract lacking or shorter than the lowest spike; inflorescence 1–2.7 cm long, ca 5–8 mm wide, usually equaling or surpassing the leaves; spikes 4–6, gynaeandrous, 5–12 mm long, 3–4 mm wide, sessile, approximate or the lower ones somewhat separate, but usually twice as long as the internodes or occasionally equaling them, all usually evident; pistillate scales shorter than the perigynia, brown to dark brown, with a green midstripe and very narrow to rather broad hyaline margins; perigynia 1.7–2.2 (2.5) mm long, 1–1.2 mm wide, elliptic to elliptic-ovate, more or less flattened,

but with rounded (wingless) margins, yellow green or brownish green, (10) 15–25 per spike, slightly granular-roughened, infrequently serrulate on the beak, finely nerved on both sides, the nerves frequently reddish or brown red, sometimes only faintly so, the dorsal suture conspicuous on the beak and extending barely onto the body; stigmas 2; achenes lenticular. Wet and boggy meadows, margins of lakes, ponds, seeps, and springs at 3050 to 3115 m in Beaver, Duchesne, Piute, Salt Lake, Summit, Uintah, and Wasatch counties; Washington to Wyoming, south to Nevada and Colorado; 15 (v). Plants of *C. praeceptorum* are very similar to *C. canescens*. A combination has been made [*C. canescens* var. *praeceptorum* (Mack.) Bailey], and perhaps recognition at the varietal level best represents this taxon. Of the two taxa, *C. praeceptorum* is more restricted and less common. However, they are essentially sympatric in Utah. Only on the La Sal Mts. and Aquarius Plateau is *C. canescens* known in the absence of *C. praeceptorum*.

Carex praegracilis W. Boott Black Creeper Sedge. Plants (1) 1.5–7 dm tall, dioecious (and forming clones) or monoecious; culms arising singly or few together or occasionally tightly clustered, from robust blackish or dark brown rhizomes 2–4 mm thick, these covered with scales that often become filamentous in age; lower leaves reduced to bladeless sheaths, these often dark brown or blackish, the upper leaves borne on the lower 1/4 of the culms, with blades 1–3.5 mm wide; lowest bract lacking or ca 1/2 as long as the inflorescence, this 1.5–4.3 cm long, ca 5–15 mm wide, simple or compound, capitate or spike-like, linear to oblong, usually surpassing the leaves; spikes ca 6–25, androgynous, staminate or pistillate, to ca 1 cm long, closely aggregated, or the lower one somewhat separate, all longer than the rachis internodes, sessile; pistillate scales mostly as long and as wide as the perigynia and largely concealing them, these and the staminate ones brown with a green or paler midrib and hyaline margins; perigynia 2.8–3.5 mm long, 1.1–1.7 mm wide, ovate or lance-ovate to elliptic, usually short-stipitate, the margins rather thin when young, firm in age and slightly turned toward the ventral surface; beak of the perigynium conspicuous, 0.6–1.3 mm long, obliquely cleft, serrulate, the minute teeth often extending on to the body of the perigynium; stigmas 2; achenes lenticular; $2n = 60$. Wet meadows, along streams and ditches, margins of lakes, ponds, seeps and springs, often where saline, or sometimes in rather dry places, in sagebrush-grass and dry meadow communities at 850 to 2965 m in all Utah counties except Iron; British Columbia to Michigan, south to California and Mexico; 96 (xii).

Carex praticola Rydb. Meadow Sedge. Plants 30–80 cm tall, densely caespitose; rhizomes lacking or very short; leaves basal and on the lower culm, the blades 2–4 mm wide, flat; lowest bract lacking or less commonly present and shorter than the inflorescence, this (2.5) 3–4 cm long, 1–1.5 cm wide, spicate, more or less flexuous, sometimes more or less secund, overtopping the leaves, the lowest internode ca 5–12 mm long, the second one as long or nearly so; spikes (2) 4–7, gynaeandrous, (8) 10–15 mm long, ca 5–7 mm wide, usually clavate, sessile, loosely aggregated and evident without dissecting the inflorescence, ca 1–2 times as long as the internodes, or the lower one slightly shorter, and the upper ones to ca 3 times as long; pistillate scales subequal to and as wide as the perigynia, largely concealing them, dull reddish

brown with a green midstripe and broad hyaline margins; perigynia (4) 4.5–5.7 (6) mm long, 1.2–2.1 mm wide, plano-convex, with thin winged margins, serrulate, gradually tapered to a shallowly bidentate beak, finely nerved dorsally, faintly nerved ventrally, the beak more or less terete and not serrulate, at least in the distal portion; stigmas 2; achenes lenticular; $2n = 64$, 70? Aspen, Douglas fir, lodgepole pine, and Engelmann spruce woods and openings at 2740 to 3140 m in Daggett, Duchesne, Sevier, and Summit counties; Alaska to Labrador, south to California and Quebec; 10 (x). Plants of this taxon pass imperceptibly into those of *C. petasata*. Reduction to infraspecific status does not seem unreasonable, but no combination is intended here.

Carex pyrenaica Wahl. Pyrenaean Sedge. Plants 5–15 cm tall, densely caespitose, without rhizomes, the culms and leaves often fasciculate; leaves 2–4 per culm, the lower bladeless, the upper with blades 0.5–1.5 mm wide, flat or loosely to strongly channeled; bract lacking; spike solitary, erect, androgynous, 0.7–2 cm long, 4–7 mm thick, the staminate portion ca 2–4 mm long; pistillate scales tan to dark brown, the margins hyaline, subequal to the perigynia, deciduous in age; perigynia usually (5) 10 or more, ca 2.5–4 mm long, lanceolate, somewhat stipitate and jointed to the rachis, ascending or sometimes reflexed in age; rachilla lacking; stigmas 3; achenes trigonous. Moist places in alpine communities at 3655 to 3690 m in the Uinta Mts. (where rare), Duchesne County; British Columbia to Mackenzie, south to Colorado and California; Eurasia; 2 (0).

Carex raynoldsii Dewey Plants 1.9–8 dm tall, densely caespitose; rhizomes lacking or short; leaves basal and on the lower culm, the blades 2–7 mm wide, flat; lowest bract shorter than to somewhat longer than the inflorescence or sometimes foliose; inflorescence 2–11 cm long, usually surpassing the leaves, the first internode ca 1–7 cm long, the others shorter; terminal spike staminate, 1–1.5 cm long, sessile or nearly so; lateral spikes pistillate, 1–4 (5) 1–2.5 cm long, 6–8 mm wide, the lowest on a peduncle 0.2–2 (5) cm long, the upper one(s) sessile or short-pedunculate; pistillate scales shorter than the perigynia, brownish black or purplish black, sometimes with very narrow hyaline margins; perigynia (3) 3.3–4.4 mm long, elliptic or elliptic-obovoid, somewhat inflated, green or olive green and strongly contrasting with the dark scales, the beak usually purple black; stigmas 3; achenes trigonous. Sagebrush-grass, aspen, tall forb, spruce, and fir communities at 2195 to 3170 m in Beaver, Box Elder, Cache, Carbon, Daggett, Duchesne, Juab, Morgan, Salt Lake, Sanpete, Sevier, Summit, Tooele, Uintah, Utah, and Wasatch counties; British Columbia to Alberta and south to California and Colorado; 32 (x).

Carex retrorsa Schwein. Knotsheath Sedge. Plants 3–10 dm tall; culms densely clustered on short rhizomes; leaves mostly borne on the culms, the blades 4–10 mm wide; inflorescence 5–13 cm long, with 1 staminate, gynaeandrous, or androgynous spike above 4–6 pistillate spikes, these 1.5–4.5 cm long, ca 1.5–2 cm thick, cylindrical, closely spaced and much longer than the internodes of the rachis, or the lower one widely spaced but still produced beyond its internode, each subtended by leaves that much surpass the inflorescence; pistillate scales shorter and narrower than the perigynia, greenish or stramineous, narrowly acute, acuminate, or short-awned; perigynia widely spreading, giving a bristly appearance to

the spikes, 1–10 mm long, shiny, greenish, conspicuously nerved, the body inflated, ellipsoid to subglobose, narrowed to a conspicuously bidentate beak 2–3 (4) mm long; stigmas 3; achenes trigonous, much smaller than the perigynia, the style continuous with, persistent on, and of the same firm texture as the achene, contorted in age; $2n = 70$. Along rivers and margins of ponds and reservoirs at 1400 to 1830 m in Wasatch and Weber counties; British Columbia to Quebec and south to Oregon, Colorado, and New Jersey; 3 (0).

Carex rossii F. Boott Ross Sedge. [*C. brevipes* W. Boott]. Plants 5–32 cm tall, densely caespitose, with or without short rhizomes, often deep reddish purple basally; leaves basal and on the lower culm, mostly overtopping the inflorescence, the blades 0.5–3 mm wide; inflorescence essentially the length of the culms, with the lowest spike borne on a slender peduncle arising near the culm base and much removed from the rest of the inflorescence; terminal spike staminate, 5–12 mm long; lateral spikes mostly 2–5, very short with only 1–4 perigynia, bracteate or leafy bracteate, the lower bracts (excluding those of the basal spike) usually exceeding the inflorescence; pistillate scales shorter than the perigynia, with a greenish, keeled, often scabrescent-ciliate midrib, this flanked by stripes of brown or brownish purple and then by broad hyaline margins; perigynia sparsely to densely puberulent, 2.7–4.5 mm long including the oblique beak, this 0.7–1.8 mm long, the body plump, with 2 prominent marginal nerves; stigmas 3; achenes trigonous, filling the perigynia; $2n = 36$. Sagebrush, pinyon-juniper, mountain brush, ponderosa pine, aspen, lodgepole pine, spruce-fir, dry meadow, and alpine communities at 1340 to 3445 m in all Utah counties except Davis, Emery, Morgan, and Weber; Yukon to California and Arizona east to Michigan; 79 (xii). *Carex geophila* Mack. [*C. pitophila* Mack.] of Arizona, Colorado and New Mexico has been reported for Utah, and would key here. That taxon is reported to have firm leaves, the bract of the lowest nonbasal spike not exceeding the staminate spike, and the perigynium beak 0.4–1.2 mm long.

Carex rostrata Stokes ex With. Beaded Sedge. Plants 6–14 dm tall; culms arising singly or 2–3 together from robust, scaly, long-creeping rhizomes, often spongy thickened and to 1 cm thick near the base; leaves mostly borne on the lower 1/2 of the culm, the lower sheaths septate-nodulose, the blades 3–12 mm wide, flat; ligule tapering across the ventral surface of the blade at a very rounded angle, not noticeably projected into a point; inflorescence 15–45 cm long, with 2–4 staminate spikes borne above 2–3 (5) pistillate ones, the intermediate ones sometimes androgynous; terminal staminate spike (2) 3–8.5 cm long, the lateral staminate ones somewhat to much shorter, approximate to widely separated; pistillate spikes 2.5–10.5 cm long, 6–13 mm wide, cylindrical, sessile or on peduncles to 3 (7) cm long, rarely compound at the base in very large spikes, well spaced and much shorter to longer than the rachis internodes, each subtended by a foliose bract, the bracts often equaling or exceeding the inflorescence; pistillate scales shorter than or subequal to and narrower than the perigynia, greenish, turning red brown to purple brown, with a paler median, narrowly acute to acuminate or short-awned; perigynia strongly spreading, glossy, light to very dark brown, 4–7 mm long, the body inflated, broadly ellipsoid to subglo-

bose, rather abruptly contracted to a prominent, conspicuously bidentate beak 1–2 mm long, the teeth 0.2–1 mm long; stigmas 3; achenes trigonous, much smaller than the perigynia, the style continuous with, persistent on, and of the same firm texture as the achene, twisted or abruptly bent; $2n = 70?$, 72, 76. Ponds and lakes (in water to ca 45 cm deep), swampy meadows, sometimes along streams but mostly in or near quiet water at 1830 to 3200 m in all Utah counties, except Carbon, Davis, Juab, Millard, Tooele, and Washington; circumboreal, south in America to California and Delaware; 90 (iv). One specimen (N. Holmgren et al. 2328 BRY) has sparsely pubescent perigynia and appears to have been influenced by *C. lanuginosa*.

Carex rupestris All. Curly Sedge. [*C. drummondiana* Dewey]. Plants 3–10 (15) cm tall, caespitose, with very short rhizomes; leaves basal or nearly so, the blades 1–2 mm wide, flat or strongly folded, the midrib sometimes conspicuously keeled on the lower side, curved or strongly curled toward the apex in age; spike solitary, erect, 1–2 cm long, 2–4 mm wide, androgynous, the pistillate portion with ca 3–10 (15) perigynia, subequal to or shorter than the staminate portion; scales brownish or purplish, with hyaline margins, the pistillate ones mostly concealing the perigynia, mostly obtuse to rounded; perigynia 3–4 mm long, elliptic, gradually short-stipitate at the base, very short truncate-beaked at the apex, conspicuously nerved; rachilla lacking; stigmas 3; achenes trigonous, purplish black at maturity. Krummholz and alpine tundra communities, often in rocky places, at 3200 to 3660 m in Duchesne, Summit, Uintah, and Wasatch counties; circumboreal, south in North America to Quebec; 10 (vii).

Carex saxatilis L. Russet Sedge. [*C. physocarpa* Presl]. Plants 21–40 (56) cm tall; culms arising singly or rather closely spaced on creeping rhizomes; leaves mostly borne on the lower 1/2 of the culms and sometimes higher, the blades 1.5–3 mm wide, flat; inflorescence 4–9 cm long, with 1–2 (3) staminate spikes 1–3 cm long borne above 1–2 pistillate spikes 1–2.6 cm long and ca 5–8 mm wide, the lateral staminate ones well spaced, subequal to or shorter than the rachis internodes, the pistillate ones sessile or on slender, spreading or drooping peduncles to 3 cm long, each subtended by a leafy bract, the lowest bract usually overtopping the inflorescence; pistillate scales slightly to conspicuously shorter than the perigynia, acute, very dark brown, purple black or black, sometimes with a pale midstripe, the margins whitish hyaline at least toward the often erose tip; perigynia 3.2–5.2 mm long, 1.5–3.3 mm wide, lanceolate to nearly orbicular, slightly inflated, soon black or blackish purple at least where exposed beyond the scale, with marginal or sometimes dorsal nerves conspicuous, nerveless ventrally, tapering to a short beak, the beak nearly entire or with inconspicuous teeth, these not over 0.5 mm long and easily broken off; styles 2 or occasionally 3, sometimes both in the same spike and achenes accordingly lenticular or trigonous, the style continuous with, persistent on, and of the same firm texture as the achene, often strongly bent or recurved back against the achene in age; $2n = 76?$, 80. Wet and boggy meadows and margins of ponds and lakes at 2740 to 3810 m in Duchesne, Garfield, Kane, Summit, Uintah, and Wasatch counties, circumboreal and south in America to Colorado; 33 (x). Utah materials might be referable to *var. major* Olney. Robust specimens are sometimes confused with *C. vesicaria* q.v.

Carex scirpoidea Michx. Plants 4–34 cm tall, unisexual; culms arising singly or few together from rather short but conspicuous rhizomes; leaves basal and on the lower culm, the blades 1.5–3.5 cm long, 3–7 mm wide, linear; scales mostly rounded at the apex, blackish purple with hyaline, ciliolate margins, sometimes sparsely pubescent dorsally, the pistillate ones mostly longer and wider than the perigynia; anthers 3–5 mm long; perigynia obovoid, 2–4 mm long including the beak, pubescent; rachilla obsolete. Dry subalpine meadow, lodgepole pine-Engelmann spruce, krummholz, and alpine tundra communities at 2895 to 4100 m in Cache, Daggett, Duchesne, Garfield, Grand, Iron, San Juan, Summit, and Uintah counties; Labrador to Alaska south to New Hampshire and California; 41 (v). Our materials are referable to *var. pseudoscirpoidea* (Rydb.) Cronq. [*C. pseudoscirpoidea* Rydb.]. Some of the specimens from Iron, Garfield, and Emery counties are similar to *C. curatorum*.

Carex scopulorum H. T. Holm Rock Sedge. [*C. campylocarpa* H. T. Holm; *C. campylocarpa* ssp. affinis Maquire & Holmgren, type from Indian Farm Creek, Deep Creek Mts.]. Plants 22–67 cm long; culms arising singly or few together or somewhat tufted, from robust scaly rhizomes; leaves basal and mostly on the lower culm, the blades (2) 3–7 mm wide; lowest bract foliose but shorter than the inflorescence, this 2.5–9 cm long, with 1 or 2 staminate spikes 1–2.2 cm long above 2–4 cylindrical or ovoid pistillate spikes 1–3 cm long and 5–10 mm wide, the intermediate spikes occasionally androgynous; pistillate scales shorter to longer than the perigynia and mostly narrower at least toward the apex, black or purple black; perigynia 1.8–3.3 mm long, elliptic to broadly obovate, nerveless except for the 2 marginal nerves, blackish to dark reddish brown at least distally, sessile or nearly so, the beak nearly obsolete; stigmas 2, and achenes lenticular, or very rarely stigmas 3 and achenes trigonous. Wet meadows and along streams, Deep Creek, Raft River, and Uinta mts. at 2370 to 2790 m in Box Elder, Daggett, and Juab counties; British Columbia to California and east to Colorado; 10 (viii). The perigynia are the darkest of any among Utah members of section Acutae, and the pistillate spikes are the widest for their length. Occasional specimens from the Wasatch Plateau appear to be intermediate between *C. scopulorum* and *C. aquatilis* (q.v.), with the bract shorter than the inflorescence but with rather narrow pistillate spikes. However, these are referred herein to *C. aquatilis*.

Carex siccata Dewey Silvertop Sedge. [*C. foenea* sensu Svenson, not Willd.]. Plants 19–36 cm tall; culms arising singly or few together and loosely to rather closely clustered on stout rhizomes; leaves clustered on the lower 1/4 of the culms, the lower ones often reduced to bladeless sheaths, the upper ones with blades 1–2 mm wide, flat, the longer ones subequal to or shorter than the inflorescence, the lowest bract subequal to the lowest spike; inflorescence 1–3 (6) cm long, 5–10 mm wide, linear or clavate or occasionally orbicular; spikes sessile, congested or interrupted, ca 5–12 mm long, the lower ones gynaeandrous or pistillate, some (especially the middle ones) staminate, the upper one often pistillate and closely subtended by a staminate spike and thus falsely appearing to be gynaeandrous; scales light brown with broad hyaline margins, the pistillate ones subequal to the body of the perigynia but surpassed by the beak; perigynia 4.5–6.2 mm long including the prominent beak, flat-

tened, serrulate to near the middle and sometimes below, slightly wing-margined below, the body more or less elliptic; stigmas 2; achenes lenticular, filling the perigynia, sometimes rupturing at maturity; $2n = 70$. Sagebrush, oak, ponderosa pine, aspen, lodgepole pine, Engelmann spruce, and forb-grass communities at 915 to 3170 m in Daggett, Garfield, Grand, San Juan, Uintah, and Washington counties; Maine to the Mackenzie, south to Arizona; 14 (vi).

Carex simulata Mack. Plants 22–45 cm tall, dioecious (and commonly forming clones) or monoecious, the culms mostly arising singly from, and closely to remotely spaced on long, whitish or light brown rhizomes; leaves cauline, mostly borne on the lower 1/4 of the culms, the lower ones reduced to bladeless sheaths, the upper ones with blades 1.5–4 (6) mm wide; bracts subequal to the spikes or the lower 1–3 from 1/2 as long to equaling the inflorescence, long acuminate-caudate; inflorescence 1.8–3.5 cm long, 7–25 mm wide, simple or occasionally compound, headlike, linear to oblong or occasionally ovate, subequal to or surpassing the leaves; spikes commonly 10–20, unisexual or androgynous, crowded and usually concealing the rachis, more or less evident without dissecting the inflorescence; pistillate scales longer than the perigynia, brownish, with narrow to rather broad pale hyaline margins, the midrib sometimes green; perigynia 1.7–2.6 mm long, elliptic-ovate, or nearly orbicular, shining brown, sessile or occasionally very short-stipitate, the margins rounded, not thin, the dorsal surface with a few raised nerves extending to ca 1/2 or more to apex or occasionally nerveless, the ventral nerves like the dorsal ones but mostly shorter and more often lacking, the wall thick and coriaceous, the beak 0.2–0.6 mm long, inconspicuously winged and serrulate near the confluence with the body; stigmas 2; achenes lenticular. Boggy meadows, quaking bogs, and streamside communities, commonly in places with calcareous or at least basic substrate, at 2286 to 2865 m in Box Elder, Daggett, Duchesne, Emery, Garfield, Kane, Sanpete, Sevier, Summit, Uintah, and Wasatch counties; Washington and Alberta, south to California and New Mexico; 35 (xx).

Carex stenophylla Wahl. Narrowleafed Sedge. [*C. eleocharis* Bailey]. Plants 8–28 cm tall; culms arising singly or few together from slender brownish or pale colored rhizomes less than 2 mm in diameter, and with numerous fibrous roots; leaves basal and on the lower culm, the blades 0.5–1.5 mm wide; lowest bract lacking; inflorescence 0.8–2 cm long, 5–10 mm wide, headlike; spikes ca 3–10, sessile, androgynous or rarely all unisexual, 4–9 mm long, longer than the internodes of the rachis and closely aggregated, discernable or not without dissecting the inflorescence; pistillate scales subequal to or slightly longer than the perigynia, brownish, with a dark green or brownish often keeled midrib, and with narrow or broad scarious margins; perigynia 2.6–3.5 mm long, rather narrowly fusiform-elliptic to broadly elliptic-ovate, brownish, the marginal nerves prominent, otherwise obscurely nerved; beak of the perigynium, obliquely cleft, 0.5–1.2 mm long, the dorsal suture inconspicuous; stigmas 2; achenes lenticular; $2n = 60$. Sagebrush-grass, pinyon-juniper, and windswept montane communities at 1920 to 3270 m in Daggett, Duchesne, Garfield, San Juan, Sevier, Uintah, Utah, Wasatch, and Wayne counties; mostly of the Great Plains, but from Iowa to California and south to Arizona; 13 (iv).

Carex stipata Muhl. in Willd. Prickly Sedge. Plants 28–75 cm tall or taller, caespitose; rhizomes lacking or very short; leaves basal and on the lower 1/2 of the culms, the lower culm leaves reduced to bladeless sheaths, the upper ones with blades 4–8 (11) mm wide, flat, the ventral side of the sheath membranous, usually cross-corrugated; inflorescence (2.5) 3–5.5 cm long, 1–2 cm wide, compound but spikelike, with many, short, crowded spikes, appearing bristly from the widely spreading, narrowly beaked perigynia; lowest bract not much if any longer than the lowest branch of the inflorescence, more or less awnlike, usually broken off in older specimens; individual spikes scarcely evident, androgynous, to ca 1 cm long and nearly as wide; pistillate scales mostly shorter than the perigynia, pale or brownish, rather scarious, with the more or less greenish or pale midrib sometimes exerted as an awn-tip; perigynia (3.6) 4–5.2 mm long, widely spreading, lance-triangular or lance-ovate, broadest at the sometimes abruptly truncate, somewhat spongy thickened base, gradually tapered to a long, minutely serrulate beak, conspicuously nerved at least dorsally, subsessile to conspicuously stipitate; stigmas 2; achenes lenticular; $2n = 52$. Wet places at 1525 to 1830 m in Davis, Salt Lake, and Weber counties; Alaska to Newfoundland and south to California and Florida; 3 (0). Utah materials are referable to *var. stipata*.

Carex straminiformis Bailey Mt. Shasta Sedge. Plants 24–45 cm tall, densely caespitose; rhizomes lacking or very short; leaves basal and on the lower culm, the blades 1–3 mm wide, flat or channeled; lowest bract lacking or shorter to slightly longer than the inflorescence, this 1.5–2.5 cm long, 1–2 cm wide, headlike, usually much overtopping the leaves, the lowest internode to ca 5 mm long; spikes 3–9, gynaeandrous, 7–15 mm long, 5–7 mm wide, ovate to nearly globose, sessile, closely aggregated but more or less evident without dissecting the head, ca 3 or more times longer than the internodes of the rachis, with up to 20 perigynia; pistillate scales shorter than or subequal to the perigynia and a little narrower, brownish with a green midstripe and hyaline margins, acute; perigynia 4–5.6 mm long, 1.6–2.5 mm wide, ovate-elliptic, greenish or light brown, strongly flattened with conspicuous thin-winged margins, finely serrulate in the distal 1/2 and sometimes below, gradually or rather abruptly tapered to a bidentate, more or less flattened beak; anthers 1.5–2 mm long; stigmas 2; achenes lenticular. Sagebrush-grass, forb-grass, and Engelmann spruce communities, open slopes and ridges, and rocky cirques at 2740 to 3140 m in Duchesne, Salt Lake, Tooele, Utah, and Wasatch counties; Washington to Montana, and south to California; 12 (vi).

Carex subfusca W. Boott in Wats. Rusty Sedge. [*C. macloviana* var. *subfusca* (W. Boott) Kukenthal]. Plants 20–65 cm tall, densely caespitose; rhizomes lacking or very short; leaves on the lower 1/4 of the culms, the blades 2–4 mm wide, flat; lowest bract lacking or shorter than the inflorescence, this 1–3.5 cm long, 7–12 mm wide, headlike or spikelike, the internodes of the rachis sometimes conspicuous; spikes 4–12, gynaeandrous, ca 5–9 cm long, sessile, the lower approximate and ca 2–3 times as long as the rachis internodes, the upper usually more crowded; pistillate scales shorter and narrower than the perigynia, reddish brown with lighter midstripe and margins; perigynia 2.7–3.2 (3.6) mm long, 1–1.5 mm wide, ovate, plano-convex, many-nerved on both sides or

nerveless or nearly so ventrally, the margin narrowly winged, serrulate, tapering or contracted into a serrulate, more or less flattened beak; stigmas 2; achenes lenticular. Dry meadows at ca 2900 m in Sevier, Washington, and Wayne counties; British Columbia to California and east to Arizona; 3 (0). *C. subfusca* is apparently closely related to *C. microptera* (q.v.) through *C. pachystachya*.

Carex subnigricans Stacey Dark Alpine Sedge. [*C. rachillis* Maquire, type from Gilbert Peak, Summit County]. Plants 5–20 cm tall, sod-forming, with culms arising few together along rhizomes with short internodes; leaves basal or on the lower culm, the blades to ca 1 mm wide, involute or deeply channeled, more or less wiry like the culms; bract lacking; spike solitary, erect, androgynous, 1–2 cm long, 3–6 mm thick, 2.5–3 times as long as thick, the staminate portion very short or quite conspicuous; pistillate scales tan to dark brown, hyaline at the margins, subequal to the perigynia, these (5) 10 or more, 2.5–4 mm long, to 1.5 mm wide, elliptic to ovate; stigmas 3; achenes trigonous, almost filling the perigynia. Moist and boggy meadows at 2965 to 3355 m in Duchesne, Piute, Summit, Uintah, and Wayne counties; Oregon to Wyoming and south to Nevada; 4 (iii).

Carex vallicola Dewey Valley Sedge. Plants 15–56 cm tall, densely caespitose; rhizomes lacking or very short; leaves basal and on the lower culms, the blades 0.5–2.5 mm wide; lowest bract lacking or shorter than the inflorescence, this 0.8–3 cm long, 5–9 mm wide, slightly to much overtopping the leaves, spicate or capitate, shortly interrupted or more often continuous, with the individual spreading perigynia more evident than the individual spikes; spikes ca 2–10, to 5 mm long, with ca 2–7 perigynia, sessile, androgynous, the staminate portion inconspicuous; pistillate scales shorter than the perigynia, with greenish or brownish centers and hyaline margins; perigynia 3.3–3.75 mm long, 1.7–2.3 mm wide, oblong-elliptic, with more or less rounded wingless margins, pale green or straw colored, the marginal nerves somewhat displaced onto the ventral surface, otherwise nerveless or nearly so, the body entire, rather abruptly contracted to a very finely serrulate beak 0.6–1 mm long, this slightly or not at all bidentate; stigmas 2; achenes lenticular, filling the perigynia and sometimes rupturing it at maturity. Sagebrush-grass, mountain brush, ponderosa pine, Douglas fir, aspen, spruce-fir, and dry meadow communities at 1675 to 3010 m in all Utah counties, except Carbon, Davis, Kane, Morgan, San Juan, Wayne, and Weber; California to South Dakota, south to Mexico; 52 (xii).

Carex vesicaria L. Blister Sedge. [*C. exsiccata* Bailey]. Plants 30–75 cm tall, caespitose; rhizomes short or somewhat prolonged; leaves mostly on the lower 1/2 of the culms, the blades 2–4 (8) mm wide, flat, the lower sheaths septate-nodulose; ligules tapering across the ventral surface of the blade at a rather sharp angle and prolonged into a point; inflorescence 9–21 cm long, with 2–3 staminate spikes borne above 2–3 pistillate ones; staminate spikes 2–7 cm long, the terminal one the largest, the lateral spaced or closely subtending the terminal one; pistillate spikes 2–3 (7) cm long, ca 1 cm thick, cylindric, sessile or on peduncles to 2.3 cm long, spaced, subequal to much shorter than the rachis internodes, each subtended by a leafy bract, these often much exceeding the inflorescence; pistillate scales shorter and narrower (at least distally) than the perigynia, stramineous to reddish brown, rarely dark brown, commonly acuminate; perigynia as-

ending, not spreading, 5–6 mm long, inflated, lanceolate or lance-ovate, gradually tapering to a bidentate beak, glossy; stigmas 3; achenes trigonous, much smaller than the perigynia, the style continuous with, persistent on, and of the same firm texture as the achene, strongly bent or contorted with age; $2n = 82$. Ponds, lakes, swamps, and boggy meadows, in standing water to ca 30 cm deep, at 3000 to 3050 m in Duchesne, Iron, Sevier, Summit, and Uintah counties; circumboreal, south in America to California and Delaware; 7 (i). Utah materials are apparently referable to var. *vesicaria*. The few specimens I have examined have 3 stigmas and perigynia 5–6 mm long, with a bidentate beak with teeth not over 0.5 mm long. The perigynia, as well as the scales, are sometimes dark brown when mature and often well before maturity. These features do not exclude *C. saxatilis*, and the dark color of the perigynia and scales strongly indicate that taxon. The plants are taller and have larger spikes that are more ascending than in most Utah specimens of *C. saxatilis*. They are apparently caespitose, and with perigynia gradually tapered to the beak, and with conspicuous dorsal ribs. However, they look as much (or more) like typical specimens of *C. saxatilis* from Utah than they look like Idaho specimens of *C. vesicaria*. Cronquist et al. (1977) noted some anomalous features that seem to align cordilleran plants of *C. saxatilis* with *C. vesicaria* (i.e., the larger perigynia with better developed nerves). More work is indicated.

Carex xerantica Bailey Dry land Sedge. Plants 20–45 cm tall, caespitose, from short stout rhizomes; leaves borne on the lower 1/4 of the culms, the lower ones bladeless or nearly so, the upper ones with blades 2–4 mm wide; lowest bract lacking or shorter than the inflorescence, this 2–4 cm long, 7–15 mm wide, more or less spikelike, usually much surpassing the leaves, the internodes of the rachis obscured or sometimes discernable, the lower 2 collectively 8–18 mm long; spikes 3–6, gynaeceandrous, 8–17 mm long, sessile, approximate but usually readily evident without dissecting the inflorescence, ca twice as long as the internodes of the rachis; pistillate scales shorter to longer than the perigynia, reddish brown with a greenish midstripe and hyaline margins; perigynia 4.2–7 (7.4) mm long, 1.9–2.8 mm wide, elliptic or ovate, slightly to strongly plano-convex, lightly to evidently many-nerved on both sides, or the ventral side nerveless or with few nerves, wing-margined to the tip of the ill-defined flattened beak, serrulate, greenish, stramineous, or pale brown; stigmas 2; achenes lenticular; $2n = 68$. Forb-grass communities and open woods at 2620 to 3505 m in Beaver, Emery, Garfield, Grand, San Juan, Sevier, and Washington counties; Alberta to Minnesota and south to Arizona and New Mexico; 9 (0). Although plants of this taxon have been separated from those of *C. petasata* (q.v.) at the subsection level (Foenaeae versus Specificae), they may not be so distantly related. They have broadly overlapping geographic ranges, and morphological differences are few and overlapping. The flattened versus terete beak of the perigynium is a subtle difference in this case and perhaps does not warrant segregation at the subsection level. Indeed, reduction to infraspecific status might not extend reality, but no combination is proposed here. I am not certain that all specimens placed here or in *C. petasata* are correctly determined, but in general the perigynia are smaller on the average than in *C. petasata*, and, in Utah, the plants are

more commonly found in open exposed places and not so much with sagebrush and aspen. In these respects, *C. xerantica* simulates *C. phaeocephala*, and specimens of these two taxa are sometimes mixed in herbaria. These three taxa together with *C. praticola*, form a complex that is in need of further study.

Cladium R. Br.

Plants perennial from robust scaly rhizomes, with hollow, leafy stems; inflorescence a compound umbel with numerous spikelets, these few-flowered; scales spirally arranged, the lower ones empty or staminate; perfect flower solitary; perianth bristles lacking; stamens 2; style 2 or 3 cleft.

Cladium californicum (Wats.) O'Neill in Tidestr. & Kittell Saw-grass. [*C. mariscus* var. *californicum* Wats.]. Culms 1-2 m tall, subterete to subtriangular, ca 1-1.5 mm thick; leaves 0.8-1.5 cm wide, flat, serrulate, the teeth cartilaginous; umbels 3-10 or more, with several rays and numerous spikes 3-4 mm long; scales few, reddish brown, the lowest one empty, the middle ones empty or subtending staminate flowers, the terminal one subtending a perfect flower; achenes ovoid, ca 2 mm long, without a tubercle. Hanging gardens along Lake Powell at 1125 to 1150 m in Kane and San Juan counties; California to Arizona, south to Mexico; 7 (0). Most of the sites discovered for this plant have been drowned by the rising water of Lake Powell. Leaves at the base of an accumulation of marcescent remains of this plant in Driftwood Canyon were dated at 440 years B.P.

Cyperus L.

Annual or perennial plants with mostly solid, triangular stems; spikelets several to many, arranged in one or usually several capitate to spicate clusters, the terminal cluster commonly sessile or nearly so, the others from rays originating in the axils of sheathless leafy involucre bracts; scales of the spikelets 2-ranked in vertical rows, the lowest one empty and somewhat modified; flowers perfect; perianth lacking; stamens (1-2) 3; styles 2 or 3 or with 2 or 3 branches; achenes lenticular or trigonous.

- 1. Plants perennial, from creeping rhizomes; stamens 3 ... 2
 - Plants annual or short-lived perennial; rhizomes lacking; stamens 1, 2, or 3 ... 3
- 2(1). Spikelets with 5-8 flowers; scales 3-4 mm long; rhizomes short, thick, not ending in a terminal tuber; plants of sandy places in Kane County ... *C. schweinitzii*
 - Spikelets with ca 12-28 flowers; scales 2-3 (4) mm long; rhizomes slender, ending in a terminal tuber; distribution various ... *C. esculentus*
- 3(1). Scales 3-6 mm long, not especially crowded, usually fewer than 10 per spikelet, linear or narrowly lanceolate; stamens 3; plants perhaps to be expected in Utah ... *C. strigosus* L.
 - Scales 1-2 (2.5) mm long, more or less crowded, usually more than 10 per spikelet, lanceolate to ovate or obovate; stamens various ... 4
- 4(3). Stigmas 2; scales blunt, not mucronate or awn-tipped, more or less strongly anthocyanic with a pale midrib; plants perhaps to be expected in Utah ... *C. rivularis* Kunth
 - Stigmas 3; scales tapered or blunt but then usually mucronate or awn-tipped, variously colored but not as above ... 5

- 5(4). Stamens 3; scales broadly rounded or blunt apically, sometimes abruptly mucronate, with broad yellow gold or yellow brown scarious margins, the nerves not conspicuously raised ... *C. erythrorhizos*
 - Stamens 1 or 2; scales gradually tapered to an acuminate or awned tip, the margins variously colored, the nerves not conspicuously raised ... 6
- 6(5). Scales with (5) 7-9 nerves, the slender awn-tip squarrose ... *C. aristatus*
 - Scales with 3 nerves, the acute to acuminate tips not squarrose ... *C. acuminatus*

Cyperus acuminatus Torr. & Hook. Plants annual, 5-25 cm tall; leaves few, borne near the culm base, 1-2 (3) mm wide; involucre bracts unequal, the longest ones to 10 cm long or longer and much surpassing the inflorescence; spikelets in very dense rounded clusters; spikelets 3-7 mm long, strongly flattened; scales ca 2 mm long, 3-nerved, mostly hyaline except for the raised nerves, strongly overlapping, deciduous in age, the tip tending to be shortly recurved-acuminate; rachilla wingless, persistent; stamen solitary; styles trifid for ca 3/4 their length; achenes trigonous. Mud flats and drying shores at ca 1375 m in Millard County; North Dakota to Georgia and west to the Pacific; 4 (0).

Cyperus aristatus Rottb. Bearded Flat-sedge. Plants annual, 2-15 cm tall, tufted, with fibrous roots; leaves borne near the base of the culms, mostly 0.5-2.5 mm wide; involucre bracts commonly 2-6, foliose, some or all exceeding the inflorescence; spikelets in headlike clusters, the terminal cluster sessile, the others, if present, on slender rays to 2 cm long; spikelets 4-10 mm long, flattened; scales ca 1-2 mm long, with (5) 7-9 more or less raised nerves, deciduous with age, the narrowed apex awnlike, 0.3-1 mm long, spreading to somewhat recurved; rachilla wingless, persistent; stamen solitary; style 3-branched; achenes trigonous, 0.6-1 mm long. Seeps, springs, disturbed ground in meadows, margins of ponds and lakes, and flood plains at 1220 to 2015 m in Duchesne, Emery, Garfield, Grand, Salt Lake, San Juan, Uintah, Utah, Washington, and Weber counties; more or less cosmopolitan except at high latitudes; 13 (iii).

Cyperus erythrorhizos Muhl. Redroot Flat-sedge. Plants annual, 10-73 cm tall; culms sharply triangular, arising singly or few to several together; leaves crowded toward the base of the culms, the blades elongate, 2-10 mm wide; involucre bracts commonly 4-10, unequal, the larger ones to 40 cm long, sometimes wider than the leaves; inflorescence compact, or the open and umbelliform clusters of spikelets elongate, sometimes cylindrical, 1-3 cm long, the terminal sessile, the others borne on rays to 9 cm long; spikelets 3-12 mm long, 1-1.5 mm wide, spirally arranged; rachilla narrowly hyaline-winged, the wings readily deciduous in short segments at maturity; scales ca 1-1.5 mm long, broadly rounded or blunt apically, with 3-5 faint lateral nerves, closely overlapping, eventually deciduous, the midrib scarcely excurrent as a blunt mucro; stamens 3; styles 3-branched for ca 1/4-1/2 their length; achenes trigonous, pale, shiny, 0.7-1 mm long. Margins of ponds and lakes and on sand bars along rivers at 1504 to 1820 m in Garfield, Grand, San Juan, Utah, and Washington counties; U. S. and Canada; 18 (0).

Cyperus esculentus L. Chufa Flat-sedge. Plants perennial, 3-7 dm tall; culms sharply triangular, usually arising singly, from numerous fibrous roots and slender rhi-

zomes which terminate in small tubers; leaves few to many, clustered toward the base of the culms, the blades elongate, 3–8 mm wide; involucre bracts ca 3–6, unequal, from shorter than to much exceeding the inflorescence, this umbelliform; clusters of spikelets short and congested to open and elongate, the terminal sessile, the others on rays to 10 cm long; spikelets slender, 0.5–2 cm long, 1–2 mm wide, with ca 12–28 flowers; rachilla narrowly hyaline-winged; scales 2–3 (4) mm long, several-nerved, overlapping ca 1/2 their length, deciduous at maturity; stamens 3; styles 3–branched ca 1/2–3/4 their length; achene unequally trigonous, 1.3–2 mm long; n = 48?, 54, 104. Weedy in areas of cultivation at ca 1230 m in Davis and Grand counties; widespread in tropical and warm temperate regions; 2 (0).

Cyperus schweinitzii Torr. Plants perennial, 10–34 cm tall, from short, thick rhizomes; culms triangular, somewhat bulbous-based, commonly antrorsely scabrous especially above; leaves few to several, mostly on the lower 1/4 of the culm, the blades elongate, ca 1–4 mm wide; involucre bracts commonly 3 or 4, unequal, to 10 cm long; terminal cluster of spikelets sessile, the others on rays to 7 cm long, the clusters ovoid to oblong; spikelets 5–10 mm long, compressed, ca 2 mm wide, with ca 5–8 flowers; scales 3–4 mm long, striate nerved, each one overlapping the next directly above ca 1/2 its length, deciduous at maturity, the midrib commonly excurrent as a tiny mucro; rachilla narrowly hyaline-margined; stamens 3; style 3–branched to near the base; achenes equally trigonous, 2–2.5 mm long; 2n = 80. Dunes and sandy soil in rabbitbrush-yucca and black sagebrush-juniper communities at 1735 to 1980 m in Kane County (near Kanab); Ontario to Texas and Mexico, and northern Idaho; 6 (0).

Eleocharis R. Br.

Annual or perennial plants; culms angular, flattened, or terete; leaves reduced to bladeless sheaths, or the sheaths bristle-tipped, basal or nearly so; spikelet solitary and terminal; involucre bracts lacking; scales spirally arranged, the lower empty or with flowers (in the *E. acicularis* group); flowers perfect; perianth lacking or of bristles, these up to ca 10; stamens 3 (or fewer); styles 2 or 3 or with 2 or 3 branches, thickened toward the base, the thickened part persistent on the achene as a tubercle, this confluent with or sharply differentiated from the body; achenes lenticular to more or less trigonous.

- 1. Stigmas 2 2
- Stigmas 3 3
- 2(1). Plants perennial, our most common and widespread spikerush; spike linear-lanceolate; achenes with a distinct tubercle, this constricted at the base and as high as wide or higher *E. palustris*
- Plants annual, rare; spike ovate-lanceolate; achenes with a flattened tubercle, this with a broad base and wider than high *E. ovata*
- 3(1). Tubercle constricted at the base, more or less forming a cap on the achene or wider than high 4
- Tubercle not constricted at the base, confluent with and not forming a cap on the achene, as high as or higher than wide 7
- 4(3). Achenes whitish or pale gray, longitudinally many-ribbed and with numerous cross corrugations forming ladderlike configurations; spikelets 2.5–9 mm long, with 3–15 flowers; culms very slender, ca 0.2 mm thick, not over 12 cm tall 5

- Achenes yellowish, golden brown, or blackish in age, 3–ribbed, cellular roughened but without cross corrugations; spikelets sometimes over 9 mm long and/or with more than 15 flowers; culms slender but mostly over 0.2 mm thick, 5–30 cm tall 6
- 5(4). Plants perennial, with very slender rhizomes, widespread in Utah; anthers 0.7–1.3 mm long; spikes 2.5–9 mm long *E. acicularis*
- Plants annual, without (rarely with) rhizomes, known from Washington County where rarely collected; anthers 0.2–0.4 mm long; spikelets 1.5–3 mm long. *E. bella*
- 6(4). Tubercle wider than high, not noticeably constricted at the base, but forming a broad low apiculate crown on the achene; spikelet ca 2–3 times longer than wide, 3–8 mm long; leaf sheaths with an entire collar; plants rarely collected, mostly known from the northeastern and east-central part of the state *E. bolanderi*
- Tubercle as high as or higher than wide, noticeably constricted at the base and forming a cap on the achene; spikelet ca 3–7 times longer than wide, 5–16 mm long; leaf sheaths, at least some, usually with a mucronate collar, the mucro to 0.6 mm long; plants widespread in the Great Basin and southern part of the state. *E. parishii*
- 7(3). Achenes 0.9–1.3 mm long; scales 1.5–2 (2.5) mm long plants 2–6 (10) cm tall, of low elevations; spikelet 2.5–4 (6) mm long *E. parvula*
- Achenes 1.9–2.8 mm long; scales 2.5–5.5 mm long; plants various; of various elevations; spikelet diverse ... 8
- 8(7). Plants (1) 2–8 dm tall or taller, from ascending or vertical stout rhizomes; larger culms 1–2 mm thick, some of them arching and rooting from an apical bulbil (proliferous); spikelet 5–13 mm long, with (5) 10–20 (25) flowers *E. rostellata*
- Plants 5–15 (20) cm tall, either with slender rhizomes or these lacking; culms to ca 1 mm thick, neither arching nor proliferous; spikelet 4–8 mm long, usually with 3–9 flowers 9
- 9(8). Leaf sheaths entire; scales entire, soon dark purple to purple black; perianth bristles minutely retrorsely barbellate; culms arising singly or few together from slender, creeping rhizomes; plants widespread. *E. pauciflora*
- Leaf sheath, at least the uppermost, of some culms with a bristlelike leafblade 4–6 mm long; lowest scale with a blunt awn 1–3 mm long, the scales greenish, pale in age; perianth bristles smooth; culms densely tufted; rhizomes lacking; plants of the Uinta Mts. *Scirpus caespitosus* (q.v.)

Eleocharis acicularis (L.) R. & S. Plants perennial, 2–15 (20) cm tall, culms 0.3–0.5 mm thick, tufted, from very slender rhizomes, usually with a solitary sheath ca 3–15 mm long; spikelet 2–8 mm long, with ca 4–25 flowers; scales (1.3) 1.5–2.2 mm long, blackish purple, typically with a green midstripe and hyaline margins; perianth bristles commonly 3 or 4, equaling or surpassing the achene or sometimes reduced or lacking; anthers 0.7–1.3 mm long; stigmas 3; achenes white to pale gray, rounded-trigonous, 0.7–1.1 mm long including the low-conic or more or less triangular-conic, basally constricted tubercle, with 8–18 longitudinal ribs, and with numerous cross corrugations connecting the ribs; 2n = 20. In mud and water, along streams, margins of ponds and lakes, and bogs and wet meadows, at (1310) 2190 to 3200 m in Beaver, Cache, Daggett, Duchesne, Garfield, Kane, Rich, Salt Lake, Sevier, Summit, Uintah, Utah, and Wasatch counties; circumboreal, south in America to Florida and Mexico; 23 (vii).

Eleocharis bella (Piper) Svenson Pretty Spikerush. [*E. acicularis* var. *bella* Piper]. Plants annual but forming dense tufts and appearing perennial, rarely with slender rhizomes, 1–8 cm tall; culms ca 0.2 mm thick, usually with a solitary short sheath; spikelet 1.5–3 mm long, with 3–15 flowers; scales 1–1.3 mm long, with a green or pale midstripe and hyaline margins and sometimes with dark purplish strips flanking the green midstripe; perianth bristles lacking; anthers 0.2–0.4 mm long; stigmas 3; achenes white or nearly so, rounded trigonous, with several longitudinal ribs and numerous cross corrugations connecting the ribs, these forming ladderlike configurations, 0.6–0.8 mm long including the low-conic basally constricted tubercle. Margins of ponds and lakes and other wet places in a pinyon-juniper community at ca 1830 m in Washington County (south of Enterprise, Atwood & Higgins 5901 BRY); Washington to Idaho, south to California and New Mexico; 1 (0).

Eleocharis bolanderi Gray Plants perennial, 8–30 cm tall; culms ca 0.5 mm thick, closely clustered on short rhizomes, often purplish at the base, usually with 1 or 2 sheaths, the upper sheath extending 1.5–3 cm on the culm; spikelet 3–8 mm long, ca 2–3 times longer than wide, with 10–25 flowers; scales usually 1.8–2.7 mm long, blackish or black purple, with a pale hyaline tip, lacking a pale midstrip or this rather faint; perianth bristles 3 or 4, reddish brown, minutely retrorsely barbellate, shorter than the achene; stigmas 3; achenes unequally trigonous, ca 1.5 mm long, greenish yellow at first, golden yellow at maturity, perhaps blackish in age, minutely cellular roughened, the tubercle not constricted at the base, depressed conic and apiculate. Moist and wet meadows at 2475 to 2590 m in Cache, Daggett, Duchesne, Grand, San Juan, Summit, and Washington counties; Oregon to California east to Idaho; 11 (v).

Eleocharis flavescens (Poir.) Urban Yellow Spikerush. [*Scirpus flavescens* Poir.]. Plants perennial, tufted, with slender rhizomes, 3–15 cm tall; leaf sheaths membranous, whitish, prolonged, many of them free from the culms; spikelet 2–6 mm long, ovate, with fewer than 20 flowers; scales purplish brown with a paler midvein; bristles 6–7, white, equaling or slightly longer than the achene; achenes glossy, purplish brown, the surface minutely punctate, ca 1 mm long; tubercle conic, acute. Moist places in Cache County; South America, West Indies, and north to the southern U. S., introduced in California and isolated stations in Wyoming and Montana; 1 (0).

Eleocharis ovata (Roth) R. & S. [*Scirpus ovatus* Roth]. Plants annual; culms few to several from fibrous roots, ca 0.5–1 mm thick, several-ribbed, with 1 or 2 sheaths, the upper sheath extending ca 4.5 cm up the culm; spikelet (2) 5–13 mm long, ovoid, usually with more than 40 flowers; scales usually 1.7–2.5 mm long, purplish or brownish, with a greenish midstripe and hyaline margins; bristles 6 or 7, brownish, retrorsely barbellate, subequal to or exceeding the achene, or reduced or lacking; anthers 0.3–0.8 mm long; stigmas 2 or occasionally 3; achenes lenticular, 1–1.5 mm long, smooth, straw colored to dark brown, the tubercle depressed conic, not conspicuously constricted at the base. Shore of Utah Lake, Utah County (Brotherston 2756 BRY); widespread in the Northern Hemisphere; 1 (0).

Eleocharis palustris (L.) R. & S. Creeping Spikerush. [*Scirpus palustris* L.; *E. calva* Torr.; *E. macrostachya*

Britt. ex Small]. Plants perennial, 1–7 (10) dm tall; culms arising singly or few together or more or less tufted, from slender creeping rhizomes, 0.5–3 (4) mm thick, usually with 2 sheaths, at least the lower one usually reddish or dark purple, the upper one extending up to ca 2–15 cm on the culm; spikelet 5–25 mm long, linear to lance-ovate in outline, with several to many flowers; scales 2–4.5 mm long, brownish purple, with a greenish midstripe and hyaline margins, the lower 1 or 2 empty; perianth bristles 4 (5 or 6), retrorsely barbellate, a little longer than the achene or sometimes reduced or lacking; anthers 1.3–2.5 mm long (dry); stigmas 2; achenes lenticular, green yellow, yellow, or medium brown, finely cellular-roughened, ca 1.5–2.5 mm long including the tubercle; tubercle constricted at the base, rather elongate-conic, 0.4–0.7 mm long; $2n = 14, 16, 18, 38$. Margins of ponds and lakes, along streams, in swampy meadows, and other wet places at 1135 to 3200 m in all Utah counties; widespread in the Northern Hemisphere; 140 (x).

Eleocharis parishii Britt. Plants perennial, 7–40 cm tall; culms ca 0.3–1 mm thick, tufted, arising singly, or few together, from slender rhizomes; sheaths usually 2, often reddish or purplish at least in part, the upper one extending (1) 1.5–4.5 cm up the culm, usually at least a few of them ending in a mucro to 0.8 mm long; spike 5–16 mm long, ca 3–7 times longer than wide, with ca 20–40 flowers; scales usually 2.4–3 mm long, purplish or brownish purple, usually with a green or pale midstripe and hyaline margins, the lowest one tending to be shorter, broader, and empty; perianth bristles usually 6 or 7, white or brown, retrorsely barbellate, longer or shorter than the achene; stigmas 3; achene plano-convex or unequally trigonous, greenish yellow when young, yellow or brownish to blackish when mature, 1–1.2 mm long, the tubercle more or less elongate-conic, much like that of *E. palustris* but perhaps not quite so noticeably constricted at the base. Margins of ponds, lakes, seeps and springs, wet and swampy meadows, along streams, and other wet places at 775 to 2200 (2700) m in Beaver, Cache, Davis, Juab, Kane, Millard, Salt Lake, San Juan, Sanpete, Tooele, Utah, Washington, and Weber counties; Oregon south to California and New Mexico; 22 (i).

Eleocharis parvula (R. & S.) Link ex Bluff & Fingerh. [*Scirpus parvulus* R. & S.]. Plants perennial, from very slender inconspicuous rhizomes, 2–7 (10) cm tall; culms ca 0.5–1 mm thick, densely tufted, sometimes forming mats, usually with only 1 sheath, this to ca 1 cm long; spikelet 2.5–5 mm long, with 2–9 (20) flowers; scales 1.5–2 (2.5) mm long, the lowest one empty; stigmas 3; achenes 0.9–1.3 mm long, usually unequally trigonous; tubercle confluent with the achene, not constricted, very short. Usually in mud of drying margins of ponds and lakes or on flood plains at 1250 to 1770 m in Millard, Salt Lake, Uintah, Utah, and Weber counties; British Columbia to Newfoundland, south to South America; Europe; 10 (iii).

Eleocharis pauciflora (Light.) Link [*E. quinqueflora* (Hartman) Swartz]. Plants perennial, 7–20 (30) cm tall; culms 0.2–1 mm thick, arising singly or few together or occasionally tufted, from slender rhizomes, usually with 1 or 2 sheaths, these entire, pale or reddish, the upper one extending 1–2 cm up the culm; spikelet 4–8 mm long, with ca 3–9 flowers; scales 2.5–5.5 mm long, commonly purplish to purple black, with hyaline margins, often without a green or pale midstripe, the lowest 2 or 3 from

1/2–3/4 as long as the spikelet or longer; perianth bristles equaling or exceeding the achene or sometimes reduced, finely retrorsely barbellate; stigmas 3; achenes 1.9–2.6 mm long, equally or unequally trigonous or plano-convex, broadest above the middle; tubercle confluent with the achene, not constricted, higher than wide; $n = 68$. Wet and boggy meadows and along streams at 2080 to 3385 m in Box Elder, Cache, Daggett, Duchesne, Emery, Garfield, Juab, Kane, Salt Lake, Sanpete, Sevier, Summit, Uintah, Utah, Wasatch, and Wayne counties; circumboreal, south in America to California and New Jersey; 40 (xv). This species is sympatric with *Scirpus caespitosus* (q.v.) in the Uinta Mts.

***Eleocharis rostellata* (Torr.) Torr.** [*Scirpus rostellatus* Torr.]. Plants perennial, (1.5) 4–8 (10) dm tall; culms usually 1–2 mm thick, few together or densely clustered, from a thick, ascending or nearly vertical rhizome, some of the culms often arching and rooting from an apical bulbil (proliferous); sheaths usually 2 per culm, brownish or occasionally reddish or purple, the upper one extending ca 2–8 cm up the culm; spikelet (5) 8–11 mm long, with (5) 10–20 (25) flowers; scales purplish to black purple, with broad pale hyaline margins, with or without a green or pale midstripe, ca 3–4 mm long; lowest scale a little larger than the others, rarely over 1/2 as long as the spikelet, empty; perianth bristles somewhat shorter to a little longer than the achene, retrorsely barbellate; stigmas 3; achenes 1.9–2.8 mm long, rounded trigonous to plano-convex, smooth or slightly cellular-roughened, greenish, the tubercle confluent with the body of the achene, not constricted, medium to high conic. Wet meadows, marshes, ditches and streams, and seeps and springs (often where alkaline) at 1280 to 2255 m in Beaver, Cache, Duchesne, Emery, Garfield, Iron, Juab, Kane, Millard, Salt Lake, San Juan, Sanpete, Summit, Tooele, Utah, and Wasatch counties; British Columbia to Nova Scotia, south to South America; 37 (v). The arching vegetative stems rooted at both ends, and catching one's feet when walking, are unique among the Utah flora.

***Eriophorum* L.**

Perennial grasslike plants with mostly solid culms; leaf sheaths closed, the blades grasslike or the upper ones sometimes lacking; bracts subtending the inflorescence scalelike to leaflike; spikelets 1 to several in a terminal inflorescence; scales of spikelets spirally arranged, not awned; perianth of numerous persistent bristles, these elongate at least in fruit and forming a cottonlike tuft; stamens 3; styles 3; achenes unequally trigonous, with a usually slender apiculate tip.

1. Spikelets (2) 3–6 (8), mostly on slender peduncles; lowest bract more or less leaflike, 2.5–5.5 cm long; leaf blades well developed, mainly 2–6 mm wide; anthers commonly 2.5–4 mm long *E. polystachion*
- Spikelet solitary, sessile; bracts scalelike, less than 1 cm long; leaf blades ca 1 mm wide, often reduced or lacking; anthers commonly 0.5–1 mm long *E. scheuchzeri*

***Eriophorum polystachion* L.** Tall Cottongrass. [*E. angustifolium* Honck.]. Plants perennial, 20–60 cm tall; culms mostly arising singly, from long creeping rhizomes; leaf blades usually well developed, mainly 2–6 mm wide, flat or narrowed and channeled to triangular distally; lowest involucre bract more or less leaflike, 2.5–5.5 cm long, often dark purple, at least toward the base, the

upper bracts much smaller; spikelets (2) 3–6 (8), mostly on slender peduncles to 2.5 cm long, or rarely sessile or nearly so, in an umbellate inflorescence; scales greenish, brownish, or purplish, with hyaline margins; perianth bristles numerous, white, forming cottonlike tufts 2–3.5 cm long; achenes blackish, 2–3 mm long, oblanceolate to obovate; $2n = 58, 60$. Wet meadows and bogs in spruce-fir and lodgepole pine forest openings at 2740 to 3385 m in Daggett, Duchesne, and Uintah counties; circumboreal, south in America to Oregon, New Mexico, and New York; 7 (iv).

***Eriophorum scheuchzeri* Hoppe** White Cottongrass. Plants perennial, 13–40 cm tall; culms mostly arising singly from long creeping rhizomes; leaf blades to 8 cm long and 1 mm wide, channeled or triangular, often much reduced or lacking especially the upper one; involucre bracts scalelike, 3–8 mm long, blackish or black purple; fertile scales blackish, with broad white hyaline margins, acute; perianth bristles numerous, white, forming cottonlike tufts 2–3.5 cm long; achenes brown or blackish ca 2 mm long. Wet meadows, margins of lakes, and other wet places in lodgepole pine, spruce-fir, and alpine tundra at 3350 to 3810 m in Duchesne, Summit, and Uintah counties; circumboreal, south in America to Colorado, and Newfoundland; 10 (i).

***Fimbristylis* Vahl**

Grasslike plants with triangular culms; leaves basal or nearly so; spikelets several to many in terminal, simple or compound umbellate cymes subtended by sheathless bracts; scales spirally arranged; flowers perfect; perianth lacking; stamens 1–3; style lobed, enlarged toward the base.

***Fimbristylis spadicea* (L.) Vahl** [*Scirpus spadiceus* L.]. Plants perennial, 20–90 cm tall; leaves basal and on the lower 1/5 of the culms, the sheaths more or less closed, glabrous or pubescent, the ventral side membranous, often with minute brownish or reddish spots, the blades 1–4 mm wide; inflorescence simple or more often compound, with the terminal spikelet sessile and subtended by an involucre bract, the lateral spikelets on rays or peduncles mainly 1–7 cm long; spikelets 8–23 mm long, 3–5 mm thick, elliptic-cylindrical, many-flowered; scales 3–5 mm long, usually ciliate to pubescent over the back, reddish brown or grayish, the midrib lighter and prolonged into a mucro or short awn; stamens 3; style 2-lobed ca 1/4 the length; achenes ca 1.5 mm long, obovate, minutely apiculate, finely many-ribbed and cross-rugulose; $n = 10$. Hanging gardens, wet meadows, margins of ponds and lakes, and along streams, tolerant of alkali, at 850 to 1375 m in Kane, Millard, San Juan, Utah, and Washington counties; tropical America north to California and New York; 6 (0).

***Kobresia* Willd.**

Plants perennial, densely caespitose, grasslike; stems obtusely triangular, solid; leaves with closed sheaths and narrow blades; inflorescence of 1 to several spikes with few to several spikelets; scales spirally arranged; flowers imperfect, without a perianth, arranged in small spikelets; achenes subtended by 2 small bracts, the lower bract corresponding to the lower bracteate scale in *Carex* and the inner bract corresponding to the perigynium but with unsealed margins and exposing the achene; stamens 3; stigmas 3.

- 1. Spike solitary, 1–2 cm long; plants 5–20 cm tall, of exposed, alpine ridges at or above 3200 m *K. bellardii*
- Spikes (1) 3–12, 0.5–1.5 cm long; plants 25–35 cm tall, of wet or boggy, subalpine meadows below 3200 m *K. simpliciuscula*

***Kobresia bellardii* (All.) Degl. [*Carex bellardii* All.; *C. myosurioides* Vill.; *K. myosurioides* (Vill.) Fiori & Paoli].** Plants 5–20 cm tall, caespitose; leaves basal and on the lower stem, the blades tightly involute or channeled, wiry, ca 0.4–0.8 mm wide; spike solitary, 1–2 cm long, 2–3 mm wide, the terminal flower staminate, the lateral ones mostly androgynous, occasionally pistillate; scales 3–4 mm long, brownish, largely scarious; achenes ca 2.5 mm long, brownish with a darker, persistent, apiculate style base; 2n = 36?, 58. Alpine tundra communities, rock stripes, and talus at 3200 to 3630 m in Daggett, Duchesne, and Summit counties; circumboreal, south in North America to California and Newfoundland; 15 (i). This plant and *Carex elymoides* (q.v.) are habitually and ecologically similar, and they are rather easily mistaken.

***Kobresia simpliciuscula* (Wahl) Mack. [*Carex simpliciuscula* Wahl].** Plants perennial, 25–35 cm tall, densely caespitose, without rhizomes; leaves basal and on the lower 1/5 of the stems, the sheaths open and with scarious margins, the blades flat or strongly folded, 0.5–1.2 mm wide; spikes (1) 3–12, 5–15 mm long; sessile or occasionally short-pedunculate; spikelets usually with a pistillate and a staminate flower; scales 3–3.5 mm long, brownish or greenish brown, largely scarious; achenes 2–3 mm long; 2n = 72–76. Boggy, mostly calcareous meadows at 2590 to 2805 m in Daggett, Duchesne and Emery counties; circumboreal and south in western North America to Idaho and Colorado; 4 (ii).

***Scirpus* L.**

Annual or perennial plants; leaves reduced to bladeless sheaths or with well-developed blades; involucre of 1 to many scalelike or leaflike bracts; spikelets solitary to numerous in a capitate, umbellate, or paniculate inflorescence; scales of spikelets spirally arranged, with or without an excurrent awn; flowers perfect; perianth of 1–6 bristles, these sometimes obsolete; stamens 3 (rarely fewer); stigmas 2 or 3; achenes lenticular or trigonous, with or without a stylar apiculus, but without a tubercle.

- 1. Spikelet solitary; involucre of 2 or 3 modified empty scales less than 1 cm long; plants 4–20 cm tall, perennial, densely tufted, of the Uinta Mts. *S. caespitosus*
- Spikelets 2 to many; involucre of 1 to several more or less leaflike bracts; plants various but often taller, of lower elevations 2
- 2(1). Plants annual, tufted, from fibrous roots, 3–25 cm tall; achenes dark gray brown to blackish, conspicuously cross-ridged *S. supinus*
- Plants perennial, from rhizomes, often over 25 cm tall; achenes mostly lighter, not cross-ridged 3
- 3(2). Involucre with 2 or more foliose, spreading bracts 4
- Involucre with only 1 foliose bract, this erect or nearly so 7
- 4(3). Spikelets mostly 3–6 mm long and over 100 in an open umbellate inflorescence 5
- Spikelets mostly 10–35 mm long and 3–40 (rarely more) in a compact or somewhat open umbellate inflorescence 6

- 5(4). Stigmas 2; midrib of scales abruptly contracted into a short mucro; leaf sheaths mostly anthocyanic; plants widespread *S. microcarpus*
- Stigmas 3; midrib of scales tapered into a short awn; plants of the Uinta Basin and Utah County *S. pallidus*
- 6(4). Stigmas 2; spikelets 3–25, all in a sessile cluster or also with 1–4 additional clusters borne on peduncles to 6 cm long; plants common, widespread *S. maritimus*
- Stigmas 3; spikelets commonly 10–40, at least a few usually borne singly, the inflorescence typically umbellate with few to several raylike peduncles to 7 cm long; plants rare, known from Box Elder, Cache, and Daggett counties *S. fluviatilis*
- 7(3). Inflorescence open, with conspicuous branches; spikelets numerous, more than 20; culms terete, commonly 1 cm or more in diameter, 8–30 dm tall; leaves reduced to bladeless sheaths or the blades short and erect or nearly so 8
- Inflorescence headlike, with the sessile spikelets in a sessile cluster; spikelets 3–15; culms triangular or, if subterete, usually with well-developed ascending-spreading leaf blades, commonly less than 1 cm in diameter, 1–16 dm tall 9
- 8(7). Spikelets appearing dull orange or reddish brown, the scales with striolae about the same color as the rest of the scale; scales mostly 2–3 (3.5) mm long; plants rather uncommon *S. validus*
- Spikelets appearing dull gray brown, the scales with prominent red brown striolae that contrast with the gray white color of the rest of the scale; larger scales mostly 3.5–4 mm long; plants common *S. acutus*
- 9(7). Achenes entire at the apex, not apiculate; scales mostly entire at the apex, the midrib hardly (if at all) exerted; culms subterete *S. nevadensis*
- Achenes apiculate; scales notched at the apex, the midrib extending between the notch as an awn or awn-point; culms obtusely to sharply triangular 10
- 10(9). Culms sharply triangular, ridged or winged on the angles, conspicuously concave on the sides, (4) 5–16 dm tall; leaf blades to 10 cm long, rarely longer; scalelike bracts lacking; plants mainly of the Great Basin *S. americanus*
- Culms subterete to sharply triangular but not concave on the sides, commonly less than 5 dm tall or, if taller, the longest leaf blade mostly over 10 cm long; scalelike bracts 1–2; plants widespread *S. pungens*

***Scirpus acutus* Muhl. ex Bigelow** Hardstem Bulrush. Plants perennial, commonly 10–30 dm tall, from robust rhizomes; culms terete, ca 5–20 (30) mm thick; leaves borne on the lower 1/4 of the culms, reduced to bladeless sheaths, or the upper one with a blade up to 12 cm long; inflorescence compact, subumbellate, subtended by greenish involucre bract that simulates a continuation of the culm, this commonly shorter than or equaling the inflorescence, rarely longer, also with additional inconspicuous bracts; spikelets usually numerous, more or less grayish or gray brown, commonly 8–15 mm long, solitary or 2 to several; lower scales (3) 3.5–4 mm long, mostly gray hyaline except for the greenish midrib, the gray hyaline background sharply contrasting with reddish brown striolae, the margins ciliolate or lacerate; perianth bristles retrorsely barbellate, subequal to or slightly exceeding the achene; styles 2-branched for ca 3/4 their length; achenes 2.2–2.5 mm long, plano-convex, more or less completely hidden by the scales; 2n = 36. Margins of ponds and lakes, marshes and swamps, seeps, springs,

washes, and flood plains at 1097 to 2200 m in all Utah counties except Beaver, Iron, Morgan, Summit, and Wasatch; temperate North America; 75 (viii). This species apparently intergrades with *S. validus* q.v.

Scirpus americanus Pers. Olney Threesquare. [*S. olneyi* Gray]. Plants perennial, (4) 5–16 dm tall, from robust rhizomes; culms very sharply triangular, ridged or winged on the 3 angles, conspicuously concave on the sides, easily flattened in pressing, mostly thicker than in *S. pungens*, commonly 5–10 mm thick toward the base; leaves commonly 1–4, borne on the lower 1/3 of the culms, the lower ones often reduced to bladeless sheaths, the upper ones with blades to 10 cm long, the blades usually strongly folded, to 6 mm wide when pressed, very gradually tapered; involucre bract solitary, 1–3.5 (5) cm long, commonly 1–3 times longer than the inflorescence, appearing as a continuation of the culm; involucre bracts lacking; spikelets 2–15, sessile, usually 6–15 mm long, scales yellowish brown, reddish brown, or purplish brown, rather hyaline, the midrib firm distally and commonly exerted as a mucro, the mucro subequal to the notch of the scale; perianth bristles 4 (5–6), usually retrorsely barbellate; styles 2; achenes 2–3 mm long including the apiculus, 1.4–1.7 mm wide, plano-convex; $n = 39?$ Swamps, marshes, seeps, springs, margins of ponds and lakes, wet alkaline meadows, and saltgrass-greasewood communities at 730 to 1510 m in Box Elder, Cache, Davis, Juab, Millard, Salt Lake, Sanpete, Tooele, Utah, Washington, Wayne, and Weber counties; Nova Scotia to Washington, south to South America; 33 (iii). This species is much less common than *S. pungens*, for which it is occasionally mistaken.

Scirpus caespitosus L. Deerhair Bulrush. Plants perennial, 4–20 cm tall, densely tufted, with very short rhizomes; culms subterete, ca 1 mm thick, clothed at the base with persistent leaf sheaths; basal leaves reduced to bladeless sheaths, the upper borne on the lower 1/5 of the culm, this commonly with a rudimentary blade 4–7 mm long; inflorescence of a solitary, terminal spikelet 4–6 mm long, this light to medium brown; involucre of 2 or 3 empty scales, these usually deciduous in age, the lowest scale with a blunt awn 1–3 mm long, the awn subequal to the spikelet; perianth bristles 6, white, smooth, a little longer to twice as long as the achene; achenes trigonous, ca 1.5 mm long; $n = 52?$ Boggy and peaty meadows at 2895 to 3415 m in Duchesne, Summit, Uintah, and Wasatch counties; circumboreal, south in North America to North Carolina and Oregon; 15 (viii). This bulrush is sympatric with *Eleocharis pauciflora* in the Uinta Mts., but perhaps it is less tolerant of permanently saturated soil.

Scirpus fluvialis (Torr.) Gray River Bulrush. [*S. maritimus* var. ? *fluvialis* Torr.]. Plants perennial, commonly 6–15 dm tall, from robust rhizomes; culms sharply triangular, often with concave sides; leaves commonly 3–5, well distributed on the lower 1/2–3/4 of the culm, mostly with well-developed flat blades to 50 cm long and 6–15 mm wide; leaflike involucre bracts usually 3–5, to 35 cm long and 7 mm wide, flat; inflorescence of few to several raylike peduncles to 7 cm long, each with a cluster of (1) 2–5 spikelets; some spikelets with empty scalelike bracts at the base, these often entire apically; spikelets commonly 10–40, 10–18 mm long, 6–10 mm thick; scales tan or light brown, scarious, hirtellous on the back, the midrib excurrent as an awn, the awn commonly 2–5 times longer than the apical notch of the scales, often recurved;

perianth bristles 6, retrorsely barbellate, often equaling the achene; styles 3-branched for ca 1/3 their length; achenes trigonous, 3.5–5 mm long; minutely cellular-reticulate; $2n = 94$. Riparian and marsh communities at 1382 to 1650 m in Box Elder, Cache, and Daggett counties; widespread but irregularly distributed in Canada and the U. S.; 5 (0).

Scirpus maritimus L. Alkali Bulrush. [*S. paludosus* A. Nels.]. Plants perennial, 2–15 dm tall, from robust rhizomes, these commonly bearing tubers; culms sharply triangular, often with concave sides, 3–13 mm thick toward the base; leaves commonly 4–8, borne on the lower 1/2 (3/4) of the culm, mostly all with well-developed folded or flat blades (5) 10–40 cm long or longer and to 1 cm wide, the lower 1 or 2 sometimes reduced to bladeless sheaths; leaflike involucre bracts 2 or 3 (1–4), the longest one usually much exceeding the others and to 34 cm long; scalelike involucre bracts usually few to several, the larger ones commonly with the green midrib exerted as a caudate awn; spikelets 3–25 or rarely more, 10–35 mm long, 5–10 mm thick, all sessile in a compact cluster or 1–4 additional clusters borne on peduncles to 6 cm long; scales tan or light brown, rarely dark brown, scarious, minutely hirtellous on the back, the firm midrib exerted as a mucronate awn, this commonly 1–3 times longer than the apical notch of the scale; perianth bristles few, minutely retrorse-barbellate, ca 1/4–1/2 (3/4) as long as the achenes; styles 2-branched for ca 1/3 the length; achenes lenticular, 2.5–4 mm long, minutely cellular reticulate; $n = 55$; $2n = 40, 90?$ Marshes, lakes and ponds, ditches, streams and rivers, mud flats, seeps, and alkaline meadows at 840 to 2075 m in all Utah counties, except Beaver, Daggett, Iron, Morgan, Piute, Wasatch, and Wayne; widespread in the Northern Hemisphere; 80 (xiii).

Scirpus microcarpus Presl Panicled Bulrush. Plants perennial, (3) 6–15 dm tall, from robust rhizomes; culms obtusely triangular, 6–15 (20) mm thick toward the base; leaves well distributed on the stems, the sheaths often reddish purple in part, the blades well developed, flat, 15–60 cm long, 6–20 mm wide; leaflike involucre bracts 3–5, to 27 cm long; inflorescence a compound, umbellate, terminal cyme; spikelets very numerous, 3–6 (8) mm long, borne in small clusters of mostly 5–20 at the ends of rather slender branches or some of the clusters sessile; scales with a green midrib and broad scarious margins, flecked with dark purple and appearing greenish black, the midrib hardly, if at all, exerted as a mucro; perianth bristles 4–6, rather sparsely retrorsely barbellate, subequal to the achene; styles 2-branched for ca 1/2–3/4 their length; achenes lenticular, ca 1 mm long; $n = 33$; $2n = 67$. Banks of streams and canals, and in meadows, at 1370 to 2890 m in Box Elder, Cache, Daggett, Davis, Duchesne, Garfield, Juab, Piute, Salt Lake, San Juan, Sevier, Uintah, Utah, Wasatch, Washington, and Weber counties; Canada south to California and West Virginia; 39 (viii).

Scirpus nevadensis Wats. Nevada Bulrush. Plants perennial, 1–5 dm tall, with creeping rhizomes; culms subterete; leaves few to several, clustered near the base of the culms, the lower ones sometimes reduced to bladeless sheaths, the upper ones with channeled or flat blades to 20 cm long and 1–3 mm wide; leaflike involucre bract solitary, 1.5–7 cm long; scalelike involucre bracts 1 or more, sometimes with the firm midrib exerted as an awn shorter than the body; spikelets (1) 2–10, sessile in a

compact cluster, 1–2 cm long; scales shining brown, with white, hyaline, sometimes ciliate margins, the apex entire, the midrib firmer than the body and greenish, not exerted as a mucro; perianth bristles 1–3 (4), retrorsely barbellate, mostly less than 1/2 as long as the achene; styles 2-branched for ca 1/2 their length or less; achenes plano-convex, ca 2 mm long, cellular-reticulate, not at all apiculate. Moist alkaline meadows at ca 1315 m in Juab County; Washington to Saskatchewan, south to California and Wyoming; Argentina; 1 (i).

Scirpus pallidus (Britt.) Fern. [*S. atrovirens* var. *pallidus* Britt.]. Plants perennial, 4–15 dm tall, from robust rhizomes; culms triangular, 6–15 (20) mm thick toward the base; leaves cauline, the sheaths not marked with reddish purple, the blades well developed, flat, commonly 20–60 cm long, 6–20 mm wide; leaflike involucre bracts commonly 3–5, mostly 3–15 cm long or longer; inflorescence a compound, umbellate, terminal cyme; spikelets very numerous, 3–4 mm long, borne in sessile or pedunculate clusters averaging larger than in *S. microcarpus*, ca (20) 40 or more per cluster; scales with a green midrib and scarious margins flecked with dark purple and appearing greenish black, the midrib exerted as a short mucro; perianth bristles mostly 6, minutely retrorse-barbellate above the middle, subequal to or shorter than the achene; achene trigonous, with the ventral side the widest, ca 1 mm long. Along ditches, canals, and streams at 1370 to 1710 m in Uintah and Utah counties; Washington to Minnesota, south to Texas and Missouri; 11 (vii).

Scirpus pungens Vahl Common Threesquare. [*S. americanus* Pers. misapplied]. Plants perennial, 1.3–11.6 dm tall, from robust rhizomes; culms subterete to sharply triangular, the sides not concave, 2–5 (7) mm thick; leaves commonly 2–4, borne on the lower 1/3 of the culms, the lower ones often reduced to bladeless sheaths, the upper ones with blades commonly (5) 8–25 (38) cm long, the blades flat to involute, 0.5–4 mm wide, linear, well developed; leaflike involucre bract solitary, rarely 2, 2–11 cm long, commonly 3–7 times longer than the inflorescence, more or less appearing as a continuation of the culm, accompanied by 1 or 2 smaller, empty, scalelike bract(s), these often blackish purple and usually with an awn from ca 1/3 to as long as the body; spikelets 1–6, sessile or essentially so in a compact cluster, commonly 7–20 mm long; scales yellowish brown to reddish brown, some (especially the lower ones) often blackish purple, rather scarious, the midrib prominent and exerted as a mucro, the mucro equal to or a little longer than the apical notch of the scale; perianth bristles 4–6, retrorsely barbellate; styles 2 or 3; achenes lenticular or trigonous, 2.2–3.3 mm long including the conspicuous apiculus, 1.6–2.3 mm wide; $n = 39?$; $2n = 74$. Tolerant of alkali, along flood plains, ditches, and streams, seeps, springs, margins of ponds and lakes, and in marsh, swamp, and lowland meadow communities at 850 to 2290 m in all Utah counties, except Morgan and Summit; Canada to South America, Europe, Australia, and New Zealand; 95 (xiii). Unfortunately, the name *S. americanus* has generally been misapplied to this species. While plants of the two taxa are apparently closely related, they are strikingly different in the field. Our plants are referable to var. *longispicatus* (Britt.) Cronq. [*S. americanus* var. *longispicatus* Britt.].

Scirpus supinus L. Sharpshank Bulrush. Plants annual, tufted, 2–25 cm tall, from fibrous roots; culms decumbent

to erect; leaves few, mostly on the lower 1/2 of the culms, reduced to bladeless or bristle-tipped sheaths, or the upper ones with short blades or the blades rarely elongate and to 5 cm long; principal involucre bract solitary, erect to somewhat incurved, ca 2–10 cm long, more or less simulating a continuation of the culm, smaller bracts borne at the base of the spikelets, these inconspicuous or to 3 cm long; spikelets commonly 2–7, sessile or nearly so or some conspicuously short-pedunculate; scales hyaline except for the greenish, short-excurrent midrib; perianth bristles present or lacking; style branches 3; achenes unequally trigonous, the ventral side the widest, ca 1.4 mm long, dark gray brown to blackish, conspicuously rugulose; $n = 14$. Shores of drying lakes and ponds, mud flats, and flood plains at 1380 to 1417 m in Millard, Salt Lake, and Uintah Counties; almost cosmopolitan, but rare and irregularly distributed; 4 (0).

Scirpus validus Vahl Softstem Bulrush; Tule. Plants perennial, commonly 8–12 dm tall, from robust rhizomes; culms terete, ca 5–10 (15) mm thick; leaves borne on the lower 1/4 of the culms, reduced to bladeless sheaths or the upper one with a mostly erect blade to 9 cm long and 4 mm wide; inflorescence commonly umbellate, subtended by a greenish involucre bract that simulates a continuation of the culm, this shorter or longer than the inflorescence, also with additional inconspicuous bracts; spikelets usually numerous, more or less orange brown or reddish brown, commonly 6–10 (15) mm long, borne singly or 2 or 3 together; scales (2) 2.5–3 (3.5) mm long, with red brown striolae that hardly, if at all, contrast with the red brown back ground color of the scales except on the sometimes pale hyaline margins, the margins entire or shortly fringed-ciliate to somewhat lacerate; perianth bristles retrorsely barbellate, subequal to the achenes, styles 2-branched for ca 3/4 their length; achenes ca 1.8–2.3 mm long, plano-convex, the margins usually not covered by the scales; $2n = 42$. Streams, ditches, canals, margins of ponds and lakes, flood plains of rivers, and marshlands, sometimes emergent in shallow water at 1220 to 1880 m in Box Elder, Carbon, Daggett, Duchesne, Emery, Grand, Kane, Uintah, Utah, and Wayne counties; temperate North America and into tropical America; 23 (iv). A number of our specimens apparently show intergradation with *S. acutus*, but the plants are quite distinct in the field.

GRAMINEAE A. L. Juss.

Grass Family

Contributed and edited by Lois A. Arnov

Perennial or annual herbaceous plants (more or less woody only in giant reeds and bamboos); stems (culms) terete or flattened, simple or branched, with swollen or depressed nodes that often differ from the internodes in color, the internodes hollow or less commonly pithy to solid; leaves alternate, 2-ranked, the lower portion (sheath) closed and tubular or more commonly open with membranous, usually overlapping margins, the lateral margins at the summit occasionally prolonged as small, acute to rounded appendages (auricles), the upper portion (blade) narrowly elongate, parallel-veined, flat or folded to involute, often scarious due to the presence of sharp-pointed siliceous spicules, the junction of the

sheath and blade on the abaxial surface (collar) usually marked by thickened tissues and a different coloration, on its adaxial surface nearly always giving rise to an appendage (ligule) consisting of a band of membranous tissue or a ring of hairs. Flowers (florets) small and inconspicuous, commonly wind-pollinated, bisexual or, in a few species, unisexual (sometimes proliferating as bulblets or some florets sterile or rudimentary), borne in few to numerous spikelets, these sessile or pedicelled at each node of a primary axis (rachis) or secondary axis (branch), the ultimate inflorescence a spike, raceme, or panicle based on the arrangement of the spikelets (not flowers) with the most mature spikelets toward the apex; each spikelet normally consisting of a pair of subopposite bracts (glumes) subtending 1–50 individual florets, these alternating on opposite sides of an axis (rachilla), the first glume (lower) sometimes reduced or lacking, rarely both glumes absent; each floret typically consisting of a pair of subopposite, usually dissimilar bracts, the margins of the outer bract (lemma) partially or completely enfolding the inner one (palea), these subtending 2 (3) minute scales (lodicules), the stamens, and the pistil; lemma either flattened to convex on the back (dorsiventrally compressed) or more or less folded (keeled) along the midnerve (laterally compressed), in some species the base of the lemma (or floret) prolonged and hardened to form a blunt to sharply acute, often bearded structure (callus); palea nerveless or (1) 2 (3) –nerved and thought by some to represent fused members of an ancestral trio of petals, the third member entirely suppressed; stamens usually (1 or 2) 3; pistil 1, the ovary 2 (3) –carpellate, superior, 1–loculed, 1–ovuled, glabrous or occasionally hairy, the styles 2 (3), each with a more or less featherlike stigma. Fruit a caryopsis having the pericarp fused with the seed coat, or sometimes are achene having the pericarp free of the seed coat, the seeds with a hard or soft, fairly large starchy endosperm and a small to large embryo lying toward one side. [Poaceae Barnh.]. Note: See additional grass references pp. 10–12.

Allred, K. 1982. Describing the grass inflorescence. *J. Range Management* 35: 672–675.
 Sutherland, D. 1986. Poaceae, in Great Plains Flora Association, *Flora of the Great Plains*. Univ. Press of Kansas. Lawrence, Kansas.

Note: The following key to the genera occasionally employs apparent rather than actual characters. Data pertaining to lemmas are taken from those of the lowermost floret in the spikelet, and that pertaining to ligules from those of the uppermost culm leaf. Nerves of the glumes and lemmas may be more accurately assessed from the ventral than the dorsal surface.

- 1. Inflorescence a small headlike cluster largely obscured by subtending leaf fascicles; plant a low, stoloniferous annual; leaves typically narrowly white-margined, flat, and 1–3 mm wide *Munroa*
- Inflorescence not headlike or, if so, not largely obscured by the leaves; plants not otherwise as above 2
- 2(1). Spikelets enclosed within a spiny bur or cuplike structure, not usually visible 3
- Spikelets not so enclosed, usually exerted at flowering 4
- 3(2). Spikelets enclosed within a spiny bur; plant a widely distributed weedy annual *Cenchrus*
- Spikelets enclosed within a lobed, cuplike structure; plant a rare, strongly stoloniferous perennial *Buchloe*

- 4(2). Spikelets dorsiventrally compressed (glumes or lemmas flattened to convex on the back), 1-flowered or in some species 2-flowered (the lower floret then reduced and the lemmas dissimilar), disarticulating below (and sometimes also above) the glumes, in a few species the rachis disarticulating below the sessile spikelet of a pair or trio Key 1, p. 685
- Spikelets terete to laterally compressed (the lemma rounded on the back to strongly keeled along the midnerve) or, if dorsiventrally compressed, the spikelets either more than 2-flowered or disarticulating above the glumes 5
- 5(4). Spikelets sessile, the inflorescence either a solitary terminal spike or made up of 1 to many, usually simple, 1-sided, spike-like branches, these variously arranged along the main axis [in *Hordeum* the lateral spikelets of a trio short-pedicelled; in *Bouteloua curtipendula* the branches very short (spike-like) and pendulous] Key 2, p. 686
- Spikelets pedicelled, the inflorescence a spike-like to open panicle (reduced to a single spikelet in *Danthonia unispicata*), the pedicels 0.2–50 mm long (plants with spike-like panicles in which some of the spikelets are sessile will key here) 6
- 6(5). Spikelets with a single well-developed floret, in several species with 1 or 2 (3) staminate or neuter to rudimentary florets above or below the perfect one, the lemmas then dissimilar Key 3, p. 687
- Spikelets with 2 to many florets, rarely the florets replaced by bulblets; lemmas often progressively smaller upward, otherwise similar 7
- 7(6). Glumes (at least the longer one) consistently equal to or longer than the body of the lowermost lemma, in some species surpassing all of the florets Key 4, p. 689
- Glumes (both) averaging shorter than the body of the lowermost lemma, sometimes only slightly so Key 5, p. 690

Key 1.

Spikelets dorsiventrally compressed (glumes or lemmas flattened to convex on the back), 1-flowered or occasionally 2-flowered (the lower floret then neuter or staminate and the lemmas dissimilar), disarticulating below (and occasionally also above) the glumes, in a few species the rachis disarticulating below the sessile spikelet of a pair or trio.

- 1. Spikelets in 3s at each node of a spicate inflorescence, the lateral spikelets often reduced; rachis disarticulating at each node (except in a cultivated annual); glumes awnlike throughout or nearly so *Hordeum*
- Spikelets diversely arranged on the rachis (occasionally in 3s at tips of branches); either the rachis continuous or the glumes not awnlike 2
- 2(1). Glumes thinner than the lemma of the fertile floret, the first glume sometimes reduced or lacking, the second then resembling the lemma of the lower sterile floret 3
- Glumes firmer than the lemma, in some species only in the sessile spikelet of a pair or trio 9
- 3(2). Spikelets subtended by 1 to many scaberulous bristles *Setaria*
- Spikelets not subtended by bristles 4
- 4(3). Ligule lacking; spikelets in irregular clusters along one side of the panicle branches; glumes and sterile lemma with short stiff hairs on the nerves *Echinochloa*
- Ligule present; plants not otherwise as above 5

- 5(4). Inflorescence an open to compact panicle, the primary branches regularly rebranched *Panicum*
- Inflorescence of chiefly simple, 1-sided, spikelike branches 6
- 6(5). Panicle of erect-appressed, spikelike branches mostly less than 5 cm long and racemously arranged along the main axis 7
- Panicle of mostly widely spreading, often elongate, spikelike branches mostly digitately arranged 8
- 7(6). Plants annual; second glume minutely awn-tipped; ligule a ring of hairs *Eriochloa*
- Plants perennial; second glume and lower lemma abruptly acute to rounded at the apex; ligule membranous *Panicum obtusum*
- 8(6). Plants annual; spikelets to ca 1 mm wide; panicle branches 2-16 *Digitaria*
- Plants perennial, stoloniferous; spikelets 1.2-2 mm wide; panicle branches 2 (4) *Paspalum*
- 9(2). Inflorescence typically 2.5-6 dm long; spikelets enveloped in long hairs arising chiefly from the base of the spikelet; culms mostly 2-4 m tall *Saccharum*
- Inflorescence less than 2 dm long (occasionally longer in two rare species); spikelets glabrous or hairy, in a few species partially obscured by long hairs arising from the rachis and pedicels; culms diverse in height 10
- 10(9). Inflorescence a compact to open panicle with primary branches rebranched 11
- Inflorescence of 1 to numerous, slender, subdigitately arranged racemes or racemelike branches terminating culms and (when present) culm branches .. 12
- 11(10). Spikelets all alike, each subtended by 1 or 2 short-hairy, nonspikelet-bearing pedicels *Sorghastrum*
- Spikelets dimorphic, the sessile broader than the pedicelled ones *Sorghum*
- 12(10). Culm and its branches terminating in a solitary raceme; pedicelled spikelets typically no wider than the pedicels, the latter ciliate with white hairs to ca 3 (4) mm long *Schizachyrium*
- Culm and (when present) its branches terminating in (1) 2 to numerous, loosely digitate racemelike branches; pedicelled spikelets diverse, in one species represented only by the pedicels; pedicels copiously pubescent with white or yellow hairs mostly 2-9 mm long 13
- 13(12). Pedicels and rachis segments (at least those toward the apex of the branches) vertically grooved, the central portion membranous; first glume of the sessile spikelet usually pubescent below midlength *Bothriochloa*
- Pedicels and rachis segments flat to rounded, not grooved down the center; first glume of the sessile spikelet glabrous or scaberulous below midlength *Andropogon*
- Inflorescence a 1-sided terminal spike or of (1) 2 to many, usually simple, spikelike branches, the latter in a few species spikeletlike and pendulous; spikelets arising from one side of a more or less flattened rachis 11
- 2(1). Glumes longer and broader than the solitary floret, strongly compressed and stiffly ciliate on the keel; spike dense, ovoid to cylindrical *Phleum*
- Glumes not both larger than a solitary floret and ciliate on the keel; spike diverse 3
- 3(2). First glume lacking (except in the terminal spikelet); spikelets strongly compressed, placed edgewise to and alternating on either side of the rachis *Lolium*
- First glume nearly always present, sometimes much reduced; spikelets not otherwise as above 4
- 4(3). Spikelets in clusters of 3 at each node of the rachis, the clusters hairy at the base (the hairs mostly 2-5 mm long) and falling from the rachis as a unit ... *Hilaria*
- Spikelets 1-7 at each node of the rachis, neither hairy at the base nor falling from the rachis as a unit 5
- 5(4). Spikelets 3 at each node of a readily disarticulating rachis, (continuous in the annual cultivar, *H. vulgare*), each 1-flowered, the central spikelet of the trio sessile, the lateral ones pedicelled (all sessile in *H. vulgare*) *Hordeum*
- Spikelets 1-7 per node of the continuous or disarticulating rachis, all sessile or nearly so and more than 1-flowered 6
- 6(5). Spikelets crowded on a continuous rachis, the internodes averaging less than 3 (0.2-3) mm long near midlength of the spike 7
- Spikelets diversely arranged on a continuous or disarticulating rachis, the internodes averaging at least 3 mm long near midlength of the spike 8
- 7(6). Plants annual; uppermost sheath typically inflated; internodes of the rachis 0.2-1 mm long .. *Eremopyrum*
- Plants perennial; uppermost sheath not inflated; internodes of the rachis mostly 1-3 mm long . *Agropyron*
- 8(6). Plants perennial, tufted or rhizomatous, occupying native or disturbed habitats *Elymus*
- Plants annual or biennial, solitary or in small tufts, occupying disturbed habitats 9
- 9(8). Spike cylindrical, to ca 5 mm wide; spikelets about as wide as the rachis and appressed to its concave aspect (sometimes slightly spreading at flowering) ... *Aegilops*
- Spike flattened or more or less 4-angled in cross section, nearly always more than 5 mm wide; spikelets broader than the rachis, erect to spreading 10
- 10(9). Glumes subulate to narrowly lanceolate, 1 (3) -nerved; lemmas coarsely ciliate on keel and exposed margins *Secale*
- Glumes broad, 3- to several-nerved; lemmas not coarsely ciliate *Triticum*
- 11(1). Inflorescence with spikelike branches in 1 or more whorls, in some species 1 to several branches loosely spaced below the terminal whorl 12
- Inflorescence either a solitary, 1-sided spike or a panicle with 1 to many, erect to pendulous spikelike branches racemously arranged along the rachis 15
- 12(11). Glumes or lemmas with awns at least 1 mm long 13
- Glumes and lemmas awnless 14

Key 2.

Spikelets sessile, 1- to many-flowered; lemmas usually laterally compressed; inflorescence either a solitary terminal spike or made up of 1 to many, usually simple, 1-sided, spikelike branches.

- 1. Inflorescence a solitary terminal spike; spikelets arising on alternate sides of or appearing to encircle the rachis 2

- 13(12). Panicle branches 3–20 in 1–5 whorls, each branch typically terminating in a floret; spikelets 2-flowered, the reduced lemma of the upper floret truncate and awned *Chloris*
- Panicle branches 2–6 in a single whorl, each branch terminating in a naked, sharp point 1–7 mm long; spikelets 3 (5) -flowered, the florets all well developed, the lemmas awn-tipped to short-awned; known in Utah from a single 1953 collection (Flowers 2317 UT), not persistent, not included in the text *Dactyloctenium aegyptium* (L.) Beauv.
- 14(12). Spikelets 1 (2) -flowered; both glumes 1-nerved; plants perennial, rhizomatous or stoloniferous *Cynodon*
- Spikelets 3- to 9-flowered; second glume 3- to 7-nerved; plants annual, usually branched from the base *Eleusine*
- 15(11). Spikelets obovate; glumes typically inflated to some degree, enclosing the floret except for the sharply pointed tip of the lemma *Beckmannia*
- Spikelets linear or lanceolate to elliptical; glumes not inflated, the florets often visible 16
- 16(15). Glumes (at least the conspicuous one) more than 1-nerved 17
- Glumes (both) 1-nerved 19
- 17(16). Plants perennial, strongly rhizomatous; spike-like branches 2–50 *Spartina*
- Plants annual; spike or spike-like branch solitary 18
- 18(17). Lemmas obtuse to truncate apically; spikelets disarticulating below the glumes *Sclerochloa*
- Lemmas acute to mucronate apically; spikelets disarticulating above the glumes *Eleusine*
- 19(16). Spike-like branches 0.5–2 cm long, readily disarticulating near the base and falling as a unit 20
- Spike-like branch or branches 0.5–15 cm long, persistent 21
- 20(19). Spike-like branches 1–5 per culm, erect to slightly spreading; florets staminate; plants stoloniferous, rare in Utah *Buchloe*
- Spike-like branches 2–80 per culm, mostly ascending to widely spreading or pendulous; lowermost florets perfect; plants rarely stoloniferous, general in distribution *Bouteloua*
- 21(19). Spikelets disarticulating below the glumes; glumes nearly always short-ciliate on the prominent keel; plants coarse, strongly rhizomatous, occupying wet places *Spartina*
- Spikelets disarticulating above the glumes; glumes diverse, not short-ciliate on the keel; plants mostly slender-stemmed, often annual, occupying diverse habitats 22
- 22(21). Spikelets 1-flowered, about as broad as and mostly appressed to the concave surface of the branches; branches linear, 2–20 cm long and stiffly spreading from the main axis *Schedonnardus*
- Spikelets more than 1-flowered (upper florets often reduced or rudimentary), either broader than or not strictly appressed to the branches; branches nonlinear, 0.5–16 cm long 23
- 23(22). Spikelets with 2–12 well-developed florets . *Leptochloa*
- Spikelets with 1 perfect floret below 1 or 2 (4) rudimentary ones 24
- 24(23). Upper florets consisting entirely or in part of 1–3 awns; lemma of the perfect floret awned or unawned; spike-like branches 0.5–5 cm long, usually about equally spaced along the main axis, occasionally solitary *Bouteloua*

- Upper floret more or less club-shaped with a short solitary awn; lemma of the perfect floret with an awn 4–12 mm long; spike-like branches 2–16 cm long, usually at least some of them in closely spaced groups *Chloris*

Key 3.

Spikelets pedicelled, each with a single perfect or pistillate floret, several species having 1 or 2 (3) staminate or neuter to rudimentary florets above or below the fertile one, the lemmas then dissimilar.

- 1. Glumes lacking; spikelets strongly flattened, mostly short-pedicelled and appressed to one side of the panicle branches; lemmas minutely ciliate on the keel; plants tall, occupying wet areas *Leersia*
- Glumes (at least one) present or, if obsolete, the plants not otherwise as above 2
- 2(1). Reduced florets regularly present in each spikelet (in one species absent in the lowermost spikelet of each panicle branch) 3
- Reduced florets not regularly present in each spikelet (or not recognizable as such) 13
- 3(2). Spikelets with 1–3 rudimentary florets above the perfect one 4
- Spikelets with all reduced florets below (or appearing lateral to) the perfect one, in some species the spikelets appearing to have 3 glumes 9
- 4(3). Inflorescence of 1 to many, simple, spike-like, 1-sided branches 5
- Inflorescence a spike-like to loose panicle, the latter with branches mostly rebranched and not 1-sided ... 6
- 5(4). Branches of the inflorescence 2–16 cm long, arranged in whorls, occasionally some of the branches solitary or racemously arranged below the terminal whorl ... *Chloris*
- Branches of the inflorescence 0.5–5 cm long, racemously arranged, occasionally solitary ... *Bouteloua*
- 6(4). Lowermost lemma terminating in 9 plumose awns . *Enneapogon*
- Lowermost lemma awnless or no more than 3-awned 7
- 7(6). Lemmas leathery and glossy, the lowermost typically awnless, the upper with a straight to hooked awn to 2 mm long *Holcus*
- Lemmas thin or dull, the lowermost awned, the upper diverse 8
- 8(7). Lowermost lemma with a stout, geniculate awn 10–15 mm long arising from the back ... *Helictotrichon*
- Lowermost lemma with the midnerve free as a plumose awn 3–5 mm long *Blepharidachne*
- 9(3). Lower lemma with an awn 1–2 cm long *Arrhenatherum*
- Lemmas awnless 10
- 10(9). Sterile lemma resembling the second glume in size and texture *Panicum*
- Sterile lemma not resembling the second glume 11
- 11(10). Panicle open, the branches naked at the base; spikelets bronze in color; lower (lateral) florets broader than the fertile one *Hierochloa*
- Panicle compact or, if open, the branches spikelet-bearing to the base or nearly so; spikelets whitish, green, or tawny; rudimentary florets much narrower than the fertile one 12
- 12(11). Glumes with hairs mostly 8–15 mm long *Imperata*
- Glumes glabrous to short-hairy *Phalaris*

- 13(2). Glumes (at least one) averaging shorter than the lemma; glumes and lemmas all 1-nerved, neither awned nor awn-tipped 14
 — Plants not as above in every detail 17
- 14(13). Ligule membranous *Muhlenbergia*
 — Ligule a ring of hairs 15
- 15(14). Lemmas bearded on the callus with hairs at least half as long as the lemma *Calamovilfa*
 — Lemmas glabrous or at most scaberulous 16
- 16(15). Panicle spike-like, 0.3–8 cm long; plants annual and often mat-forming *Crypsis*
 — Panicle open or, if spike-like, more than 8 cm long; plants perennial or rarely annual but not mat-forming *Sporobolus*
- 17(13). Spikelets disarticulating below (and sometimes also above) the glumes, in a few species disarticulation occurring in the rachis, the pedicels, or at the base of short panicle branches 18
 — Spikelets disarticulating above the glumes, not regularly breaking off below the glumes or in the rachis, pedicels, or panicle branches 32
- 18(17). Rachis of the inflorescence readily disarticulating; spikelets short-pedicelled in groups of 3 at each node; glumes awn-like throughout their length or nearly so *Hordeum*
 — Rachis of the inflorescence remaining intact; plants not otherwise as above 19
- 19(18). Spikelets enveloped by hairs 4–12 mm long arising chiefly from the base of the spikelet; panicles 10–60 cm long 20
 — Spikelets not enveloped by long hairs, or the hairs not arising chiefly from the base of the spikelet; panicles diverse 21
- 20(19). Lemmas awned *Saccharum*
 — Lemmas awnless *Imperata*
- 21(19). Ligule a ring of hairs 22
 — Ligule membranous 23
- 22(21). Plants annual, often mat-forming with decumbent to prostrate culms; sheaths glabrous or minutely ciliate below the summit; panicles spike-like, 0.3–6.5 (8) cm long *Crypsis*
 — Plants perennial or, if annual, not otherwise as above *Sporobolus*
- 23(21). First glume typically 2-nerved, bifid or awned at the apex; branches of the panicle disarticulating at the base 24
 — First glume not both 2-nerved and either bifid or awned at the apex; branches of the panicle not regularly disarticulating 25
- 24(23). Plants annual; first glume unawned, typically bifid apically; spikelets 1–3 per branch, the pedicels distinctly unequal in length *Muhlenbergia depauperata*
 — Plants perennial; first glume with 2 awns typically 1–5 mm long; spikelets borne on paired, subequal pedicels *Lycurus*
- 25(23). Glumes averaging shorter than the body of the lemma, conspicuously soft-hairy on the keel *Alopecurus*
 — Glumes (at least the second) equal to or longer than the body of the lemma, glabrous or hairy on the keel 26
- 26(25). First glume lacking, the second one firm and completely enclosing the thin lemma; plant a low, strongly rhizomatous and often stoloniferous lawn-grass or weed, rare in Utah *Zoysia*
 — First glume present; plant either tall or without rhizomes 27
- 27(26). Glumes with awns averaging more than 1 (1–10) mm long; inflorescence a dense to somewhat interrupted, mostly spike-like panicle 28
 — Glumes awnless or with an awn tip to ca 1 mm long; inflorescence diverse 29
- 28(27). Awn of the glumes noncapillary, to 4 mm long; glumes strongly compressed, the prominent keel ciliate with spreading hairs mostly at least 0.5 mm long *Phleum*
 — Awn of the glumes hair-like or nearly so, 1–10 mm long; glumes not strongly compressed or, if so, the keel only minutely hairy *Polygonum*
- 29(27). Panicle nodding, 1–3 dm long; glumes narrowly lanceolate, scabrous to short-ciliate on the sharp keel *Cinna*
 — Panicle erect or plants not otherwise as above 30
- 30(29). Inflorescence of multiple, 1-sided, spike-like branches; glumes glabrous *Beckmannia*
 — Inflorescence a terminal, spike-like to more or less interrupted panicle; glumes scabrid-roughened to variously hairy 31
- 31(30). Spikelets strongly compressed, the glumes hairy on the keel or throughout *Alopecurus*
 — Spikelets subterete, the glumes roughened to scabrid-puberulent over the back (at 10x magnification) *Polygonum semiverticillatus*
- 32(17). Lemma with a terminal or dorsal awn averaging at least 1 mm long (in some species the awn joined to the lemma and readily deciduous, the lemmas then terete or nearly so and firmer than the glumes) 33
 — Lemmas awnless or with an awn tip averaging less than 1 mm long 45
- 33(32). Awn of the lemma 3-branched *Aristida*
 — Awn of the lemma simple 34
- 34(33). Awn arising from the back of the lemma 35
 — Awn terminal on the lemma 40
- 35(34). Callus bearded, the longer hairs at least 1/3 as long as the lemma *Calamagrostis*
 — Callus glabrous or bearded with hairs less than 1/3 as long as the lemma 36
- 36(35). Lemmas 3 mm long or longer 37
 — Lemmas less than 3 mm long 38
- 37(36). Awn of the lemma arising below midlength *Calamagrostis*
 — Awn of the lemma arising above midlength (spikelets normally 2-flowered, plant will rarely key here) *Trisetum*
- 38(36). Rachilla of the spikelet prolonged behind the palea and conspicuously hairy *Calamagrostis rubescens*
 — Rachilla sometimes minutely prolonged but not long-hairy 39
- 39(38). Lemma thinner than the glumes, glabrous, the awn rarely as much as 5 mm long *Agrostis*
 — Lemmas slightly firmer than the glumes, regularly scaberulous above midlength, the awn (4) 6–16 mm long *Apera*
- 40(34). Awns deciduous 41

- Awns persistent 42
- 41(40). Body of the lemma with hairs 1–4 mm long, the callus 0.5–1 mm long and obtuse to sharply acute *Stipa*
- Body of the lemma glabrous or with hairs less than 1 mm long, the callus less than 0.5 mm long and blunt *Oryzopsis*
- 42(40). Awn jointed to the lemma, the junction between awn and lemma clearly visible unless obscured by hairs arising near the apex of the lemma *Stipa*
- Awn confluent with the lemma, no joint visible; lemma glabrous to scabrous or, if hairy, the hairs not prolonged beyond the apex 43
- 43(42). Pedicels distinctly short-hairy (at 5x magnification), mostly about equal to or slightly longer than the body of the lemma; second glume 4.5–7 mm long *Festuca dasyclada*
- Pedicels glabrous to scabrid-puberulent (at 10x magnification), averaging shorter or much longer than the body of the lemma; glumes rarely to 4.5 mm long ... 44
- 44(43). Second glume slightly exceeding the floret; lemma with a hairlike, flexuous awn 4–16 mm long *Apera*
- Second glume shorter than the floret or, if longer, the lemma long-hairy, awn-tipped, or with a stout rigid awn *Muhlenbergia*
- 45(32). Lemmas laterally compressed, firm and glossy, subtended laterally by minute, closely appressed, bristlelike structures that often appear to be pubescence on the lemma *Phalaris*
- Lemmas not as above in every particular 46
- 46(45). Lemmas yellow brown, more or less fleshy, conspicuously 3–nerved, apically truncate and erose... *Catabrosa*
- Lemmas not as above 47
- 47(46). Ligule of hairs 48
- Ligule a membrane 50
- 48(47). Lemmas bearing a basal tuft of hairs to 2 mm long .. *Redfieldia*
- Lemmas glabrous to minutely hairy 49
- 49(48). Lemmas awn-tipped to short-awned *Muhlenbergia*
- Lemmas obtuse to acute, neither awn-tipped nor awned *Sporobolus*
- 50(47). Lemmas 3–nerved, each nerve hairy over at least the lower 1/3, otherwise glabrous; glumes smooth throughout *Blepharoneuron*
- Lemma diversely nerved, glabrous or the hairs not restricted to the nerves; glumes often scabrous, at least on the midnerve 51
- 51(50). Callus bearded with hairs 1/4 the length of the lemma or longer *Calamagrostis*
- Callus glabrous or minutely hairy 52
- 52(51). Lemmas less than 3 mm long (including awn tip when present) 53
- Lemmas 3 mm long or more (including awn tip when present) 55
- 53(52). Glumes (at least one) averaging shorter than the lemma, rarely both longer and then the lemma conspicuously hairy; spikelets greenish white to dark gray *Muhlenbergia*
- Glumes both longer than the lemma (sometimes barely so); lemma glabrous or minutely hairy on the callus; spikelets green or purple-tinged to dark purple 54
- 54(53). Glumes stiffly ciliate on the prominent keel, abruptly tapered at the apex into a stout awn 0.6–4 mm long *Phleum*

- Glumes glabrous or scabrous, awnless or at most minutely awn-tipped *Agrostis*
- 55(52). Lemmas green and often purple-tinged; rachilla prolonged behind the palea and pubescent with hairs at least 0.5 mm long *Trisetum wolfii*
- Lemmas whitish or more often gray green to black (in one species red purple to brownish); rachilla either not prolonged or not long-hairy *Muhlenbergia*

Key 4.

Spikelets pedicelled, 2– to many-flowered, disarticulating above or below the glumes; florets perfect or occasionally unisexual; lemmas variously compressed, all similar as to shape and texture (except in *Hierochloa*); at least the longer glume equal to or exceeding the body of the lowermost lemma.

- 1. Lemmas awnless or with an awn tip not more than 1 mm long 2
- Lemmas (at least 1 per spikelet) awned, the awns terminal or dorsal, averaging more than 1 mm long . 15
- 2(1). Ligule a ring of hairs, sometimes with a short membranous base; lemmas pubescent 3
- Ligule membranous; lemmas glabrous or pubescent . 5
- 3(2). Lemmas more than 3–nerved; plants annual . *Schismus*
- Lemmas 3–nerved; plants perennial 4
- 4(3). Panicle to 4.5 cm long, about as broad as long; leaf blades rarely as much as 6 cm long; lemmas awn-tipped *Erioneuron*
- Panicle 4.5–20 cm long, longer than broad; leaf blades mostly 3–25 cm long; lemmas usually shallowly notched, not awn-tipped *Tridens*
- 5(2). Glumes 1.6–3 cm long; plants annual, cultivated or escaped. *Avena fatua* var. *sativa*
- Glumes no more than 1.4 cm long, plants either perennial or native 6
- 6(5). Lemmas typically more than 5–nerved, the nerves prominent; culms either bulbous-based or the spikelets 6–24 mm long and falling entire. *Melica*
- Lemmas no more than 5–nerved or the nerves faint (lemmas obscured by the long hairs in *Arundo*); culms not bulbous-based; spikelets either disarticulating above the glumes or less than 6 mm long 7
- 7(5). Spikelets ovate; glumes soon turning bronze-membranous throughout; florets subsessile, the narrow central floret often obscured by the broad lateral ones *Hierochloa*
- Spikelets lanceolate to elliptical or the glumes not both bronze in color and membranous, the florets not dimorphic as above 8
- 8(7). Glumes markedly dissimilar, the first linear, the second oblanceolate to obovate, 3–4 times as wide as the first; spikelets disarticulating below the glumes ... *Sphenopholis*
- Glumes similar in shape or not dissimilar as above; spikelets disarticulating above the glumes 9
- 9(8). Lemmas pubescent with hairs 6–9 mm long ... *Arundo*
- Lemmas glabrous or pubescent with hairs less than 6 mm long 10
- 10(9). Rachilla pubescent with hairs to ca 1 mm long; glumes equal or nearly so, averaging more than 5 (4.5–8.5) mm long *Trisetum wolfii*
- Rachilla glabrous to minutely hairy; glumes often unequal, at least one less than 5 mm long 11

- 11(10). Spikelets to 2.8 mm long, whitish to pale or dark gray (spikelets typically 1-flowered, plant will rarely key here) *Muhlenbergia asperifolia*
- Spikelets either at least 3 mm long or not whitish to dark gray 12
- 12(11). Panicle spike-like or nearly so, the rachis and pedicels of the panicle minutely soft-hairy throughout (at 10x magnification); paleas shiny-hyaline throughout, prominent at flowering *Koeleria*
- Panicle open or rarely spike-like, the rachis and pedicels glabrous to scabrid-puberulent; paleas not hyaline throughout, at least the nerves green 13
- 13(12). Lemmas minutely awn-tipped *Festuca*
- Lemmas abruptly to sharply acute but not awn-tipped 14
- 14(13). Panicle of simple, spike-like, 1-sided branches; second glume 1-nerved; plants reported only from Washington County *Leptochloa filiformis*
- Panicle of regularly rebranched branches; second glume 3- to 5-nerved; plants general in distribution *Poa*
- 15(1). Awn arising from the tip of the lemma or produced in the sinus of a mostly bilobed apex 16
- Awn arising from the back of the lemma, below the entire to toothed or lobed apex 22
- 16(15). Lemmas terminating in 9 plumose awns ... *Enneapogon*
- Lemmas with fewer awns 17
- 17(16). Lemmas pubescent with hairs 6-9 mm long; panicle 20-70 cm long *Arundo*
- Lemmas glabrous or pubescent with hairs less than 6 mm long; panicles often less than 20 cm long 18
- 18(17). Lemmas prominently 3-nerved; ligule a ring of hairs 19
- Lemmas either more than 3-nerved or the nerves obscure; ligule diverse 20
- 19(18). Spikelets 4-flowered; uppermost lemma reduced to a 3-awned rudiment, the lower lemmas lobed to midlength or below, the midnerve free as a plumose awn *Blepharidachne*
- Spikelets mostly (4) 5- to 18-flowered; uppermost lemma smaller than those below but not rudimentary, the lower lemmas entire or lobed for less than half their length, the awn not plumose *Erioneuron*
- 20(18). Awn (at least the central one) flattened near the base; spikelets 9-24 mm long; ligule a ring of hairs *Danthonia*
- Awn terete or nearly so; spikelets often less than 9 mm long; ligule membranous 21
- 21(20). Awns averaging more than 5 (4-10) mm long; panicle branches glabrous or scabrous to puberulent ... *Bromus*
- Awn 1-5 mm long; panicle branches typically short-hairy *Festuca dasyclada*
- 22(15). Glumes 1.6-3 cm long; plants coarse annuals of the valleys *Avena*
- Glumes less than 1.6 cm long; plants diverse 23
- 23(22). Florets dissimilar, at least as to the awns 24
- Florets similar 26
- 24(23). Lower floret typically awnless; upper floret with a hooked or occasionally straight awn to ca 2 mm long *Holcus*
- Lower floret with a geniculate awn; upper floret awnless or with a straight, twisted, or geniculate awn usually more than 2 mm long 25
- 25(24). Plants to 2 dm tall, rare, restricted to high elevations *Helictotrichon*
- Plants (6) 7-18 dm tall, occupying disturbed sites from low to moderately high elevations *Arrhenatherum*
- 26(23). Lemmas at maturity smooth and shiny, typically blunt and minutely toothed to erose apically, the awn arising near midlength or below *Deschampsia*
- Lemmas dull, often scaberulous, acute and often minutely bristle-toothed apically, the awn diverse .. 27
- 27(26). Callus bearded with hairs more than 1 mm long or the awn arising below midlength of the lemma (florets typically 1-flowered, plant will rarely key here) ... *Calamagrostis*
- Callus glabrous or bearded with hairs no more than 1 mm long, the awn arising above midlength of the lemma *Trisetum*

Key 5.

Spikelets pedicelled, 2- to many-flowered, disarticulating above or rarely below the glumes; florets perfect or occasionally unisexual, rarely replaced by bulblets; both glumes averaging shorter than the body of the lowermost lemma.

1. Plants mostly 2-4 m tall, occurring in low wet places; panicles 1.5-5 dm long; spikelet rachilla with spreading hairs exceeding the narrowly lanceolate lemmas *Phragmites*
- Plants either less than 2 m tall or not otherwise as above 2
- 2(1). Spikelets in dense, 1-sided clusters at the tips of otherwise naked branches; glumes awn-tipped, the keel coarsely ciliate to occasionally merely scabrous; sheaths closed at least half their length, often compressed and keeled *Dactylis*
- Plants not as above in every particular 3
- 3(2). Lemmas (1 or more per spikelet) with an awn more than 0.5 mm long 4
- Lemmas awnless or with an awn tip no more than 0.5 mm long 11
- 4(3). Spikelets 2-flowered; lemma of the lower floret with a dorsifixed, geniculate awn mostly 1-2 cm long; lemma of upper floret awnless or with a terminal awn shorter and more slender than that of the lower floret *Arrhenatherum*
- Spikelets more than 2-flowered or the awns of the lemmas not as above 5
- 5(4). Lemmas prominently 3-nerved, the lateral nerves and usually the midnerve hairy (often near the base), otherwise glabrous, the awn 0.5-3.5 mm long ... 6
- Lemmas either more than 3-nerved or not with pubescence restricted to the nerves, the awn variable in length 7
- 6(5). Panicle 7-40 cm long, plants of mostly wet places ... *Leptochloa*
- Panicle to 4.5 cm long; plants of dry places . *Erioneuron*
- 7(5). Sheaths of culm leaves closed at least half their length, sometimes mechanically split and then the margins not overlapping; lemmas 6-17 mm long ... 8
- Sheaths of the culm leaves open throughout or nearly so, the margins typically overlapping; lemmas in some species less than 6 mm long 9
- 8(7). Callus of the lowermost lemma bearded with hairs 1-3 mm long *Schizachne*
- Callus glabrous or minutely hairy *Bromus*

- 9(7). Awn of the lemma arising 0.5–2.5 mm below the entire to bristle-toothed apex; rachilla of the spikelet pubescent with hairs mostly 0.5–1 mm long . . . *Trisetum*
- Awn of the lemma terminal or arising less than 0.5 mm below the acute apex; rachilla of the spikelet glabrous or the hairs minute 10
- 10(9). Inflorescence a usually glistening, spikelike panicle; spikelets 2 (3–5) -flowered; glumes and lemmas strongly keeled, broadly membranous-margined, the awns to ca 1 mm long *Koeleria*
- Inflorescence not spikelike; spikelets 2– to 20-flowered; glumes and lemmas mostly rounded on the back, not broadly membranous-margined, the awns often more than 1 mm long *Festuca*
- 11(3). Pedicels hairlike, mostly 1–5 cm long, much longer than the 4–8 mm long spikelets; rhizomatous perennial of sand dunes *Redfieldia*
- Pedicels not both long and hairlike or the spikelets less than 4 mm long; plants of diverse habitats 12
- 12(11). Lemmas prominently 3-nerved, the lateral nerves sometimes very near the margins 13
- Lemmas either more than 3-nerved or the nerves not regularly conspicuous 18
- 13(12). Lemmas averaging more than 6 (6–14) mm long, glabrous or, if puberulent, the hairs not confined to the nerves 14
- Lemmas averaging less than 6 (2–6) mm long or rarely to 6 mm, the 3 nerves then conspicuously hairy 15
- 14(13). Spikelets to 11 mm long; panicles usually nodding *Festuca sororia*
- Spikelets 12–40 mm long; panicles usually erect *Bromus*
- 15(13). Lemmas firm to somewhat fleshy, typically yellow brown, erose to irregularly toothed at the truncate apex; plants rhizomatous perennials of wet places *Catabrosa*
- Lemmas not as above; plants either annual or without rhizomes, occupying diverse habitats 16
- 16(15). Ligules membranous; sheaths glabrous or rarely long-hairy throughout *Leptochloa*
- Ligules of short hairs, sheaths often ciliate with longer hairs lateral to the ligule 17
- 17(16). Glumes 1–3 mm long; lemmas with nerves glabrous or scaberulous *Eragrostis*
- Glumes (the longer one) 4–6 mm long; lemmas with nerves hairy *Tridens*
- 18(12). Glumes dissimilar, the first linear, the second oblanceolate to obovate and 3–4 times as broad as the first; lemmas obscurely nerved, glabrous or scaberulous *Sphenopholis*
- Glumes similar in shape or not dissimilar as above; lemmas diverse 19
- 19(18). Lemmas no more than 3 (1–3) mm long 20
- Lemmas averaging more than 3 (3–17) mm long 24
- 20(19). Lemmas 1.2–2 mm long, 3-nerved, whitish to dark gray green, occasionally purple-tinged; plant a rhizomatous perennial occurring below 2135 m (spikelets normally 1-flowered, plant will rarely key here) *Muhlenbergia asperifolia*
- Lemmas to 3 mm long, often more than 3-nerved; plants otherwise diverse 21
- 21(20). First glume more than 2 mm long or, if shorter, the lemmas compressed and keeled, glabrous to conspicuously hairy, 3– to 5-nerved, sometimes obscurely so *Poa*
- First glume averaging less than 2 (0.4–2.2) mm long, lemmas rounded on the back, glabrous or inconspicuously hairy near the base, 5– to 7-nerved, obscurely or prominently so 22
- 22(21). Lemmas obscurely nerved *Puccinellia*
- Lemmas prominently (5) 7– to 9-nerved 23
- 23(22). Sheaths closed to the top or nearly so; second glume 1-nerved; lemmas mostly obtuse to rounded apically *Glyceria*
- Sheaths open throughout, the membranous borders overlapping; second glume 3-nerved; lemmas mostly truncate apically *Puccinellia pauciflora*
- 24(19). Inflorescence a spikelike panicle (the short branches often spreading at flowering), the rachis and pedicels minutely soft-hairy (at 10x magnification); palea shiny-hyaline throughout, usually prominent at flowering *Koeleria*
- Inflorescence diverse but, if spikelike, the rachis glabrous or scabrous, not minutely soft-hairy; plants not otherwise as above in every particular 25
- 25(24). Rachilla pubescent with hairs to ca 1 mm long; lower lemma 4–6 mm long, keeled; anthers 0.6–1.3 mm long *Trisetum wolfii*
- Rachilla glabrous to minutely hairy; plants otherwise diverse 26
- 26(25). Sheaths of the culm leaves closed about half their length or more, occasionally mechanically split, the margins then not overlapping 27
- Sheaths of culm leaves regularly open more than half the length to throughout, the margins typically overlapping 31
- 27(26). Lemmas mostly 7– to 15-nerved 28
- Lemmas with fewer than 7 nerves or the nerves obscure 30
- 28(27). Lemmas to ca 4 mm long; plants of wet places *Glyceria borealis*
- Lemmas 6–18 mm long; plants of mostly mesic to dry sites 29
- 29(28). Culms bulbous at the base or the spikelets borne on pubescent pedicels and disarticulating below the glumes *Melica*
- Culms fibrous-rooted; spikelets not borne on hairy pedicels or, if so, disarticulating above the glumes *Bromus*
- 30(27). Spikelets at maturity averaging more than 12 (10–50) mm long; lemmas at least 6 mm long; ovary or fruit bearing an apical tuft of short hairs *Bromus*
- Spikelets at maturity averaging no more than 12 (2–12) mm long; lemmas often less than 6 mm long; ovary or fruit lacking an apical tuft of hairs *Poa*
- 31(26). Panicle 1-sided, spikelike (occasionally branched near the base), to 4 (5) cm long and 12 mm wide; spikelets disarticulating below the glumes and falling entire; plant a low, glabrous, weedy annual *Sclerochloa*
- Panicle either not spikelike or not second, often more than 5 cm long and 12 mm wide; spikelets disarticulating above the glumes; plants otherwise diverse 32

- 32(31). Lemmas 7- to 13-nerved, the nerves visible at 10x magnification on all but the most mature florets; florets unisexual; leaf blades at culm base typically scale-like; plants strongly rhizomatous, growing in alkaline-saline soils (occasionally weedy in neutral soils of the valleys) *Distichlis*
- Lemmas not more than 5-nerved, or the plants not otherwise as above in every particular 33
- 33(32). Lemmas distinctly roughened to scabrous throughout (at 10x magnification), firmer than the largely or entirely membranous glumes, (4.5) 5-10 mm long; florets typically unisexual, often subterete; panicle branches and pedicels smooth or nearly so ... *Leucopoa*
- Lemmas not both scabrous throughout and conspicuously firmer than the glumes, variable in length; florets diverse; panicle branches smooth or scabrous to hairy 34
- 34(33). Lemmas acute to awn-tipped, sometimes minutely so, rounded on the back or, if somewhat keeled, the lemmas often averaging more than 6 (6-10) mm long; sheaths in some species with well-developed auricles *Festuca*
- Lemmas rounded to acute but not awn-tipped at the apex, compressed and keeled, or if rounded on the back, rarely averaging more than 6 (2-7) mm long; sheaths lacking auricles (in *P. bulbosa* the florets replaced by bulblets) *Poa*

Aegilops L.

Annuals; sheaths open, with or without auricles; blades usually flat; ligule membranous, short; inflorescence a spike, the rachis disarticulating either at the nodes or near the base and then the spike falling entire; spikelets 2- to 8-flowered, solitary and sessile at each node, terete, and fitting closely into a shallow concavity in the rachis, the lowermost 1 or 2 spikelets vestigial; glumes oblong to obovate, leathery to hardened, subequal, more than half as long as the opposing lemma, flat to rounded on the back, many nerved, awned or awnless; lemma oblong to lance-oblong, usually rounded on the back, 5- to 13-nerved, awned or awnless; callus very short, obtuse; palea subequal to the lemma; stamens 3; caryopsis free of or adherent to the lemma and palea; embryo to about half as long as the grain; $x = 7$.

Aegilops cylindrica Host Jointed Goatgrass. [*Triticum cylindricum* (Host) Cesati]. Annual; culms mostly 2-6 dm tall, erect or geniculate at the lower nodes; lower sheaths sparsely hairy, the upper glabrous with auricles small or lacking; blades flat to somewhat involute, 2-5 mm wide, often sparsely hairy; ligule to ca 0.5 mm long; spike cylindrical, 4-12 cm long, 3-5 mm wide, disarticulating at the base and ultimately between the florets; spikelets 2- to 5-flowered, sessile and solitary at each node of the rachis, subequal to the internodes, terete and strongly appressed to the more or less concave joint of the rachis or occasionally slightly spreading at flowering; glumes hardened, 6-10 (14) mm long, mostly 6- to 9-nerved, the apex laterally toothed or awned; awns of the terminal spikelet mostly 3-8 cm long, those of the lower spikelets 0.1-2 cm long; lemma membranous below, hardened above, rounded on the back, 5- to 7-nerved, those of upper spikelets with awns mostly 3-7 cm long, those of lower spikelets with awns to ca 2 cm long; $2n = 28$. Disturbed sites, especially along roadsides and in fallow

fields at 1070 to 2130 m in Box Elder, Cache, Davis, Duchesne, Garfield, Iron, Juab, Kane, Millard, Salt Lake, San Juan, Sanpete, Tooele, Uintah, Utah, Wasatch, Washington, and Weber counties; native to Eurasia, introduced to the U. S. about 1930 and now widely established; 51 (vi). According to Tsvelev (1984), jointed goatgrass is a good source of forage.

Agropyron Gaertner

Perennials; culms solitary or tufted; sheaths with or without auricles, those of the cauline leaves open for more than 2/3 their length, those of the basal leaves closed throughout or nearly so; blades flat to involute; ligule membranous; inflorescence a spike, the rachis continuous, the internodes much shorter than the spikelets; spikelets 3- to 10-flowered, sessile and solitary at each node of the rachis, strongly overlapping to widely spreading, compressed, disarticulating above the glumes and between the florets; glumes lanceolate to lance-ovate, somewhat asymmetrical, unequal, 1- to 4-nerved, often obscurely so, typically keeled, acute or short-awned; lemma lanceolate to lance-oblong, 5-nerved, laterally compressed and usually keeled, with or without a short awn; callus to 0.2 mm long, rounded, glabrous or minutely bearded; palea equal or subequal to the lemma, keeled on each of the 2 nerves, 2-toothed at the apex; stamens 3; caryopsis ellipsoidal, typically somewhat adherent to the palea and often to the lemma, the embryo 1/6-1/2 as long as the grain; $x = 7$. The tribe Triticeae, of which *Agropyron* is a member, consists of a series of closely allied, interbreeding taxa about whose generic alignments considerable disagreement exists. Barkworth et al. (1983) and Dewey (1984), on the basis of genome homology as revealed by the level of chromosome pairing in artificially produced hybrids, would redistribute among seven genera (*Elytrigia*, *Leymus*, *Pascopyrum*, *Pseudoroegneria*, *Psathyrostachys*, *Thinopyrum*, and a redefined *Elymus*) those species traditionally included in *Agropyron*, *Elymus*, and *Sitanion*. In applying the genomic method of classification to the Triticeae of North America, however, Barkworth and Dewey (1985) find it necessary to describe plants belonging to the genus *Leymus* as having one set of characters when growing inland and a diametrically opposite set when growing along the coast. Thus, a classification based on genomic data violates the concept that a genus is composed of taxa universally recognizable by a unique cluster of characters. I have followed the treatment of Gould (1947) and the persuasive logic of Estes and Tylr (1982) in adding *Sitanion* and all of *Agropyron* except the crested wheatgrasses to the genus *Elymus*. A guide to some of the more common hybrids produced by the often freely interbreeding members of the tribe Triticeae is provided following the key to the genus *Elymus*.

Agropyron cristatum (L.) Gaertner Fairway or Crested Wheatgrass. [*Bromus cristatus* L.; *A. desertorum* (Link) Schultes; *A. fragile* (Roth) Candargy; *A. pectiniforme* R. & S.; *A. sibiricum* (Willd.) Beauv.]. Perennial; culms tufted, (1) 2–10 dm tall, erect or geniculate at the lower nodes, sheaths glabrous or the lower ones sparsely hairy, often with well-developed auricles; blades flat or loosely involute upon drying, 2–5 (7) mm wide, entirely glabrous or scaberulous to short-hairy; ligule to ca 1 mm long; spike narrowly oblong to lanceolate or oval, (1.5) 2–10 (15) cm long, 5–23 mm wide, the rachis typically puberulent, the internodes mostly 1–3 mm long; spikelets 3- to 10-flowered, 5–15 mm long (excluding awns), strongly ascending and closely overlapping to widely divergent; glumes thin to somewhat thickened, subequal or unequal, ovate to lance-elliptical, (2) 3–6 (7) mm long, asymmetrical, the midnerve often prolonged to a short awn, glabrous or the keel scabrous to sparsely ciliate; lemma 4–8.5 mm long, glabrous or occasionally short-hairy, acute to more often awn-tipped or awned, the awn to 3 (4) mm long; palea scabrous on the keels; anthers 2.5–4 mm long; 2n = 14, 28, 42. Usually in disturbed or revegetated sites along roadways, on open hillsides, and in salt desert shrub, sagebrush, pinyon-juniper, mountain brush, and ponderosa pine communities at 910 to 2740 m in all Utah counties except Summit; native to Eurasia, introduced to North America from Siberia in 1898, now widely distributed in western Canada, much of the western U. S., and the Great Plains; 135 (v). Various treatments have been proposed whereby at least three species may be supposedly recognized in contemporary material, but of the three only two are widely planted. The following key may be helpful in separating these two cultivars, especially in the field:

- 1. Spikelets ultimately divergent from the rachis at a wide angle; culms often less than 4 dm tall, typically variable in height and erect or more often geniculate at the lower nodes; leaves both basal and cauline *A. cristatum* (fairway wheatgrass)
- Spikelets at maturity strongly ascending; culms often more than 4 dm tall, typically about equal in height and strictly erect; leaves chiefly basal; plants adapted to slightly dryer sites than *A. cristatum* *A. desertorum* (standard wheatgrass)

Agropyron cristatum (sensu amplo), is known to hybridize in nature with *Elymus repens* and *E. trachycaulus* (see guide to hybrids p. 722). All strains of crested wheatgrass, being long-lived and resistant to both cold and drought, are useful in arid areas of the Intermountain Region for hay, pasture, range seeding, and erosion control. Standard wheatgrass can be grown where the mean annual precipitation is as low as 23 cm, whereas fairway requires a minimum of 30 cm. Both strains are easily

established and in favorable years make good fall regrowth (Thornburg 1982). The species is moderately alkali-tolerant and does well on all but hard clay and coarse, sandy soils. Crested wheatgrass provides good spring forage but is not as desirable on summer range as other introduced wheatgrasses (Vallentine 1961).

Agrostis L.

Annuals or perennials; sheaths glabrous, open to the base or nearly so; ligule membranous; inflorescence a spike-like to open panicle; spikelets laterally compressed to terete, 1-flowered or rarely a few spikelets within a panicle 2 (3) -flowered, the rachilla disarticulating above the glumes and occasionally prolonged behind the palea as a short stub or bristle; glumes equal or unequal, lanceolate to ovate, obtuse to awn-tipped, the first exceeding the second, 1-nerved, the second 1 (3) -nerved, typically equal to or longer than the lemma; lemma thinner than or occasionally similar to the glumes in texture, whitish to dark purple, somewhat compressed laterally, glabrous or the upper portion scabrous, obscurely 3- to 5-nerved, acute to truncate and often minutely erose apically, occasionally with a straight to bent awn arising from the back; callus glabrous or laterally bearded with minute tufts of hair; palea hyaline, shiny, well developed to rudimentary or lacking; stamens 3; caryopsis free within the lemma and palea, broadly ellipsoidal, the embryo less than half as long as the grain; x = 7. Difficulties in identifying taxa in *Agrostis* may be due in part to the frequency of interspecific hybridization, ample evidence for which exists in our populations.

- 1. Palea lacking or less than half as long as the lemma 2
- Palea at least half as long as the lemma 5
- 2(1). Panicles narrow and green or occasionally purple-tinged, the branches scabrous and mostly spikelet-bearing to the base or nearly so; glumes long-tapered and distinctly longer than the lemma; plants (1) 2–15 dm tall; leaf blades flat, 1.5–11 mm wide *A. exarata*
- Panicles linear to open and diffuse, often purple-tinged to dark purple, the branches smooth or scabrous and often naked near the base; glumes diverse; plants to 7 dm tall; leaf blades flat to involute, 0.5–2 mm wide 3
- 3(2). Plants with any combination of characters cited in the leads in couplet 4 (the name a catchall for various indeterminate elements) *A. idahoensis*
- Plants matching in all details one of the leads in the following couplet 4
- 4(3). Panicles (8) 10–30 cm long, the branches mostly at least 5 cm long, naked for more than half their length, mostly strongly scabrous and rebranching above midlength, at maturity widely spreading to deflexed; glumes typically unequal, long-tapered to sharply acute or aristate tips, averaging at least 0.5 mm longer than the lemmas ...
- *A. scabra*

- Panicles 2–10 cm long, the branches to ca 3 cm long, often naked for less than half their length, typically smooth or sparingly scabrous, rebranching at or below midlength, at maturity erect to spreading; glumes mostly equal or very nearly so, often abruptly acute, averaging less than 0.5 mm longer than the lemmas *A. variabilis*
- 5(1). Anthers at maturity 1 mm long or longer; plants rhizomatous and often stoloniferous 6
- Anthers 0.5–0.8 mm long; plants with culms solitary or tufted, neither rhizomatous nor stoloniferous 7
- 6(5). Ligule of upper culm leaves 2.5–7 mm long; pedicels usually densely scabrous; primary panicle branches (at least the lowermost whorl) typically subtended by much shorter ones *A. stolonifera*
- Ligule of upper culm leaves 0.5–1.5 (2) mm long; pedicels smooth or sparingly scabrous; primary panicle branches not regularly subtended by much shorter ones *A. capillaris*
- 7(5). Spikelets ultimately disarticulating below the glumes and falling entire, the panicle branches bare in age; glumes usually averaging less than 2 (1–2.2) mm long; plants of valleys and foothills *Polypogon semiverticillatus* (q.v.)
- Spikelets disarticulating above the glumes; glumes persistent on the plant, averaging at least 2 (1.5–2.8) mm in length; plants of midmontane or above 8
- 8(7). Glumes mostly elliptical and barely exceeding the lemmas; lemmas ultimately whitish; panicles 1.5–15 cm long, the branches mostly 0.5–5 cm long, typically more or less angled and scaberulous; leaf blades 1–4 mm wide; culms 0.5–6 dm tall *A. thurberiana*
- Glumes mostly lanceolate to ovate and averaging ca 0.2 mm longer than the lemmas; lemmas often purple or purple-tinged; panicle 1–6 cm long, the branches mostly 0.5–2 cm long, typically terete and smooth or nearly so; leaf blades 0.3–2 mm wide; culms 0.3–2.6 dm tall *A. humilis*

Agrostis capillaris L. Colonial Bentgrass. [*A. tenuis* Sibth.]. Rhizomatous, sometimes stoloniferous perennial strongly resembling *A. stolonifera* but differing as follows: culms (1) 2–10 dm tall, the blades to 6 mm wide; ligule of upper culm leaves 0.5–1.5 (2) mm long; panicle to 2 dm long, erect to lax, the primary branches in the lowermost whorl not regularly subtended by distinctly shorter ones, the branches and pedicels capillary, glabrous or sparingly scabrous; glumes abruptly acute or gradually tapered to a sharply acute tip; lemma not infrequently awned, the awn arising below midlength, typically bent and often exceeding the glumes; palea 1/2–2/3 as long as the lemma. Native of Eurasia, introduced to the U. S. for use in lawns and for erosion control, grown primarily in the coastal regions of the Northeast and Northwest where Kentucky bluegrass is not well adapted, occasionally included in lawn seed sold locally, readily hybridizing with *A. stolonifera* (Widen 1971). Several specimens with characters suggesting intergradation between *A. capillaris* and *A. stolonifera* have been collected from disturbed areas below 1980 m in Salt Lake and Utah counties. I follow Widen (1971) and Tutin et al. (1980) in applying the binomial *A. capillaris* to this species; 1 (i).

Agrostis exarata Trin. Spike Bentgrass. Tufted perennial, often flowering the first year, occasionally developing slender rhizomes; culms (1) 2–10 (15) dm tall, usually erect; blades flat, (1.5) 2–11 mm wide, mostly 5–30 cm

long; ligule (2) 3–9 (14) mm long; panicle linear to narrowly elongate, somewhat loose to dense, (1.5) 3–20 (30) cm long and 0.6–3 cm wide, sometimes interrupted, the branches erect to slightly spreading at flowering, scabrous, mostly spikelet-bearing to the base or nearly so; spikelets green, occasionally purple-tinged; glumes narrowly lanceolate, equal or subequal, 1.8–4 mm long, typically long-tapered to a sharply acute or minutely awn-tipped apex, scabrous on the keel, usually at least some of the glumes within a panicle scaberulous or roughened over the back; lemma 1.2–2.5 (4) mm long, mostly 1/2–4/5 as long as the glumes, occasionally awned from about midlength, the awn to ca 5 mm long; palea ranging from rudimentary to 1/3 the length of the lemma; anthers 0.2–0.6 mm long; $2n = 28, 42, 56$. Streamside, margins of seeps in rocky areas, and in mesic to moist places in pinyon-juniper, aspen, spruce-fir, ponderosa pine, lodgepole pine, and meadow communities at 1520 to 3200 m in Beaver, Box Elder, Cache, Daggett, Duchesne, Emery, Garfield, Grand, Iron, Juab, Millard, Piute, Salt Lake, San Juan, Sanpete, Sevier, Summit, Tooele, Uintah, Utah, Wasatch, and Washington counties; Alaska to Saskatchewan, south throughout the western U. S. into Mexico, east to South Dakota, Nebraska, Oklahoma, and Texas; Siberia; 121 (viii). *Agrostis exarata* is here treated as a polymorphous species without recognizable infraspecific taxa following Simpson (1967). Occasional specimens (e.g., Stanton 594 UT; Genz 8750 BRY) appear to combine the characters of *A. exarata* and *A. scabra*, others (e.g., Arnow 5189 and 6134 UT) those of *A. exarata* and *A. stolonifera*. Spike bentgrass is an important source of montane forage, remaining green and palatable throughout the summer.

Agrostis humilis Vasey Alpine Bentgrass. [*Podagrostis humilis* (Vasey) Bjorkman]. Tufted perennial; culms 0.3–2.6 dm tall, erect; leaves chiefly basal; blades flat to involute, 0.3–2 mm wide, glabrous or scabrous to puberulent; ligule 0.5–3 (4) mm long; panicle linear to narrowly elongate or occasionally somewhat pyramidal, 1–6 cm long and to ca 1.5 cm wide when pressed, the branches mostly 0.5–2 cm long, erect or at flowering spreading, the pedicels often spreading, both branches and pedicels smooth or nearly so throughout; spikelets purple or purple-tinged, rarely green; glumes lanceolate to ovate or less often elliptical, equal or subequal, 1.5–2.5 (2.8) mm long, averaging ca 0.2 mm longer than the lemmas, often gradually tapered to a sharply acute to aristate apex, the margins generally ragged at 30x magnification; lemma typically green or purple-tinged to dark purple, 1.5–2.2 mm long, obscurely to distinctly nerved, the nerves often purple-stained at the obtuse, erose apex, the midnerve occasionally prolonged as a minute awn to ca 1 mm long; palea 2/3–3/4 the length of the lemma, the rachilla either not prolonged behind the palea or bristle-like and to 0.5 (0.7) mm long, rarely bearing a rudimentary floret; anthers 0.5–0.8 mm long; $2n = 14$. Wet meadows and other moist places, in openings in spruce-fir and lodgepole pine communities, and on open, rocky slopes chiefly at 2740 to 3350 m in Daggett, Duchesne, Juab, Salt Lake, Summit, Uintah, and Wasatch counties; Alaska and British Columbia, south throughout most of the western U. S.; 36 (iii). The differences between *A. humilis* and *A. thurberiana*, because they are chiefly quantitative, appear to be related to habitat or to stage of growth. It was found, however, that fruiting plants with

their roots essentially entwined could be readily segregated according to the characters provided in the key. Thus, the differences are neither a function of maturity nor of microhabitat, and the reality of two species is upheld. A few herbarium specimens display evidence of intermediacy, however, suggesting that hybridization does occasionally occur.

Agrostis idahoensis Nash Idaho Bentgrass. The binomial *A. idahoensis* has long been employed in umbrella-like fashion to cover a number of otherwise indeterminate elements. The name, which may be readily applicable to a single collection confined to a herbarium sheet, does not appear to apply to populations. In Utah, *A. idahoensis* is reported only from areas where *A. scabra*, *A. exarata*, or *A. variabilis* are also growing, and may represent intergradation among these species. It is relatively infrequent and, to my knowledge, does not form pure stands. The taxon is also reported from British Columbia and Alberta, south throughout the western U. S., as are *A. exarata* and *A. scabra*.

Agrostis scabra Willd. Ticklegrass. [*A. hyemalis* of authors, not (Walter) B.S.P.; *A. hyemalis* var. *tenuis* (Tuckerman) Gleason]. Short-lived perennial; culms solitary or tufted, 0.5–6 (7) dm tall, erect; blades 0.5–2 mm wide, flat to involute, essentially smooth or more often scabrous, occasionally pubescent above with short stiff hairs; ligule (1.2) 2–7 mm long, averaging at least 2 mm long; panicle elliptical to pyramidal, (8) 10–30 cm long and 0.5–20 cm or more wide, the branches to 12 cm long, erect to ultimately widely spreading or deflexed, typically strongly scabrous and rebranching at or above midlength, naked below; spikelets mostly purple at maturity; glumes subequal to unequal, the first longer than the second, 1.5–3 (4) mm long, mostly sharply acute to aristate, scabrous on the midnerve and often laterally roughened near the tip, exceeding the lemma by 1/3–1/2 their length; lemma (1) 1.5–2 mm long, occasionally awned from about midlength, the awn 0.5–2 mm long; palea lacking or rudimentary; anthers 0.3–0.7 mm long; $2n = 28, 42, 43$. Openings in mountain brush, aspen, spruce-fir, ponderosa pine, lodgepole pine, and meadow communities, rarely in oak-sagebrush and pinyon-juniper communities, at (1825) 2440 to 3350 m in Beaver, Cache, Carbon, Daggett, Duchesne, Emery, Garfield, Grand, Iron, Juab, Kane, Morgan, Rich, Salt Lake, San Juan, Sanpete, Sevier, Summit, Uintah, Utah, Wasatch, Washington, and Wayne counties; Alaska to Greenland, throughout most of the U. S. and in Mexico; Asia; naturalized in Europe and adventive elsewhere; 188 (xii). *Agrostis scabra* is here maintained as a species distinct from *A. hyemalis* of the eastern U. S. in accordance with recent treatments. *Agrostis scabra* appears to hybridize with *A. stolonifera* and *A. exarata* (q.v.).

Agrostis stolonifera L. Redtop; Carpet Bentgrass. [*A. alba* of authors, not L.; *A. gigantea* Roth; *A. palustris* Hudson]. Rhizomatous and often stoloniferous perennial, sometimes mat-forming; culms 0.2–1.5 m tall, erect or decumbent; blades mostly (1.5) 2–10 (12) mm wide, flat or folded, smooth to strongly scabrous; ligule of upper culm leaves (2) 2.5–7 mm long; panicles narrowly to broadly lanceolate or elliptical, 4–40 cm long and 1–15 cm wide, the branches erect to ultimately widely spreading, subglabrous to strongly scabrous, at least those in the lowermost whorl typically subtended by distinctly shorter branches; spikelets green or reddish purple;

glumes narrowly to broadly lanceolate or elliptical, equal or subequal, 1.5–3.5 mm long, averaging ca 0.3 mm longer than the lemma, abruptly acute and sometimes submucronate to short-tapered at the apex, usually scabrous on the midnerve and otherwise smooth to somewhat roughened; lemma 1.2–2.8 mm long, awnless or rarely short-awned from above midlength; palea 1/2–3/4 as long as the lemma; anthers 1–2 (2.3) mm long; $2n = 28–46, 56$. Along waterways (often partially or totally submersed in shallow running water), in marshes, wet meadows, and near seeps in greasewood, pinyon-juniper, aspen, and spruce-fir communities at 980 to 3050 m in all Utah counties except Morgan; native to Eurasia and North Africa, introduced to North America as a lawn and pasture grass prior to 1750 (Vallentine 1961) and now circumboreal; 272 (xiii). Some workers treat rhizomatous plants with panicles remaining open after flowering as *A. gigantea*, and stoloniferous ones with panicles contracted after flowering as *A. stolonifera*. In Utah, plants with panicles contracted and others with panicles open after flowering occasionally occur within the same tuft (e.g., Cottam 13470 and Arnow 4699 UT). Although Widen (1971) states that the presence or absence of stolons or rhizomes in this complex is habitat-related, he recognizes two species, separating them, in what appears to be an arbitrary break in a continuum of variation, by the occurrence in *A. gigantea* of rhizomes with more than three scale leaves. I have followed Scoggan (1978) and Sutherland (1986) in assigning *A. gigantea* to synonymy. *Agrostis stolonifera* is known to form hybrids with *A. capillaris* (Widen 1971) and, based on specimens examined, is evidently hybridizing with both *A. scabra* (Harrison 12360 UT; Gierisch 238 and 533 UTC; Goodrich s.n. BRY) and *A. exarata* (Harrison 12680 BRY). According to Tutin et al. (1980) and Tselev (1984), *A. stolonifera* also hybridizes with *Polygogon monspeliensis* (q.v.) and possibly with *P. semiverticillatus* (Arnow 5960 UT). Redtop is extensively used in turf culture, especially on golf courses. On moist sites it produces good forage throughout the growing season but is less productive and less palatable than most introduced grasses (Vallentine 1961).

Agrostis thurberiana A. S. Hitchc. Thurber Bentgrass. [*Podagrostis thurberiana* (A. S. Hitchc.) Hulthen]. Tufted perennial, often with short rhizomes; culms 0.5–6 dm tall; leaves chiefly basal or, in robust plants, the cauline leaves conspicuous; blades flat, 0.5–4 mm wide and to ca 10 cm long, glabrous or the margins scaberulous; ligule 1–4 mm long; panicle linear to narrowly oblong, 1.5–10 (15) cm long and mostly less than 2 cm wide, sometimes nodding, the branches capillary, mostly 0.5–5 cm long or more, erect to moderately spreading, naked below, the pedicels remaining appressed, the branches and pedicels typically scaberulous; spikelets pale green to purple; glumes mostly narrowly elliptical and equal or subequal, 1.5–2.5 (2.8) mm long, barely exceeding the lemma or occasionally a few of them distinctly longer, mostly abruptly tapered to an acute apex, often smooth on the midnerve, the margins typically smooth at 30x magnification; lemma greenish or ultimately white, sometimes faintly purple-tinged near the apex, 1.5–2.2 mm long, often more or less distinctly nerved, usually appearing acute unless spread out, awnless; palea 2/3–3/4 the length of the lemma, the rachilla often prolonged behind the palea as a bristlelike structure to 0.5 mm long, rarely bearing a rudimentary floret; anthers 0.4–0.7 mm long;

2n = 14. Wet meadows and other wet sites above 2620 m in Duchesne, Salt Lake, Uintah, and Wasatch counties; Alaska south throughout most of the western U. S.; 13 (ii).

Agrostis variabilis Rydb. Mountain Bentgrass. [*A. rossiae* of authors, not Vasey]. Tufted perennial; culms 0.6–3 (4) dm tall, erect; leaves chiefly basal; blades 0.3–2.5 (3) mm wide, flat to involute, smooth or scaberulous to puberulent; ligule 0.5–2.5 (3) mm long; panicle linear to narrowly elongate, 2–10 cm long and rarely more than 2 cm wide, erect, the branches to ca 3 cm long, erect to somewhat spreading, typically smooth or sparingly scabrous, rebranching at or below midlength; spikelets 1-flowered, green or more often purple-tinged to purple; glumes typically equal or subequal, 1.7–2.5 (3) mm long, slightly longer than the lemma, mostly abruptly acute apically, sometimes sharply so but rarely aristate, glabrous or the midnerve scabrous, sometimes scaberulous lateral to the midnerve near the tip; lemma whitish or some of them lightly purple-tinged, 1.5–2.2 mm long, 3- to 5-nerved, occasionally a short awn arising from the back at about midlength or above; palea lacking or rudimentary; anthers 0.3–0.7 mm long; 2n = 28. Mountain meadows, talus, streamside, and other mostly moist sites in spruce-fir and lodgepole pine communities at 2930 to 3570 m in Beaver, Duchesne, Garfield, Grand, San Juan, Summit, Uintah, and Washington counties; British Columbia and Alberta, south throughout most of the western U. S.; 53 (i). For many years *A. variabilis* was confused with *A. rossiae* Vasey, an annual endemic to Yellowstone National Park (Swallen 1948). Occasionally plants within populations of *A. variabilis* resemble *A. borealis* in being awned, but the panicle branches are not widely spreading as in the latter. *Agrostis borealis* is reported for Utah by Hitchcock (1951), but I have seen no Utah materials with both open panicles and consistently awned lemmas.

Alopecurus L.

Annuals or perennials; sheaths open; blades usually flat; ligule membranous; inflorescence a spike-like cylindrical panicle; spikelets 1-flowered, short-pedicelled, flattened, strongly overlapping, lanceolate to elliptical, disarticulating below the glumes; glumes laterally compressed, equal or nearly so, slightly shorter to barely longer than the floret, 3-nerved, the margins often fused near the base, the keel conspicuously ciliate; lemma strongly laterally compressed, the margins free or fused to some degree, awned from the back, the awn included or exerted; palea small or lacking; stamens 3; caryopsis free within the lemma and palea, the embryo 1/4–1/2 as long as the grain; x = 7.

1. Glumes sharply acute at the apex, averaging more than 3 (2.5–6) mm long; awn typically exerted 2 mm or more beyond the glumes; anthers 1.5–3.5 mm long 2
- Glumes obtuse at the apex, averaging no more than 3 (1.5–3) mm long; awn included within the glumes or variously exerted; anthers 0.3–1.8 mm long 3
- 2(1). Glumes pubescent throughout with more or less crinkly hairs, those along the keel mostly 1–2 mm long; panicles 1–4 (5.5) cm long *A. alpinus*
- Glumes pubescent chiefly on the keel with hairs less than 2 mm long; panicles 2–10 cm long *A. pratensis*
- 3(1). Awn included within the glumes or the exerted portion averaging less than 1.5 mm long; anthers 0.5–0.8 mm long *A. aequalis*

- Awn exerted, the exerted portion typically averaging more than 2 mm long; anthers various 4
- 4(3). Anthers 0.3–0.5 mm long; plants annual *A. carolinianus*
- Anthers 1–2 mm long; plants perennial *A. geniculatus*

Alopecurus aequalis Sobol. Shortawn Foxtail. Perennial, sometimes flowering the first year; culms 0.8–6 (7) dm tall, erect or geniculate and occasionally rooting at the lower nodes; blades flat, 0.6–6 mm wide, glabrous or scaberulous; ligule (2) 4–8 mm long; panicle spike-like, cylindrical, 1.5–8 (10) cm long and 3–6 (7) mm wide; spikelets strongly flattened, elliptical, 1.5–2.7 (3) mm long and to ca 1 mm wide, pale green, occasionally purple-tinged; glumes fused basally, obtuse apically, ciliate on the keel and often appressed-hairy on the lateral nerves, with or without shorter hairs over the back; lemma lance-ovate, 1.6–2.5 (3) mm long, obtuse, glabrous, the awn delicate, arising above or below midlength of the lemma, mostly 0.5–2.5 mm long, straight or slightly bent, included within the glumes or the exerted portion averaging less than 1.5 mm long; anthers 0.5–0.8 mm long; 2n = 14. Along waterways, in mostly wet, sometimes saline meadows and in other moist sites (occasionally partly submersed) in aspen, spruce-fir, lodgepole pine, and ponderosa pine communities at 1280 to 3200 m in all Utah counties except Carbon, Morgan, and Tooele; circumboreal, south in the U. S. throughout the West, most of the Great Plains, and east through New England; Argentina; Eurasia; 139 (iv).

Alopecurus alpinus J. E. Sm. Alpine Foxtail. Rhizomatous perennial; culms 1–8 dm tall, erect or somewhat geniculate below, solitary or in small tufts; blades usually flat, 1–7 mm wide, glabrous or scabrous; ligule 1–4 mm long; panicle spike-like, ovoid to cylindrical, 1–4 (5.5) cm long and to ca 16 mm wide; spikelets flattened, elliptical, (2.5) 3–5 (6) mm long and to ca 2 mm wide; glumes fused basally, acute apically, the keel and the lateral nerves typically outlined in dark purple, otherwise pale or suffused to some degree with purple, ciliate on the keel and densely pubescent throughout with more or less crinkly hairs 1–2 mm long or longer; lemma broadly elliptical, scaberulous to puberulent near the often purple-tinged apex, glabrous and pale below, the awn arising below or rarely above midlength of the lemma, straight or slightly bent, 3.5–7 mm long, the ultimately exerted portion averaging more than 2 mm long; anthers 1.8–2.8 mm long; 2n = 98, ca 100, 105, 110, 112, 113. Riparian, mesic to wet meadows, aspen, lodgepole pine, and ponderosa pine communities at (2320) 2740 to 3230 m in Daggett, Summit, and Uintah counties (Uinta Mts.); Alaska to Labrador, south in the Rocky Mts. to Colorado; Eurasia; 27 (0).

Alopecurus carolinianus Walter Carolina Foxtail. Annual; culms erect or geniculate at the lower nodes, 1–5 dm tall, solitary or tufted; blades flat, 1–4 (5) mm wide; ligule (1) 3–7 mm long; panicle spike-like, cylindrical, 2–6 (8) cm long and to ca 6 mm wide; spikelets flattened, elliptical, 1.8–2.5 mm long and to ca 1 mm wide, mostly pale green, occasionally with minute purple markings at the tips; glumes equal or nearly so, fused basally, obtuse apically, short-ciliate on the keel and usually hairy to some degree laterally; lemma lance-elliptical, obtuse, glabrous, the awn arising below midlength, typically geniculate, 3–5 mm long, the ultimately exerted portion averaging more than 2 (1–3) mm long; anthers 0.3–0.5

mm long; 2n = 14. Wet, often saline meadows and along waterways below 1520 m in Cache and Davis counties; Canada south throughout most of the U. S.; 3 (0).

Alopecurus geniculatus L. Marsh or Water Foxtail. Perennial, sometimes flowering the first year; culms erect or geniculate below, occasionally rooting at the lower nodes, 1–6 dm tall; blades flat, 2–6 (8) mm wide, glabrous or scaberulous; ligule 2–6 (8) mm long; panicle spike-like, cylindrical, 2–8 cm long and to ca 6 mm wide; spikelets strongly flattened, blunt-elliptical, 1.8–3 (3.5) mm long, 1–1.5 mm wide, green and usually purple-tinged; glumes fused basally, obtuse apically, short-ciliate on the keel and often appressed-hairy on the lateral nerves, with or without shorter hairs over the back; lemma lance-elliptical, obtuse, glabrous, the awn arising at or below mid-length of the lemma, straight or at maturity geniculate and often twisted, 1.5–4 (6) mm long, the ultimately exerted portion averaging at least 1.5 mm long; anthers 1–2 mm long; 2n = 14, 28. Wet meadows or seeps (sometimes partially submersed) in aspen and spruce-fir communities at 1320 to 3200 m in Cache, Garfield, Iron, Salt Lake, Sevier, Summit, and Wayne counties; native to Eurasia, sporadically adventive from Alaska to Greenland or possibly circumboreal, south in the U. S. through most of the West and the Northeast; 20 (i). Utah plants are unusual in having awns shorter than those of typical *A. geniculatus*. The species is often sympatric with the short-awned *A. aequalis*, and evidence of intergradation, which could explain the shorter awns, exists in specimens combining awns longer than is typical for *A. aequalis* with the very short anthers of that species. Hybrids between *A. geniculatus* and *A. pratensis* have been reported (J. Linn. Soc., Bot. 83: 285. 1981).

Alopecurus pratensis L. Meadow Foxtail. Perennial, occasionally with short rhizomes; culms tufted, erect or occasionally geniculate at the lower nodes, 2–12 dm tall; blades flat, 2–10 mm wide; ligule 1.5–6 mm long; panicle spike-like, cylindrical, (2) 3–10 cm long and to ca 14 mm wide; spikelets flattened, elliptical, (3.5) 4–6 mm long and 1.2–2.5 mm wide; glumes fused basally, sharply acute apically, the keel and the lateral nerves typically outlined in green or purple, the remainder pale or suffused to some degree with purple, ciliate on the keel with hairs to ca 1.5 mm long, otherwise glabrous or the lateral nerves appressed-hairy; lemma elliptical, acute, glabrous or occasionally pubescent on the upper portion of the keel, the awn arising near the base of the lemma, geniculate, 5–8 (10) mm long, the exerted portion 2–6 mm long; anthers 1.5–3.5 mm long; 2n = 14, 28, 42. Mesic to wet sites along roads, in pastures, meadows, and aspen-conifer communities at 1310 to 3230 m in Cache, Carbon, Daggett, Emery, Garfield, Salt Lake, Sanpete, Sevier, Summit, Tooele, Utah, and Wasatch counties; native to Eurasia, introduced to North America in the mid-1800s, now essentially circumboreal, south in the U. S. through much of the West and the Northeast; 44 (vii). Meadow foxtail has been used in Utah since about 1960 for range rehabilitation and erosion control. The closely related *A. arundinaceus* Poir. (creeping meadow foxtail) has reportedly been used for range seeding in Utah, but I have seen no specimens. It differs from *A. pratensis* chiefly in being more strongly rhizomatous and in having short, rarely exerted awns, and truncate rather than acute glumes and lemmas.

Andropogon L.

Perennial; culms erect, simple or branched above the base; sheaths open; blades flat, folded, or loosely involute; ligule membranous; inflorescence a panicle with (1) 2 to several, more or less digitately arranged spike-like branches; spikelets dorsiventrally compressed, 2-flowered, borne in pairs, one sessile, the other short-pedicelled (or lacking and represented only by the pedicel), the rachis disarticulating below the sessile spikelet, the spikelet pair falling as a unit together with the associated pedicel and rachis segment, the latter structures usually rounded on the abaxial side, not medially grooved; sessile spikelet with the lower floret neuter (often rudimentary) and the upper floret perfect or pistillate; pedicelled spikelet well developed to rudimentary or lacking; glumes lanceolate, 2- to several-nerved, at least the first more or less leathery to hardened, exceeding both florets, firmly clasping the often thinner, shorter, more or less keeled second glume; lemma hyaline, that of the upper floret (sessile spikelet) entire or 2-lobed apically, unawned or with a straight or geniculate, twisted awn arising from the apex or from between apical lobes; palea hyaline or lacking; stamens 1–3; caryopsis free of the lemma and palea, remaining enclosed within the glumes, the embryo about half the size of the grain; x = 9, 10. *Andropogon* and the closely related genera *Bothriochloa* nad *Schizachyrium* are treated as a single genus (*Andropogon*) by Sutherland (1986).

Gould, F. W. 1957. New North American andropogons of subgenus *Amphilophus* and a key to those species occurring in the United States. Madrono 14: 18–29.
———. 1967. The grass genus *Andropogon* in the United States. Brittonia 19: 70–76.

- 1. Sessile spikelets 6–12 mm long, the pedicelled spikelets averaging more than 3 (3–8) mm long *A. gerardii*
- Sessile spikelets 3–4.5 mm long, the pedicelled spikelets rudimentary or represented only by a pedicel
..... *A. glomeratus*

Andropogon gerardii Vit. Big Bluestem. [*A. furcatus* Muhl. in Willd.]. Perennial, occasionally with rhizomes; herbage often glaucous; culms usually tufted, 5–20 dm tall, sparingly branched above; sheaths glabrous or occasionally hairy along the margins near the ligule; blades (3) 5–10 mm wide, flat or loosely involute toward the long-tapered filiform tips; ligule of culm leaves 0.5–2.5 mm long, occasionally surpassed by long hairs from the base of the blade, a ligule lacking in blades subtending branches of the inflorescence; panicle of (1) 2–7, usually erect, loosely whorled, spike-like branches, these 4–11 cm long, the rachis internodes and pedicels sparsely to densely pubescent with ascending-spreading, white to yellow hairs mostly 2–6 mm long; sessile spikelet narrowly lanceolate, 6–12 mm long, the glumes dimorphic, the first ultimately hardened, dorsiventrally compressed, narrowly lanceolate, longitudinally concave to deeply grooved, glabrous or more often scabrous to some degree, the second thinner, shorter, and somewhat keeled, the upper floret usually perfect, the lemma awnless or with a geniculate, basally twisted awn to 2 cm long; pedicelled spikelet often broader than the pedicel, mostly 3–8 mm long (excluding the awn tip when present), the upper floret neuter or staminate, the lemma short-awned or awnless; anthers 3–5 mm long; 2n = 20, 40, 60, 80–86,

According to Gould (1975), two intergrading and often sympatric varieties are present in Utah:

1. Hairs of the rachis internodes copious, typically 3–4 mm long and whitish or yellow; rhizomes well developed *A. gerardii* var. *chrysocomus*
- Hairs of rachis internodes sparse to copious, mostly 1–2 mm long and whitish; rhizomes short or lacking *A. gerardii* var. *gerardii*

Var. *chrysocomus* (Nash) Fern. [*A. chrysocomus* Nash; *A. hallii* Hackel]. Dry sandy sites in desert shrub and pinyon-juniper communities at ca 1400 to 1770 m in Duchesne (a recent roadside introduction), Emery, Garfield, Kane, San Juan, and Wayne counties; Montana and the Dakotas, south to Arizona, New Mexico, Texas, and Mexico; 27 (0).

Var. *gerardii* Dry to moist sites in creosote bush, live oak, mountain brush, pinyon-juniper, and ponderosa pine communities at 850 to 1890 m in Emery, Garfield, San Juan, Washington, and Wayne counties; Saskatchewan to Quebec, and south through all except the westernmost states of the U. S.; 13 (0).

Andropogon glomeratus (Walter) B.S.P. Bushy Bluestem. [*Cinna glomerata* Walter]. Perennial; herbage often glaucous; culms densely tufted, mostly 7–15 dm tall, erect, typically much branched above; sheaths glabrous or long-hairy on the margins and sometimes near the collar, those of the upper branches ultimately reddish brown; blades 2.5–6 (8) mm wide, flat or folded, often becoming loosely involute toward the long-tapered, filiform tips; ligule a firm membrane to 1 mm long, anterior to and occasionally surpassed by long hairs arising at the base of the blade; inflorescence of mostly paired, slender branches 1.5–3 cm long terminating each of the numerous culm branchlets, and partially enclosed by the subtending sheaths, the whole leafy, broomlike, and mostly 1–3 dm long, rachis internodes and pedicels conspicuously pubescent with ascending-spreading, silvery hairs mostly 5–8 mm or more long; sessile spikelet narrowly lanceolate, 3–4.5 mm long, the glumes firm, the back dorsiventrally compressed and concave on the back, glabrous throughout or scabrous on the upper margins, the lemma of the upper floret with a slender, straight awn 1–2 cm long; pedicelled spikelet rudimentary or represented only by the pedicel; anthers 0.5–1.5 mm long; $2n = 20$. Hanging gardens and along streams at 1125 to 1160 m along Lake Powell, in Garfield, Kane, and San Juan counties; throughout the southern U. S., in northern Mexico, and the Atlantic coastal states south to Massachusetts; 8 (0).

Apera Adanson

Annuals; sheaths open; blades flat or involute; ligule membranous; inflorescence a panicle; spikelets flattened to subterete, 1-flowered, disarticulating above the glumes; glumes unequal, lanceolate, the first 1-nerved, the second 3-nerved and slightly exceeding the floret; lemma laterally compressed to subterete, firmer than the glumes, obscurely nerved, bearded on the callus, awned from just below the apex; palca equal to or slightly shorter than the lemma; stamens 3; caryopsis free within the lemma and palea, ellipsoidal, the embryo less than half as long as the grain; $x = 7$.

Apera interrupta (L.) Beauv. Italian Windgrass. [*Agrostis interrupta* L.]. Annual; culms solitary or tufted,

1–5 (7) dm tall, usually erect; sheaths smooth; blades lax, 1–4 mm wide, flat or involute when dry, glabrous or scaberulous; ligule 1.5–5 mm long; panicle narrowly elongate, (2) 3–20 cm long and 0.3–1.5 cm wide, compact to somewhat interrupted, especially below, the branches erect or slightly spreading, often spikelet-bearing to the base; spikelets 1-flowered, 2–3 mm long, green or purple-tinged; glumes lanceolate, laterally compressed to rounded on the back, membranous-margined, acute to minutely awn-tipped apically, scaberulous, especially toward the apex, the first 1.5–2.2 mm long, 1-nerved, the second 2–2.8 mm long, 3-nerved and slightly exceeding the floret; lemma at maturity firmer than the glumes, lanceolate, 1.6–2.5 mm long, minutely bearded on the callus, laterally compressed to rounded on the back, the margins completely enclosing the palea, scaberulous above midlength, the awn terminal or subterminal, hair-like or nearly so, (4) 6–16 mm long, straight or flexuous; anthers 0.3–0.5 mm long; $2n = 14, 28$. On open, mostly sandy sites, in greasewood communities or as a lawn weed below 1525 m in Cache, Salt Lake, and Tooele counties; native to Eurasia, now sporadic throughout much of the U. S. except in the South; South America; 11 (v). *Apera interrupta* is occasionally host to the smut fungus *Tilletia decipiens* (Pers.) Koern.

Aristida L.

Annuals or perennials, tufted or rhizomatous; sheaths open; blades narrow, usually involute; ligule a ring of hairs or a short, ciliate membrane; inflorescence an open to contracted panicle, raceme, or spike; spikelets terete to compressed, 1-flowered, disarticulating above the glumes; glumes equal or unequal, lanceolate, acute to acuminate or awn-tipped, 1- to 3-nerved, the second glume usually slightly exceeding the body of the lemma; lemma at maturity firmer than the glumes, lanceolate, rounded on the back with overlapping margins, 3-nerved, long-tapered toward the apex and terminating in 3 awns, these often fused at the base to form a slender awn column, the lateral awns sometimes partially or rarely totally reduced; callus hardened, more or less sharply pointed, usually bearded; palea entirely enclosed within and small relative to the lemma; stamens (1) 3; caryopsis free of but firmly enclosed within the lemma, ellipsoidal to narrowly cylindrical, the embryo $1/3$ – $2/3$ the length of the grain; $x = 11$. Species of *Aristida* are the only known host for the smut *Sorosporium consanguineum* Ellis & Everhart. This treatment of *Aristida* was reviewed by Kelly W. Allred.

Allred, K. W. 1984. Morphologic variation and classification of the North American *Aristida purpurea* complex (Gramineae). *Brittonia* 36: 382–395.

1. Plants annual; sheaths glabrous at the summit; awns not twisted at the base *A. adscensionis*
- Plants perennial; sheaths often hairy at the summit; awns ultimately twisted near the base 2
- 2(1). Glumes distinctly unequal, the second averaging at least 3–4 mm longer than the first; awns 1.5–12 cm long, equal or nearly so *A. purpurea*
- Glumes mostly equal or subequal; central awns 1–3.5 cm long, usually exceeding the lateral ones *A. arizonica*

Aristida adscensionis L. Sixweeks Threeawn. [*A. oligantha* authors, not Michx.]. Annual or occasionally perennial; culms 0.8–8 dm tall, branched from the base and from the lower nodes, erect or geniculate at nodes near the base; sheaths glabrous; blades to ca 10 cm long and 2.5 mm wide, involute, flexuous to stiffly ascending, usually puberulent; ligule a membranous-based ring of hairs to ca 1 mm long; panicle narrow, 2–22 cm long, compact to loose, the branches short, erect or slightly divergent; spikelets often purplish; glumes thin, unequal, narrowly lanceolate, 1-nerved, acute to rarely awn-tipped, the first (4) 5–9 mm long, the second 7–12 mm long; lemma narrowly lanceolate, 6–13 mm long, tapered toward the apex, an awn column short or lacking, the central awn 6–16 (25) mm long, the lateral ones slightly to occasionally much shorter, about equally divergent at maturity, often flattened but not twisted at the base; callus sharp, bearded, 0.5–1.2 mm long; anthers to ca 1 mm long; $2n = 22$. Known in Utah by a single collection (Harrison 12717 BRY) from a desert shrub community at ca 1280 m in Kane County; southwestern U. S., Texas, Kansas, Oklahoma, Missouri, and Mexico; South America; Africa and Eurasia; 1 (0).

Aristida arizonica Vasey Arizona Threeawn. Perennial; culms in small tufts, mostly 2–10 dm tall, stiffly erect; sheaths glabrous throughout or hairy at the summit; blades mostly 6–25 cm long and 0.5–3 (4) mm wide, flat or involute, the basal blades often loosely to strongly recurved, glabrous or scaberrulous to scabrid-puberulent; ligule a membranous-based ring of hairs to ca 0.5 mm long; panicle narrow, 5–25 cm long, erect to somewhat nodding, loosely few-flowered, the branches erect, the lowermost mostly 2–6 cm long; spikelets often reddish to purple; glumes equal or subequal, narrowly lanceolate, 8–18 mm long, acute to awn-tipped; lemma narrowly lanceolate, 10–16 mm long, tapered to an ultimately twisted awn column 3–6 mm long, the central awn 1–3.5 cm long, usually longer than the lateral ones; callus sharp, bearded, to ca 0.7 mm long; $2n = 22$. Dry sandy soil in desert shrub communities below 1520 m in Kane and San Juan counties; southwestern U. S., Texas, and Mexico; 3 (0).

Aristida purpurea Nutt. Purple Threeawn. [*A. fendleriana* Steudel; *A. glauca* (Nees) Walp.; *A. longiseta* Steudel; *A. wrightii* Nash]. Perennial; culms densely tufted, 0.4–8 (10) dm tall, erect; leaves often chiefly basal; sheaths often hairy at the summit, otherwise glabrous or nearly so; blades 2–25 cm long and 0.5–2 mm wide, involute or occasionally flat, stiffly ascending to strongly recurved, glabrous or scaberrulous to scabrous; ligule a membranous-based ring of hairs to ca 0.5 mm long; panicle narrow, (2) 5–20 (30) cm long, erect or nodding, loosely flowered, the branches appressed to ascending or the lowermost somewhat spreading; spikelets often reddish to purple; glumes unequal, narrowly lanceolate, acute to short-awned, the first (4) 7–14 mm long, the second (8) 11–25 mm long; lemma narrowly lanceolate, (7) 10–15 (17) mm long, tapered to a straight or somewhat twisted awn column mostly 1–6 mm long, the awns equal or nearly so, (1.5) 2–8 (12) cm long, terete or flattened near the base, often purple; callus sharp, bearded, to ca 1 mm long; anthers 1–2.5 mm long; $2n = 22, 44, 66, 88$. Creosote bush, salt desert shrub, oak-sagebrush, and pinyon-juniper communities at 820 to 2320 m in all Utah counties except Morgan, Rich, Summit, and Wasatch;

southwestern Canada, south in the U. S. throughout the western and most of the central states, and in Mexico; 385 (vi). Cronquist et al. (1977) first recognized the overall pattern of continuous variation in the *A. purpurea* complex, and treated it as a single species. A demonstration of polymorphism within closely spaced populations of the species corroborated their findings (Arnow et al. 1980). Based on a statistical analysis of the morphological variation within the complex, Allred (1984) recognized a single species with seven varieties. Much of our material, however, does not fit into the infraspecific categories described in his treatment; moreover, specimens that do, often occur within a single population. It would appear that in Utah, at least, the factors that render unsatisfactory recognition of more than one species also militate against recognition of infraspecific taxa. Where locally abundant, purple threeawn provides a moderate amount of forage during winter and early spring; but once the sharply pointed, coarsely awned lemmas begin to mature (and until they are shed), the grass is a source of irritation and trauma to the mouth parts of grazing animals (Vallentine 1961). In fact, one of the common names applied to this plant is "no eatum."

Arrhenatherum Beauv.

Perennials; sheaths open; blades flat; ligule membranous; inflorescence a panicle; spikelets subterete to compressed, usually 2-flowered, the florets nearly opposite, dissimilar, the rachilla prolonged beyond the upper floret as a bristlelike structure and disarticulating above the glumes; glumes unequal, laterally compressed and more or less keeled, acute; lemma firmer than the glumes, laterally compressed to rounded on the back, acute, 5- to 9-nerved, the callus or pedicel base glabrous or bearded, the lemma of the lower floret with a stout awn arising from below midlength, that of the upper floret awnless or with a shorter, more slender, subterminal awn; palea hyaline, shorter than the lemma; stamens 3; carypopsis free within the lemma and palea, narrowly oblong, the embryo not more than 1/3 the length of the grain; $x = 7$.

Arrhenatherum elatius (L.) Presl Tall Oatgrass. [*Avena elatior* L.]. Short-lived perennial; culms occasionally bulblike at the base, loosely tufted, erect, (6) 7–18 dm tall; sheaths glabrous or sparsely hairy; blades flat, (1) 2–10 mm wide, scaberrulous on the margins and occasionally sparsely hairy; ligule 0.5–3 mm long, truncate to obtuse; panicle narrowly oblong, (5) 10–30 cm long, loose or more or less compact; spikelets narrowly lanceolate, (6) 7–10 mm long, glistening, 2-flowered, the florets dissimilar, the lower staminate or neuter with an awned lemma, the upper pistillate or perfect with an awnless or bristle-tipped lemma, the two florets falling as a unit; glumes membranous, the first 3.5–7 mm long, 1-nerved, the second 7–10 mm long, 3-nerved, shorter than the lower floret to longer than the upper one; lemma 7–10 mm long, mostly 7- to 9-nerved, scabrous or sometimes sparsely short-hairy, the callus bearded or occasionally glabrous, some of the nerves occasionally prolonged as minute teeth, the lemma of the lower floret with a stout, twisted, geniculate awn 1–2 cm long arising just below midlength, that of the upper floret awnless or with a subterminal awn shorter and more slender than that of the lower lemma; anthers 4–5 mm long; $2n = 14, 28, 42$. Roadsides, streambanks, fields, and seeded areas in oak-sagebrush, aspen, spruce-fir, ponderosa pine, and meadow communities

at 1310 to 3110 m in Beaver, Box Elder, Cache, Carbon, Davis, Duchesne, Juab, Millard, Morgan, Piute, Salt Lake, San Juan, Sanpete, Sevier, Summit, Tooele, Utah, Wasatch, and Weber counties; native to Eurasia, now circumboreal, south throughout the western and north-eastern U. S.; South America; 43 (vi). Tall oatgrass was introduced in the U. S. as a pasture grass in 1807 (Valentine 1961). It is widely used for revegetation in mountain brush, aspen, and subalpine meadows.

Arundo L.

Tall, rhizomatous perennials; culms stout, hollow; blades flat; ligule a ring of hairs or a ciliate membrane; inflorescence a large, much branched panicle; spikelets 2- to 7-flowered, terete or compressed, the rachilla glabrous, disarticulating above the glumes and between the florets; glumes membranous, subequal, about as long as the florets, 3 (5) -nerved; lemma membranous, rounded on the back, 3- to 5-nerved, pubescent with long silky hairs; palea hyaline; stamens (2) 3; caryopsis free of and loosely enclosed by the lemma and palea, oblong, terete; $x = 12$.

Arundo donax L. Giant Reed. Perennial from thick knotty rhizomes; culms subligneous in age, densely tufted, mostly 2-6 m tall and 1-4 cm in diameter; sheaths glabrous; leaves chiefly cauline; blades flat, (1) 2-6 cm wide, long-tapered to a sharply acute tip, scabrous on the margins; ligule a minutely ciliate membrane to ca 1 mm long; panicle plumelike, (2) 3-7 dm long and to ca 1 dm wide, much branched, densely flowered, tawny or greenish and often purple-tinged; spikelets subterete to compressed, narrowly lanceolate, 8-15 mm long, mostly 2- to 4-flowered, the florets all perfect or the uppermost neuter, the rachilla glabrous, the florets progressively smaller upward, all terminating in approximately the same plane; glumes membranous, subequal, lanceolate, 10-14 mm long, more or less keeled to rounded on the back, tapered to a sharply acute tip, the whole about equal to the body of the uppermost lemma; lemma membranous, lanceolate, mostly rounded on the back, to ca 13 mm long, obscurely 3- to 9-nerved, acute at the apex or the nerves prolonged, the lateral as minute bristlelike teeth, the midnerve as an awn 0.5-3 mm long, the back pubescent over at least the lower half with soft hairs 6-9 mm long; palea ca 2/3 as long as the lemma; fertile caryopses seldom developing. Disturbed sites and margins of gardens at 850 to 1250 m in Washington County; native to Eurasia, widely cultivated as an ornamental, and established from California to New Mexico, Mexico, and occasional eastward; 2 (0).

Avena L.

Annuals; sheaths open; blades flat, broad; ligule membranous; inflorescence a large, open, nodding panicle or raceme; spikelets large, pendulous, 2- to 6-flowered, disarticulating above the glumes and between at least the lowermost florets; glumes lanceolate, equal or nearly so, some laterally compressed, 3- to 11-nerved, longer than the lower floret and often exceeding the uppermost; lemma firm, lanceolate to lance-ovate, rounded on the back, (5) 7-nerved, notched at the apex, awnless (in cultivars) or the awn arising from the back; callus 1-7 mm long, usually acute, glabrous or bearded; palea shorter than the lemma; stamens 3; caryopsis adherent to the lemma and palea or, in cultivated forms, free-threshing; $x = 7$.

Baum, B. R. 1968. On some relationships between *Avena sativa* and *A. fatua* (Gramineae) as studied from Canadian material. *Canad. J. Bot.* 46: 1013-1022.

Avena fatua L. Oats. Annual; culms solitary or in small tufts, (2) 3-19 dm tall; sheaths glabrous or sparsely long-hairy; blades flat, (1) 3-15 mm wide, usually scabrous, at least on the margins, sometimes sparsely hairy; ligule 2-6 (7) mm long; inflorescence a panicle or in depauperate plants a raceme 0.4-4 dm long; spikelets mostly 8-30 per inflorescence, 1.5-5 cm long, borne on slender drooping pedicels to ca 5 cm long, 2- to 3 (4) -flowered, the florets above the first two usually greatly reduced; glumes broadly lanceolate, subequal, 1.6-3 cm long, rounded on the back, usually long-tapered to an acute membranous tip, 7- to 11-nerved, surpassing the lower and often the uppermost florets; lemma ultimately hardened, rounded on the back, 1.4-2 cm long, notched at the membranous apex, glabrous throughout or hairy on the lower half, awnless or the awn arising near midlength, varying from slender, short, and more or less straight to stout, 2-5 cm long, and geniculate; anthers 4-5 mm long. Two intergradient varieties are recognized:

1. Spikelets usually 3- or 4-flowered; lemmas pubescent with stiff, usually reddish brown hairs, bearing a stout geniculate awn mostly 2-5 cm long *A. fatua* var. *fatua*
- Spikelets usually 2-flowered; lemmas glabrous, awnless or the awn poorly developed *A. fatua* var. *sativa*

Var. *fatua* Wild Oats. Roadsides, ditchbanks, wet meadows, fallow fields, and among annual crops at 850 to 2620 m in Cache, Carbon, Duchesne, Salt Lake, Sanpete, Sevier, Utah, Wasatch, Washington, and Wayne counties, and to be expected wherever cereal crops are grown; native to Eurasia, now circumboreal, south through much of the U. S.; South America; 23 (i).

Var. *sativa* (L.) Hausskn. Oats. [*A. sativa* L.]. Widely grown in Utah as food for humans and livestock, escaping and common as a waif in agricultural regions; native to Eurasia; widely cultivated in temperate regions of the world; 14 (0). The varieties of *A. fatua* are often treated at the specific level. The cultivated variety is derived from *A. fatua*, however, and, because the taxa intergrade freely, the characters used to distinguish them are by no means consistently correlated. The treatment of Gould and Shaw (1983) is followed here. The stout awn of var. *fatua* may cause mechanical injury to mouth parts of grazing animals. Moreover, oat hay is one of the most common sources of plant-related nitrate poisoning, evidently resulting from moisture accumulation on outdoor haystacks. Oats are also among the crops that can produce mineral imbalance in cattle, giving rise to the syndrome known as grass tetany (Kingsbury 1964).

Beckmannia Host

Annuals or perennials; culms moderately stout; sheaths open; blades broad and flat; ligule membranous; inflorescence a panicle consisting of racemously arranged, erect to ascending, simple or sparingly rebranched, spikeletlike branches, the sessile to subsessile, obovate spikelets closely overlapping in two rows along one side of the rachis, 1- or 2-flowered, disarticulating below the glumes and falling entire; glumes laterally compressed but typically somewhat inflated, equal, slightly shorter than the spikelet, 3-nerved, rounded to an obtuse to

abruptly apiculate apex; lemma lance-fusiform, 5-nerved, rounded on the back, tapered to a slender, acute, included or exerted tip; palea slightly shorter than the lemma; stamens 3; caryopsis free within the lemma and palea, to ca 2 mm long, 3-angled, the embryo 1/4–1/3 the length of the grain; $x = 7$.

***Beckmannia syzigachne* (Steudel) Fern.** American Sloughgrass. [*Panicum syzigachne* Steudel; *B. eruciformis* of American authors, not (L.) Host]. Annual; herbage light green; culms 3–12 dm tall, solitary or loosely tufted; blades 3–12 mm wide, flat, scabrous; ligule 4–11 mm long; panicle narrow, 0.7–3.5 dm long, the 1-sided, spike-like branches erect or strongly ascending, (0.7) 1–4 (5) cm long, simple or a few of them rebranched, spikelet-bearing to the base; spikelets pale green, obovate, 2–3.2 mm long (excluding the awn tip) and about as wide as long, sessile or nearly so and closely overlapping in 2 rows arising from one side of the rachis, 1-flowered, occasionally with a reduced second floret; glumes equal, boat-shaped, typically inflated to some degree, rounded to an apiculate apex; lemma narrow, subterete, the slender, sharply pointed tip to ca 0.8 mm long, exerted beyond the glumes for ca 1 mm; anthers 0.4–1 mm long; $2n = 14$. Wet, rarely saline meadows and marshes, and along waterways, at 1220 to 2740 m in Box Elder, Cache, Carbon, Daggett, Duchesne, Emery, Garfield, Morgan, Piute, Rich, Salt Lake, Sanpete, Sevier, Summit, Uintah, Utah, Wasatch, Wayne, and Weber counties; Alaska to Greenland, throughout the western U. S., east to Kansas, Iowa, and the Great Lakes region; Eurasia; 65 (ii).

***Blepharidachne* Hackel**

Monoclinous or monoecious annuals or perennials; culms low, tufted; leaves crowded near the base; sheaths open; blades firm, flat to involute; ligule a ring of short hairs or lacking; inflorescence a short compact panicle, often overtopped by the subtending leaves; spikelets subsessile or short-pedicelled, laterally compressed, 4-flowered, disarticulating above and often below the glumes but not between the florets, the first and second florets generally neuter or staminate, the third pistillate or perfect, the fourth reduced to a 3-awned rudiment; glumes thin, subequal, 1-nerved, generally keeled; lemmas dimorphic, the lower three slightly firmer than the glumes, rounded on the back, 3-nerved, deeply lobed to about midlength or below, the midnerve largely free as an awn and the lateral nerves often prolonged as minute awns, the uppermost lemma a 3-awned, bristlelike rudiment; palea of the neuter or staminate florets greatly reduced, that of the perfect or pistillate floret about equal to the body of the lemma; stamens (1) 2 or 3; caryopsis free of the lemma and palea, oblanceolate, laterally compressed; $x = 7$ (?).

Hunziker, A. and A. M. Anton. 1979. A synoptical revision of *Blepharidachne* (Poaceae). *Brittonia* 31: 446–453.

***Blepharidachne kingii* (Wats.) Hackel** King Desertgrass. [*Eremochloe kingii* Wats.]. Monoclinous perennial; culms densely tufted, erect to spreading, 0.2–1 (1.4) dm tall, not rooting at the nodes; leaf sheaths short and broad, membranous-margined, often hairy near the base and minutely to conspicuously so at the summit; blades firm, arcuate, folded or involute and in that state less than 1 mm wide, pungent-tipped, more or less scaberulous;

ligule a ring of hairs to ca 0.5 mm long, longer hairs often present along the sheath margins; panicle headlike or nearly so, 1–2.5 cm long, subtended by 1 or 2 leaves, ultimately at least partially emergent from the sheaths, often exceeded by the upper culm blades; spikelets 6–8.5 mm long, pale or occasionally purple-tinged, 4-flowered, the internodes of the rachilla very short, the florets forming a basally hairy, fan-shaped cluster; glumes thin, broadly lance-elliptical, sharply acute to awn-tipped, 6–8.5 mm long overall, typically keeled, usually scaberulous to minutely hairy near the base, especially on the midnerve, as long as or longer than the florets, often slightly exceeded by the awns of the lemma; lemmas dimorphic: the first two 3.4–5.8 mm long, lobed to about midlength, the midnerve largely free as a plumose awn 3–5 mm long, the lateral nerves prolonged beyond the lobes or not, the margin conspicuously ciliate; third lemma similar to the lower 2 but often glossy and not ciliate laterally below midlength; fourth lemma a 3-awned, bristlelike rudiment; palea of the neuter florets about half as long as the lemmas, very narrow, the keels ciliate, the palea of the fertile floret subequal to the lemma; stamens 2, the anthers 1.5–2 mm long; $2n = 14$ (Reeder, *Amer. J. Bot.* 64: 104. 1977). Greasewood, desert shrub, and sagebrush communities at 1070 to 1830 m in Beaver, Box Elder, Juab, Millard, and Tooele counties; California and Nevada; 43 (i). *Blepharidachne kingii* outwardly resembles *Erioneuron pulchellum* (q.v.), but the structure of the spikelet is distinctive.

***Blepharoneuron* Nash**

Perennials; sheaths open; ligule membranous; inflorescence a panicle; spikelets 1-flowered, disarticulating above the glumes, typically dark gray; glumes thin, 1- to 3-nerved; lemmas 3-nerved; palea about equal to the lemma; stamens 3; caryopsis free within the lemma and palea, the embryo about half the length of the grain; $x = 5$. *Blepharoneuron* is a monotypic North American genus.

***Blepharoneuron tricholepis* (Torr.) Nash** Hairy or Pine Dropseed. [*Vilfa tricholepis* Torr.]. Tufted, sometimes ring-forming perennial; culms erect, 1.5–7 (8.5) dm tall; leaves chiefly basal; sheaths glabrous; blades mostly 0.5–2 mm wide, flat to more often involute, scabrous; ligule mostly 0.5–2 mm long; panicle narrowly oblong to pyramidal, 4–20 (22) cm long, loosely contracted to open, the primary branches smooth or scabrous, the hairlike pedicels smooth, mostly 2–9 mm long; spikelets 1-flowered, subterete, 2–3.8 mm long, gray green to blackish and sometimes obscurely purple-tinged; glumes thin, oblong-elliptical, equal or unequal, typically rounded on the back, glabrous, abruptly acute to rounded at the apex, obscurely 1- to 3-nerved, the first 1.5–2.5 mm long, the second 1.7–2.8 (3.2) mm long, averaging shorter than the lemma; lemma firmer than or similar to the glumes in texture, elliptical, 2–3.2 (3.8) mm long, acute to obtuse at the apex, 3-nerved, each nerve densely hairy over at least the lower 1/3, the hairs appressed to spreading, the midnerve often minutely prolonged; palea densely hairy between the 2 nerves, appearing 1-nerved; anthers 1.4–2 mm long; $2n = 16$. Openings in ponderosa pine, lodgepole pine, aspen-spruce-fir communities, occasionally in sagebrush, mountain brush, and meadow communities, at 1980 to 3200 m in Beaver, Daggett, Duchesne, Garfield, Iron, Juab, Piute, San Juan, Sevier, Summit, Uintah, Wasatch, Washington, and Wayne counties; Col-

orado, Arizona, New Mexico, Texas, and Mexico; 69 (i). Pine dropseed is a good source of forage in those areas of the Uinta Mts. and the high plateaus where it is the dominant grass (Cronquist et al. 1977).

Bothriochloa Kuntze

Perennials; culms simple or sparingly to much branched above, glabrous or hairy at the nodes; sheaths open, occasionally somewhat keeled; blades flat to loosely involute; ligule membranous; inflorescence a panicle of 2 to numerous, digitate to closely spaced, spike-like, disarticulating branches, these simple or in some species rebranched, at least the lower ones often partially included in the upper sheath, the spikelets arranged on the rachis in pairs, one in each pair sessile, the other short-pedicelled, the rachis disarticulating below the sessile spikelet, the latter falling together with the associated spikelet, pedicel, and rachis segment, the pedicels and at least the terminal rachis segments flat and vertically grooved, the central portion membranous, the margins more or less thickened; spikelets lanceolate, 2-flowered, the sessile spikelet with the lower floret neuter (often rudimentary) and the upper floret perfect or pistillate, the pedicelled spikelet rudimentary or well developed, with the upper floret staminate or neuter; glumes firm, narrowly lanceolate, exceeding both florets, prominently to obscurely several-nerved, the first equal to or slightly longer than the second; lemma hyaline, that of the well-developed floret of the sessile spikelet entire or 2-lobed apically and usually bearing a geniculate, twisted awn arising from the apex or from between the apical lobes; palea hyaline or lacking; stamens 3; caryopsis free of but often remaining enclosed within the lemma and palea, the embryo 1/2–2/3 the length of the grain; $x = 10$. This treatment was reviewed by Kelly W. Allred.

Allred, K. W. and F. W. Gould. 1983. Systematics of the *Bothriochloa saccharoides* complex (Poaceae: Andropogoneae). Syst. Bot. 8: 168–184.

1. Pedicelled spikelets about equal in size to the sessile ones; internodes of the panicle branch with hairs averaging less than 3 mm long *B. ischaemum*
- Pedicelled spikelets smaller and narrower than the sessile ones; internodes of the panicle branch with hairs averaging more than 3 mm long 2
- 2(1). Sessile spikelets averaging less than 4 (2.5–4.5) mm long; awns typically averaging less than 15 (8–18) mm long *B. laguroides*
- Sessile spikelets (4) 5–7.3 mm long; awns 15–30 mm long 3
- 3(2). Main axis of the panicle less than 5 cm long, nearly always shorter than the branches; branches 2–9 per panicle, 4–7 cm long; upper culm nodes with hairs mostly 3–7 mm long *B. springfieldii*
- Main axis of the panicle often more than 5 cm long, mostly equal to or longer than the surrounding branches; branches often more than 9 per panicle, 2–9 cm long; upper nodes of culm with hairs mostly 1–2(3) mm long *B. barbinodis*

Bothriochloa barbinodis (Lag.) Herter Cane Bluestem. [*Andropogon barbinodis* Lag.]. Perennial; herbage often glaucous; culms densely tufted, mostly 6–15 dm tall, erect or sometimes geniculate at the lower nodes, usually becoming decumbent and much branched below in age, sparingly or not at all branched above, the

nodes pubescent with erect to spreading hairs mostly 1–3 mm long; sheaths glabrous; blades flat, mostly 2–7 (10) mm wide, often becoming loosely involute toward the long-tapered tips, glabrous or scabrous, the base of the blade usually long-hairy and the collar often puberulent, the uppermost culm blades typically greatly reduced; ligule 1–2.5 mm long, often surpassed by the few to numerous, long stiff hairs arising from the base of the blade; panicle whitish to tan, 4.5–13 cm long, contracted to somewhat open, often partially included in the upper sheath, the few to numerous, suberect to spreading branches mostly 2–9 cm long, the main axis mostly equal to or longer than the branches, the rachis segments and the pedicels pubescent along the thickened margins with dull white hairs mostly 5–9 mm long, at least those rachis segments and pedicels near the tips of the branches with a membranous-based medial groove; sessile spikelet lanceolate, (4) 5–7.3 mm long, typically partially obscured by the long hairs of the rachis, the glumes firm, the first flat to centrally concave, usually sparsely hairy below midlength, occasionally with a centrally located glandular pit or depression, the lemma of the well-developed floret bearing a geniculate, basally twisted awn 15–30 mm long; pedicelled spikelet rudimentary, not much wider than the pedicel, 3–5 mm long, often early deciduous; anthers 0.5–1.3 mm long; $2n = 70, 80, 90, 120, 180$. Chiefly in dry, sandy, gravelly, or rocky sites in desert shrub, pinyon-juniper, and ponderosa pine communities at 920 to 1830 m in Garfield, Grand, Kane, San Juan, Washington, and Wayne counties; southwestern U. S., Oklahoma, Texas, and into Mexico; South America; 23 (0).

Bothriochloa ischaemum (L.) H. Keng Yellow Bluestem. [*Andropogon ischaemum* L.]. Perennial; herbage yellow green; culms tufted, mostly (3) 4–10 dm tall, erect or sometimes decumbent to prostrate at the base, simple or sparingly branched above the base, the nodes glabrous or short-hairy; leaves chiefly basal; sheaths glabrous; blades flat, often becoming loosely involute toward the long-tapered tips, mostly 1–4 mm wide, usually sparsely long-hairy with papilla-based hairs at least along the margins near the ligule, the uppermost culm blades greatly reduced; ligule to ca 1 mm long, minutely ciliate; panicle 4–10 cm long, reddish purple, well exerted above the uppermost leaf, the 2–10 spike-like branches digitate or nearly so, ascending to spreading, mostly 3–9 cm long and infrequently rebranched, the pedicels and rachis segments pubescent along the thickened margins with hairs to ca 3 mm long, at least those rachis segments and pedicels near the tips of the racemes with a medial groove; sessile spikelet lanceolate to elliptical, 3–5 mm long, the glumes firm, the first flat or shallowly concave, never with a glandular pit or depression, glabrous or scabrous above and often short-hairy below midlength, the lemma of the well-developed floret bearing a geniculate, basally twisted awn mostly 10–15 mm long; pedicelled spikelet staminate, about equal in size to the sessile one, awnless, the first glume glabrous or hairy below midlength; anthers ca 2 mm long; $2n = 40, 50, 60$. Known in Utah by a single population (Welsh & Neese 23066 BRY) from a roadside area at ca 1400 m in Utah County; native to Eurasia, introduced in the southwestern U. S. and in Mexico as a pasture grass, and occasionally escaping cultivation; 2 (0).

Bothriochloa laguroides (DC.) Herter Silver Bluestem. [*Andropogon laguroides* DC.; *A. saccharoides* au-

thors, not Swartz; *A. saccharoides* var. *torreyanus* (Steudel) Hackel; *B. saccharoides* var. *torreyana* (Steudel) Gould]. This species is closely related to but differs from *B. barbinodis* as follows: plants less robust with more slender culms, leaves more basally clustered, leaf blades glabrous; panicle branches mostly 1–4 cm long and erect to strongly ascending; sessile spikelet 2.5–4 (4.5) mm long, lacking a glandular pit, the awns 8–16 mm long; pedicelled spikelet about as wide as the pedicel and 2.5–3 (4) mm long; $2n = 60$. Dry, usually sandy sites, often along roadsides below 1520 m in Kane (Welsh 11881 BRY) and Grand (Allred 1765 BRY) counties; Great Plains, with isolated stations in Utah, Missouri, Georgia, and Alabama; Mexico; South America; 2 (0). Allred and Gould (Syst. Bot. 8: 168–184, 1983) recognize several species within the *B. saccharioides* complex, separating *B. laguroides* from the remainder of the complex on the bases of chromosome number (*B. saccharoides*, $2n = 120$), leaf pubescence, width of the medial groove of rachis and pedicels, and the presence or absence of axillary pulvini. Our plants are ssp. *torreyana* (Steudel) Allred & Gould, differing from the southern element of the species in having spikelets visible through the subtending hairs, sheaths glabrous at the summit, and culm nodes nearly always bearded (Allred & Gould 1983).

Bothriochloa springfieldii (Gould) Parodi Springfield Bluestem. [*Andropogon springfieldii* Gould]. This species is similar to and commonly identified as *B. barbinodis* but differs from that species as follows: culms 3–8 dm tall, the nodes densely hairy with spreading hairs mostly 3–7 mm long; sheaths often densely hairy on the margins below the summit; leaf blades 2–3 (4.5) mm wide, sometimes sparsely hairy on the ventral surface; panicles densely white-hairy, with 2–9 spikelike branches 4–7 cm long, the main axis of the panicle less than 5 cm long, often surpassed by the branches, these infrequently once rebranched near the base, the rachis segments and pedicels densely pubescent with bright white hairs 5–10 mm long; sessile spikelets 5.5–8.5 mm long. Sandstone cliffs and ledges, along waterways, and in desert shrub communities at 1130 to 1770 m in Garfield, Grand, Kane, San Juan, and Wayne counties; Arizona, New Mexico, Texas, Louisiana, and northern Mexico; South America; 16 (0).

***Bouteloua* Lag.**

Annuals or perennials; culms often sparingly branched above the base; leaves chiefly basal; sheaths open; blades flat to involute; ligule a ring of hairs or a short ciliate membrane; inflorescence a panicle of 1 to numerous, short, spikelike, secund branches, these racemously ranged along a main axis, either disarticulating at the base and falling entire or persistent on the main axis, each branch with 1 to numerous, sessile or subsessile spikelets strongly to loosely overlapping in 2 closely spaced rows along one aspect of a subterete to flattened axis, the branch axis sometimes prolonged beyond the terminal spikelet as a naked, needlelike tip; spikelets with 1 perfect floret and usually with 1 or 2 (3) reduced florets (rudiments) above the perfect one, the rachilla disarticulating above the glumes or remaining intact in those species with deciduous branches; glumes subequal or unequal, lanceolate to elliptical, 1-nerved, the second (outer) shorter to slightly longer than the lowermost lemma; lemma of the perfect floret lanceolate, usually minutely bearded on the callus,

rounded on the back to laterally compressed and keeled, 3-nerved, the lateral nerves marginal or nearly so, frequently the midnerve and often the lateral ones prolonged as awns; palea of the perfect floret usually well developed, the 2 nerves sometimes prolonged as minute awns; lemma of the reduced florets present or absent, that of the first rudiment usually 3-awned or reduced to awns, that of the upper rudiment(s) often scalelike and awnless; stamens 3; caryopsis free within the lemma and palea, the embryo about half the length of the grain; $x = 10$.

Gould, F. W. 1979. The genus *Bouteloua*. Ann. Missouri Bot. Gard. 66: 345–416.

- 1. Branches of the inflorescence readily disarticulating at the base and falling entire, each branch with 1–8 (13) spikelets 2
- Branches of the inflorescence persistent on the culm, each branch with 8 to numerous spikelets 3
- 2(1). Plants annual; panicle branches 4–15 (20) per culm, mostly ascending-spreading *B. aristidoides*
- Plants perennial; panicle branches typically (13) 20–80 per culm, spreading to pendulous *B. curtipendula*
- 3(1). Culms white-woolly, especially on the lower internodes *B. eriopoda*
- Culms glabrous or scabrid-puberulent, not at all woolly . . . 4
- 4(3). Rachis prolonged beyond the terminal spikelet as a hard, needlelike tip 5–20 mm long *B. hirsuta*
- Rachis terminating in a rudimentary or well-developed floret 5
- 5(4). Plants annual 6
- Plants perennial 7
- 6(5). Inflorescence typically a single spikelike branch; second glume 3.5–5.5 mm long *B. simplex*
- Inflorescence of (1) 2–9 spikelike branches; second glume 1.3–3 mm long *B. barbata*
- 7(5). Rachis terminating in one or more rudimentary spikelets; rudimentary floret long-bearded from the base *B. gracilis*
- Rachis terminating in a well-developed spikelet; rudimentary floret not long-bearded from the base *B. trifida*

Bouteloua aristidoides (H.B.K.) Griseb. Needle Grama. [*Dinebra aristidoides* H.B.K.]. Annual; culms tufted, slender, 0.6–3 (5) dm tall, erect or geniculate to decumbent below; sheaths glabrous or more often ciliate with long hairs near the summit; blades 0.5–2 mm wide, flat to involute, glabrous or sparsely long-hairy; ligule a minute ciliate membrane or entirely of hairs; panicle of 4–15 (20) slender, loosely spaced, appressed to widely spreading or occasionally pendulous, spikelike branches mostly 1–2 cm long, the branches disarticulating at the base and falling as a unit, the axis densely pubescent at the base, prolonged beyond the point of origin of the terminal spikelet as a flattened, naked tip 5–11 mm long; spikelets 1–6 per branch, mostly 5–7 mm long including the awn tips, terete or nearly so, typically closely appressed to the branch rachis, only the lowermost spikelet on each branch usually without a rudimentary floret above the perfect one; glumes relatively firm, very unequal, the outer slightly shorter to longer than the fertile lemma; lemma of the lower floret firm, rounded on the back, the callus sharp, bearded, the body to ca 4 mm long, acute or

awn-tipped to long-awned, the anthers ca 2 mm long; all but the lowermost spikelet of each branch with a solitary rudiment consisting of a short stalklike base terminating in 3 awns 2–6 mm long; $2n = 40$. Dry open slopes, in rock crevices, along washes and roadsides in desert shrub and Joshua tree communities at 1070 to 1830 m in Garfield, Kane, and Washington counties; California to New Mexico, Texas, and Mexico; South America; 8 (0).

Bouteloua barbata Lag. Sixweeks Grama. [*B. rothrockii* authors, not Vasey]. Annual; culms tufted, slender, 0.2–3 (6) dm tall, erect or geniculate to sprawling or prostrate, occasionally rooting at the lower nodes, glabrous; leaves well distributed along the culm; sheaths entirely glabrous or with tufts of hair lateral to the ligule; blades 0.5–2 (3) mm wide, flat to loosely involute, scabrous and occasionally sparsely hairy with papilla-based hairs; ligule a ring of hairs to ca 1 mm long; panicle of (1) 2–9 erect to widely spreading, persistent, spike-like branches, these 0.5–3 cm long, the spikelets ultimately widely spreading, the axis straight or arcuate, scabrous, often puberulent at the base, terminating in a well-developed spikelet; spikelets 6–50 per branch, disarticulating above the glumes, mostly subterete, 2–5 mm long including the short awns, each with 1 or 2 rudimentary florets above the perfect one; glumes unequal, the first membranous, to ca 2 mm long, the second firm, rounded on the back, mostly broadly elliptical, 1.3–3 mm long, glabrous, typically notched and awn-tipped apically, pale or purple-tinged, surpassed by the fertile lemma or its awns; lemma of the lower floret rounded on the back, to ca 2.5 mm long, conspicuously hairy on the margins and often on the lower half of the midnerve, 3-lobed and 3-awned, the central lobe bifid, the awns 0.5–3 mm long, the anthers ca 0.5 mm long; first rudiment with the lemma 0.5–1 mm long, often cleft to the base along the nerves, the 3 nerves then free throughout and 0.5–3 mm long; second rudiment (when present) minute, fan- to club-shaped, awnless; $2n = 20, 40$. Dry to moist sites in desert shrub and creosote bush communities at 850 to 1830 m in Emery, Garfield, Grand, Kane, Millard, San Juan, Washington, and Wayne counties; California to Colorado, Texas, and Mexico; Argentina; 64 (0). Our plants are var. *barbata*, differing from the more southern variety in being consistently annual, without stolons, and with mostly geniculate culms rarely more than 3 dm tall (Gould 1979).

Bouteloua curtispindula (Michx.) Torr. Sideoats Grama. [*Chloris curtispindula* Michx.]. Perennial, often with slender to stout, scaly rhizomes; culms solitary to densely tufted, 0.2–1 m tall, simple or occasionally sparingly branched above the base, decumbent to stiffly erect, glabrous; leaves blue green; sheaths glabrous or sparsely long-hairy, the basal sheaths of previous years persistent; blades 2–7 mm wide, flat to loosely involute, scabrous, sometimes sparsely ciliate with coarse, papilla-based hairs near the ligule; ligule a ciliate membrane or a ring of hairs mostly less than 1 mm long; panicle often secund with 13–80 mostly pendulous, readily disarticulating, short-peduncled, spike-like branches, these typically elliptical to V-shaped, 0.6–2 cm long, the axis flattened, glabrous or scabrous to puberulent, prolonged beyond the point of origin of the terminal spikelet, the prolonged portion rarely surpassing the terminal spikelet; spikelets (1) 2–8 (13) per branch, subterete, closely appressed to the short axis, with or without a single rudi-

mentary floret above the perfect one; glumes unequal, the first small and membranous, the second firm, lanceolate, 3.8–7.5 mm long, sharply acute to awn-tipped, glabrous or scabrous, often purple-tinged, varying from shorter to longer than the body of the fertile lemma; lemma of the lower floret rounded on the back to somewhat keeled, 3.6–6 mm long, the lateral nerves often free toward the acute tip to form short awns, these subequal to the tip, the anthers red, orange, or yellow, ca 2 mm long; rudiment (when present) with 1–3 awns, the longest to ca 7 mm; $2n = 20, 28, 35, 40–66, 69–103$. Desert shrub, sagebrush, pinyon-juniper, and ponderosa pine communities, occasionally on open slopes, at 980 to 2440 m in Beaver, Duchesne, Garfield, Emery, Grand, Kane, San Juan, Washington, and Wayne counties; south-central Canada, most of the U. S., and in Mexico; South America; 77 (0). Gould (1975) cites as doubtful one record for *B. uniflora* from southern Utah. That taxon differs from *B. curtispindula* chiefly in having only one spikelet per branch of the inflorescence, a condition occasionally encountered within populations of *B. curtispindula*. Sideoats grama is a major source of forage over large areas of the U. S., but in Utah it is not sufficiently abundant to be of significance. The species is included in contemporary seed mixtures for use in reclamation projects, and at least the Duchesne County record is thought to represent such an origin.

Bouteloua eriopoda (Torr.) Torr. Black Grama. [*Chondrosium eriopodum* Torr.]. Tufted perennial from a hard, knotty, woolly base, sometimes becoming stoloniferous; culms 2–6 (7) dm tall, sprawling to ascending, densely white-woolly, especially on the lower internodes; sheaths glabrous or ciliate at the summit; blades 0.5–2.2 mm wide, flat to involute, smooth or scabrous, often ciliate with papilla-based hairs near the ligule; ligule a ring of hairs less than 1 mm long; panicle of 2–8 ascending to occasionally widely spreading, persistent, spike-like branches, these (1) 2–4 (5) cm long, the branch axis densely white-woolly at the base and usually hairy to some degree at the base of each spikelet, prolonged beyond the point of origin of the terminal spikelet as a needlelike tip; spikelets 8–20 per branch, disarticulating above the glumes, subterete, strongly ascending, 6–10 mm long excluding the awns, each with a single rudimentary floret above the perfect one; glumes very unequal, the first membranous, 2–4.5 mm long, the second firm, lance-elliptical, 6–10 mm long, long-tapered to a sharply acute tip, pale or purple-tinged, exceeding the body of the fertile lemma; lemma of the lower floret bearded on the callus, rounded to somewhat keeled on the back, 4.5–7 mm long, glabrous or sparsely hairy, tapered to a terminal awn 1.5–3 mm long, the lateral nerves often prolonged as awn tips, the anthers 1.5–3.5 mm long; rudiment bearded at the short, stalklike base, its 3 awns mostly 4–8 mm long; $2n = 20, 21, 28$. Sagebrush, desert shrub, and pinyon-juniper communities at 850 to 2440 m in Garfield, Grand, Kane, San Juan, Washington, and Wayne counties; California and Arizona, and from Wyoming south to northern Mexico, Kansas, Oklahoma and Texas; 39 (i). Black grama is a palatable and nutritious source of forage in summer and winter. It is also drought resistant and some strains have exceptional seedling vigor and good seed production (Thornburg 1982).

Bouteloua gracilis (H.B.K.) Lag. ex Steudel Blue Grama. [*Chondrosium gracile* H.B.K.]. Perennial, often

with short, stout rhizomes, sometimes mat-forming; culms tufted, 1–6 (7) dm tall, erect or decumbent to geniculate-sprawling, glabrous or the nodes minutely hairy; leaves chiefly basal; sheaths glabrous or sparsely long-hairy, sometimes with tufts of hair lateral to the ligule; blades 0.5–2.2 mm wide, flat to involute, often recurved, scaberulous to short-hairy; ligule a ring of hairs, sometimes membranous-based, the whole less than 1 mm long; panicle of 1–3 (4) persistent, ascending to spreading, spikelike branches, these 1–4.5 (5) cm long, pectinate, the axis generally arcuate, usually pubescent at the base and glabrous or scabrous above, terminating in one or more rudimentary spikelets; spikelets densely crowded (30–90 per branch), at maturity widely spreading, disarticulating above the glumes, subterete to strongly keeled, generally 4–6 mm long excluding the awns, each with 1 or 2 rudimentary florets above the perfect one; glumes unequal, the first membranous and small, the second firm, lanceolate, 3.5–6 (6.5) mm long, slightly shorter than the fertile lemma, long-tapered to a sharply acute tip, pale or purple-tinged, glabrous or the midnerve scabrous to pubescent with simple or papilla-based hairs; lemma of the lower floret rounded or keeled on the back, 3–6 (6.5) mm long, pubescent at least below and bearded on the callus, the midnerve prolonged between 2 slender lobes as an awn 1–3 mm long, the lateral nerves often prolonged as small bristles, the anthers mostly 2.5–3.5 mm long; first rudiment with a 3-lobed lemma surpassed by the long hairs at the summit of the rachilla and terminating in 3 awns 2.5–5 mm long, the second rudiment (when present) obovate, 1–2 mm long and awnless; $2n = 20, 21, 28, 35, 40, 42, 60-62, 77, 84$. Salt desert shrub, desert shrub, grass-sagebrush, pinyon-juniper, and ponderosa pine communities at 980 to 2960 m in Beaver, Carbon, Daggett, Duchesne, Emery, Garfield, Grand, Iron, Kane, Millard, Piute, San Juan, Sanpete, Sevier, Uintah, Utah, Wasatch, Washington, and Wayne counties; southwestern Canada, throughout the southwestern and central U. S. to Mexico, rare in the eastern U. S.; 210 (iii). Blue grama is highly palatable as forage, and is resistant to cold, drought, and grazing. It forms a dense sod, and is useful for erosion control in arid and semiarid regions. Although its productivity is relatively low in Utah, it does form dense stands in some areas of southern and eastern Utah. The grass is unusual in that plants remain dormant throughout the spring and summer, growing and producing flowering culms at a rapid rate following late summer rains.

Bouteloua hirsuta Lag. Hairy Grama. This species is similar to *B. gracilis*, differing as follows: culms densely tufted, not rhizomatous; sheaths and blades glabrous or more often long-hairy with papilla-based hairs; spikelike branches with the rachis prolonged beyond the terminal spikelet as a needlelike tip 5–20 mm long; second glume 3–5 mm long, distinctly shorter than the fertile lemma, the midnerve often ciliate with papilla-based hairs 1–2 mm long and prolonged as an awn tip; first rudiment with a glabrous rachilla; $2n = 12, 20-22, 24, 28, 36, 37, 40, 42, 46, 50$. Known in Utah by a single 1946 collection (Booth s.n. UTC) from an open dry, gravelly site in Zion National Park, Washington County, Wyoming south throughout the southwestern and central states into Mexico, east to Wisconsin, Illinois, and Louisiana, disjunct in Florida; 1 (0).

Bouteloua simplex Lag. Mat Grama. [*B. procumbens* (Durand) Griffiths]. Tufted annual; culms 0.5–2 (3.5) dm

tall, erect or geniculate below to prostrate; sheaths glabrous or long-hairy near the ligule; blades 0.5–1.5 mm wide, flat to involute, scaberulous or sparsely hairy, often ciliate above the ligule; ligule a ciliate membrane ca 0.2 mm long; inflorescence a persistent, solitary, spikelike branch 0.8–2.5 cm long, ultimately pectinate and arenate, the axis essentially glabrous or minutely hairy at the base, terminating in a rudimentary spikelet; spikelets crowded (10–80 per branch), at maturity widely spreading, disarticulating above the glumes, mostly flattened, 4–6 mm long including the short awns, each with 1 or 2 rudimentary florets above the perfect one; glumes unequal, keeled, the first 2–3 mm long, the second lanceolate, 3.5–5.5 mm long, sharply acute at the tip, usually pale, glabrous or the midnerve scaberulous, ultimately exceeded by the awn of the fertile lemma; lemma of the lower floret generally laterally compressed and keeled, 2.5–3.5 mm long, usually bearded on the callus and pubescent on the nerves, the latter prolonged as awns 1.5–2.5 mm long, the anthers to ca 0.5 mm long; first rudiment a minute membranous body with 3 awns to 4 mm long, the second rudiment (when present) an obovate scale; $2n = 20, 40$. In rocky or sandy-gravelly soils, roadsides and along waterways, in greasewood and sagebrush communities at 1520 to 2440 m in Beaver, Garfield, Iron, Piute, Sevier, and Washington counties; Wyoming and Colorado to Arizona, New Mexico, Texas, and Mexico; Argentina; 9 (0).

Bouteloua trifida Thurber in Wats. Red Grama. Tufted perennial from a somewhat hard, often short-rhizomatous base; culms 0.4–3 (4) dm tall, wiry, erect or occasionally geniculate below, glabrous or scabrid-puberulent; leaves chiefly basal; sheaths glabrous or scabrid-puberulent; blades 0.5–1.5 mm wide, usually involute, scaberulous to puberulent or sometimes with a few papilla-based hairs; ligule a ring of hairs less than 1 mm long; panicle of 1–7 persistent, erect-ascending, spikelike branches, these 0.7–2.5 (4) cm long, the axis mostly straight or only slightly arcuate, subglabrous to puberulent, terminating in a perfect spikelet; spikelets loosely spaced, 8–32 per branch, at maturity spreading-ascending, disarticulating above the glumes, subterete, mostly 3–5 mm long excluding the awns, each with a single rudimentary floret above the perfect one; glumes subequal to unequal, lanceolate, acute to slightly bifid and mucronate apically, often purple-tinged, glabrous, the first 1.5–4 mm long, about as wide as the second, the latter mostly (2) 3–5 mm long, typically exceeding the body of the perfect lemma; lemma of the lower floret 2–4 mm long, glabrous to short-bearded on the callus, rounded on the back, glabrous to sparsely pubescent, the 3 nerves prolonged to form subequal or unequal awns 1–7 mm long, the anthers ca 0.5 mm long; rudiment usually consisting of a short stalklike base terminating in 3 awns 3.5–6 mm long; $2n = 20, 28$. Our few specimens from cliffs and rocky hillsides at 920 to 1220 m in San Juan and Washington counties; California and Nevada to Texas and Mexico; 2 (0).

Bromus L.

Annuals or perennials; culms tufted, rarely rhizomatous; herbage glabrous or pubescent (mostly retrorsely so); sheaths closed at least half their length, in a few species bearing auricles at the summit; blades flat or occasionally loosely involute; ligule membranous, often

brownish, arose to lacerate, pubescent or glabrous; inflorescence a compact to open, erect to nodding, panicle or raceme, the branches 1-8 per node; spikelets compressed to terete, at least 12 mm long, 1- to many-flowered, the uppermost floret sometimes reduced and sterile, the rachilla disarticulating above the glumes and between the florets; glumes lanceolate, rounded on the back to strongly laterally compressed and keeled; usually shorter than the lowermost lemma, awnless or rarely awn-tipped, the first 1- to 7-nerved, the second 3- to 9-nerved; lemma lanceolate to lance-ovate or obovate with a small glabrous or laterally puberulent callus, the body rounded on the back to strongly laterally compressed and keeled, 3- to 13-nerved, narrowly to broadly membranous-margined, awnless or more often with a straight to divergent, mostly subterminal awn, often arising between the 2 lobes or teeth of a bifid apex; palea shorter or barely longer than the lemma; stamens (2) 3, the anthers minute in cleistogamous florets, larger in chasmogamous ones; caryopsis usually adherent to the lemma and palea (one or both sometimes falling away at maturity), linear-oblong to elliptical, bearing at the summit a persistent tuft of short hairs, the embryo 1/8-1/3 the length of the grain; $x = 7$. Tsvetev (1984) and Weber (1976) elevate to the rank of genus three of the subgeneric sections of *Bromus* as recognized by Hitchcock (1951): *Ceratochloa* comprised of those species with strongly compressed-keeled glumes and lemmas, *Bromopsis* of perennial species, and *Bromus* of annual ones. I have followed the more conservative approach of other contemporary North American workers and of Tutin et al. (1980). Most perennial bromes provide good forage, but the fruiting awns of some annuals are capable of causing mechanical injury to eyes and mouths of grazing animals.

Elliott, F. C. 1949. *Bromus inermis* and *B. pumpellianus* in North America Evolution 3: 142-149.
 Wagon, H. K. 1952. A revision of the genus *Bromus*, section *Bromopsis*, of North America. Brittonia 7: 415-480.

Note: In the following key, spikelet length excludes awns; lemma length includes apical teeth (when present) but excludes awns; and awns are measured from the point at which they arise on the lemma.

- 1. Lemmas with awns averaging at least 10 mm long; plants annual 2
- Lemmas awnless or with awns averaging less than 10 mm long (rarely to 12 mm in the perennial *B. vulgaris*); plants annual or perennial 7
- 2(1). Awns of the lemmas mostly 30-60 mm long; first glume 13-25 mm long *B. diandrus*
- Awns of the lemmas averaging less than 30 mm long; first glume averaging less than 13 mm long 3
- 3(2). First glume 3- to 5-nerved; lemmas averaging more than 1.5 mm wide midnerve to margin *B. japonicus*
- First glume 1-nerved; lemmas averaging not more than 1.5 mm wide midnerve to margin 4
- 4(3). Awns geniculate and twisted near the base; lemma with apical teeth often bristlelike; second glume typically equal to or exceeding the lowermost lemma; plant reported only from Washington County .. *B. trinitii*
- Awns straight or nearly so, not twisted below; lemma with apical teeth membranous; second glume often shorter than the lowermost lemma; plants more general in distribution 5

- 5(4). Panicles dense, erect, mostly wedge-shaped in outline, 0.3-1 dm long including the awns, the branches mostly very short and erect-ascending; apical teeth of the lemma mostly 2.5-5 mm long *B. rubens*
- Panicles loose, often either nodding or more than 1 dm long, the branches often elongate, flexuous, and widely spreading; apical teeth of the lemma to 3 mm long 6
- 6(5). Lemmas 9-13 (14) mm long, the awns 7-20 mm long; primary panicle branches typically bearing more than 3 spikelets (except in very young plants) ... *B. tectorum*
- Lemmas averaging more than 13 (13-20) mm long, the awns 15-30 mm long; primary panicle branches bearing 1 or 2 (3) spikelets *B. sterilis*
- 7(1). Spikelets strongly compressed, the glumes and lemmas sharply keeled (except at fruiting); lemmas long-tapered to an acute tip; first glume (3) 5- to 9-nerved 8
- Spikelets terete to moderately flattened, the glumes and lemmas not regularly sharply keeled; lemmas often obtuse to rounded apically; first glume 1- to 5-nerved 9
- 8(7). Lemmas awnless or with awns averaging no more than 3 (0.5-3) mm long; first glume 5- to 9-nerved; plants rare, weedy *B. catharticus*
- Lemmas with awns averaging more than 3 (2-8) mm long; first glume 3 (5) -nerved; plants widespread, occupying chiefly native habitats *B. carinatus*
- 9(7). Plants annual (occasionally biennial); second glume 5- to 7-nerved 10
- Plants perennial; second glume 3-nerved (occasionally 5-nerved in the rhizomatous *B. inermis*) 13
- 10(9). Palea equal to or exceeding the lemma, the palea tip visible at the apex of at least some of the lemmas; lemmas at maturity usually shiny-indurate with the margins incurved around the grain *B. secalinus*
- Palea shorter than the lemma; lemmas at maturity neither shiny-indurate nor with margins inrolled ... 11
- 11(10). Lemmas awnless or with an awn tip less than 2 mm long, at maturity 3-4.5 mm wide midnerve to margin *B. briziformis*
- Lemmas regularly awned, rarely as much as 3 mm wide midnerve to margin 12
- 12(11). Pedicels mostly shorter than the spikelets, the panicles compact, erect; lemmas hairy or less often glabrous, at maturity the area between the nerves often concave *B. hordeaceus*
- Pedicels mostly longer than the spikelets; panicles loose, erect or nodding; lemmas glabrous or merely scabrous, the area between the nerves flat *B. japonicus*
- 13(9). Lemmas glabrous or obscurely puberulent; awns lacking or 1-3 (4) mm long; panicle branches mostly erect or ascending; plants rhizomatous *B. inermis*
- Lemmas distinctly hairy, the awns 1-10 (12) mm long; panicle branches drooping; plants without rhizomes 14
- 14(13). Awns averaging no more than 3 (1-4) mm long; glumes often pubescent, the first mostly 3-nerved; leaf blades 1-5 (6) mm wide *B. anomalus*
- Awns averaging more than 3 (2-12) mm long; glumes glabrous or pubescent, the first 1-nerved (sometimes 3-nerved, usually only at the base); leaf blades often more than 6 (3-15) mm wide 15

- 15(14). Awns averaging less than 6 (2–6) mm long; second glume glabrous or scabrous, not distinctly hairy; culm nodes typically glabrous; ligule to 2 mm long *B. ciliatus*
 — Awns averaging at least 6 (5–12) mm long; second glume often hairy near the margins; culm nodes typically pubescent; ligule 2–5 mm long *B. vulgaris*

***Bromus anomalus* Rupr. ex Fourn.** Nodding Brome. [*Bromopsis anomala* (Rupr.) Holub; *B. porteri* (Coul.) Nash; *Bromus frondosus* (Shear) Woot. & Standl.; *B. porteri* Nash]. Perennial; culms solitary or in small tufts, 3–10 (12) dm tall, typically puberulent, at least near the nodes; sheaths glabrous or hairy, without auricles; blades 1–5 (6) mm wide, flat to loosely involute, scabrous and occasionally long-hairy; ligule 0.2–1 (2) mm long; panicle 0.5–1.8 dm long, open, nodding; spikelets typically 1 or 2 per primary branch, 13–35 mm long, subterete to moderately compressed, (5) 7– to 11-flowered; glumes often pubescent, the first elliptical or less often lanceolate, 5–8.5 mm long, typically widest at about midlength, obtuse to acute apically, (1) 3-nerved (usually some 1-nerved within any one panicle), the second similar to the first in shape, 6–11 mm long, 3-nerved; lemma narrowly elliptical, slightly compressed to rounded on the back, (8) 9–13 mm long and 1–2 mm wide midnerve to margin, 5– to 7-nerved, conspicuously hairy throughout, sometimes more densely so along the margins, acutish to rounded and occasionally shallowly notched at the apex, the awn (1) 1.5–3 (4) mm long; anthers 2–3 (3.7) mm long; $2n = 14$, 28. Sagebrush, mountain brush, pinyon-juniper, ponderosa pine, aspen, and spruce-fir communities, on open slopes and in meadows at higher elevations, at 1680 to 3350 m in Beaver, Box Elder, Cache, Carbon, Daggett, Duchesne, Emery, Garfield, Grand, Iron, Kane, Millard, Piute, Rich, Salt Lake, San Juan, Sanpete, Sevier, Summit, Uintah, Utah, Wasatch, Washington, and Wayne counties; British Columbia to Saskatchewan, south throughout most of the western U. S. and in Mexico, east to the Dakotas and Texas; 157 (iv). Segregation of *B. frondosus* from *B. anomalus* has been based on glabrous sheaths and panicles more than 1 dm long, characters not necessarily correlated in our material. According to Gould (1951), *B. frondosus* is probably only a robust form of *B. anomalus*. See comments under *B. ciliatus* concerning the close relationship of that species to *B. anomalus*. Nodding brome provides palatable forage and its presence in abundance is evidence of good range condition.

***Bromus briziformis* Fisch. & Mey. in Fisch., Mey., & Trautv.** Rattlesnake Chess. Annual; culms 1–6 (8.5) dm tall, solitary or in small tufts; sheaths densely soft-hairy, without auricles; blades ascending to lax, 1–6 (8) mm wide, flat or occasionally somewhat involute, scabrous to more often pubescent; ligule 0.5–3 mm long; panicle 0.4–1.7 (2) dm long, nodding; spikelets 1–3 per primary branch, moderately compressed, elliptical to oblong, 12–32 mm long and 7–15 mm wide, 7– to 15-flowered; glumes broad, rounded to U-shaped on the backs, obscurely multinerved, the first 4–6 mm long, the second 5–9 mm long, shorter than the lowermost lemma; lemma broadly diamond-shaped, angled on the margins, at maturity more or less inflated, 6.5–10 mm long and (2.8) 3–4.5 mm wide midnerve to margin, obscurely multinerved, glabrous, abruptly acute to obtuse and entire to emarginate apically, awnless or with an awn tip to ca 1 mm

long; palea shorter than the lemma; anthers to ca 0.8 mm long; $2n = 14$. Salt desert shrub, sagebrush, mountain brush, and juniper communities, and on open slopes, at 1280 to 1955 m in Box Elder, Cache, Daggett, Davis, Millard, Salt Lake, Sevier, Summit, Tooele, Uintah, and Utah counties; native to Eurasia, introduced in Alaska, British Columbia, Ontario, most of the western U. S., Mexico, the Great Plains, and the Northeast; 65 (v). The spelling "*brizaeformis*" is corrected to *briziformis* in accordance with the International Code of Botanical Nomenclature (Rhodora 69: 451–455. 1967). A population of *B. briziformis* adjacent to one of *B. japonicus*, included a few plants with the broad spikelets of the former and lemmas awned as in the latter (Arnov 2895 UT).

***Bromus carinatus* H. & A.** Mountain or California Brome. [*B. breviaristatus* Buckley; *B. marginatus* Nees ex Steudel; *B. polyanthus* Scribn. ex Shear; *Ceratochloa carinata* (H. & A.) Tutin]. Perennial, often flowering the first season; culms solitary or tufted, usually erect, (2) 6–18 dm tall, glabrous or minutely hairy; sheaths glabrous or short- to long-hairy, evidently lacking auricles in our material; blades lax, 2–12 (15) mm wide, flat or rarely folded to involute, glabrous or more often scabrous to variously pubescent; ligule 1–4 mm long; panicle narrowly elongate to broadly pyramidal, compact to open, (0.5) 1–3 dm long, the branches mostly 3–15 cm long, erect or somewhat divergent at flowering, at fruiting often drooping under the weight of the spikelets; spikelets usually 1–4 per primary branch, strongly compressed, 15–50 (60) mm long, 4– to 16-flowered; glumes lanceolate, strongly keeled, sharply acute at the apex, glabrous or scabrous to short-hairy, the first 6.5–11 mm long, 3 (5) -nerved, the second 9–13 mm long, 5– to 7 (8) -nerved; lemma lanceolate, sharply keeled (becoming less so as the caryopsis matures), (10) 13–17 mm long and 2–3 mm wide midnerve to margin, long-tapered to a sharply acute, entire or minutely notched apex, more or less prominently 7– to 9-nerved, glabrous or scabrous to densely pubescent throughout, the awn essentially terminal, (2) 3–7 (8) mm long; anthers (1.5) 2–8 (9) mm long or 0.4–1 mm long in cleistogamous florets; $2n = 28$, 42, 56, 70. Sagebrush, mountain brush, aspen, spruce-fir, and subalpine meadow communities, at (920) 1830 to 3200 m in all Utah counties except Daggett and Wayne; Alaska to Alberta and Ontario, the western U. S., Texas, and Mexico; naturalized in Europe; 277 (ix). The facultatively cleistogamous *B. carinatus* is part of a highly successful polymorphic complex consisting of a number of closely related, possibly conspecific taxa widespread in western North America and in parts of Central and South America. Mountain brome is a palatable, short-lived bunchgrass valuable for grazing and erosion control in areas with a mean annual precipitation of 46 cm or more (Thornburg 1982). It is better adapted for broadcast seeding than most grasses but is somewhat less nutritious than many other mountain grasses at comparable stages of growth (Vallentine 1961).

***Bromus catharticus* Vahl** Rescue Grass. [*Festuca uniolooides* Willd.; *B. uniolooides* (Willd.) H.B.K.; *B. willdenowii* Kunth; *Ceratochloa uniolooides* (Willd.) Beauv.]. Annual to short-lived perennial; culms solitary to densely tufted, erect to somewhat decumbent, (1) 3–12 dm tall; sheaths glabrous or pubescent, without auricles; blades flat, 2–10 mm wide, glabrous or scabrous to variously pubescent; ligule 2–5 mm long; panicle narrowly

elongate to broadly pyramidal, compact to open, 0.5–3 dm long, erect or ultimately nodding; spikelets mostly 1–6 per primary branch, strongly compressed, 10–45 mm long, 4- to 14-flowered; glumes lanceolate, strongly keeled, sharply acute at the apex, the first 6–12 mm long, 5- to 7 (9)-nerved, the second 7–13 mm long, 7- to 9-nerved; lemma lanceolate, sharply keeled, 9–15 (20) mm long and 1.5–2.5 mm wide midnerve to margin, long-tapered to a sharply acute, rarely emarginate apex, usually prominently 7- to 13-nerved, glabrous or scabrous to pubescent, awnless or awn-tipped, rarely with an awn to 3 mm long; palea shorter than the lemma; anthers 2–4 mm long, much shorter in cleistogamous florets; $2n = 42$. Along waterways, in waste places, fallow fields, and as a weed of cultivated sites, at 850 to 1890 m in Carbon, Garfield, Iron, Kane, Piute, Utah, Washington, and Wayne counties; native to South America, cultivated in the southern U. S. for forage, escaping and adventive northward; naturalized in Europe; 23 (0). This plant was referred to *B. unioides* when the original name, *B. catharticus*, was rejected as a *nomen confusum*. Recently, Pinto-Escobar restored *B. catharticus* as the valid name (Caldasia 11: 9–16. 1976). Raven (Brittonia 12: 219–221. 1960) differentiated between *B. unioides* and *B. willdenowii*, but subsequent workers including Pinto-Escobar (Bot. Jahrb. Syst. 102: 445–457. 1981) have found no basis for recognizing more than one species. Rescue grass is a plant of subtropical regions, which “rescues” livestock with its lush winter growth.

Bromus ciliatus L. Fringed Brome. [*Bromopsis ciliata* (L.) Holub; *Bromus richardsonii* Link]. Perennial; culms in mostly small loose tufts, 5–12 dm tall, usually glabrous; sheaths without auricles, glabrous or hairy, the lowermost sometimes densely pubescent, the upper more sparsely so, the margins often ciliate near the ligule; blades lax, 3–15 mm wide, scabrous or sparsely long-hairy; ligule 0.3–2 mm long; panicle narrowly elongate, 0.7–2.5 dm long, nodding; spikelets typically 1–4 per primary branch, terete to moderately compressed, 15–30 mm long, 5- to 9-flowered; glumes glabrous or scabrous to occasionally scabrid-puberulent on the nerves, the first 5–10 mm long, tapered from below midlength to an acute apex, 1- or basally 3-nerved, the second lanceolate to broadly elliptical, 6–12 mm long, 3-nerved; lemma narrowly elliptical, rounded on the back, 8–15 mm long and 1–2 mm wide from midnerve to margin, 5- to 7-nerved, conspicuously hairy along the margins or sometimes throughout, entire or shallowly bifid apically, the awn (2) 3–6 mm long, mostly straight; anthers 1–3 (4) mm long; $2n = 14, 28, 56$. Aspen and spruce-fir communities and occasionally under ponderosa pine and lodgepole pine, in meadows, and on open slopes, at 1520 to 3510 m in Beaver, Box Elder, Cache, Carbon, Daggett, Duchesne, Emery, Garfield, Grand, Iron, Juab, Kane, Piute, Salt Lake, San Juan, Sanpete, Sevier, Summit, Tooele, Uintah, Utah, Wasatch, and Washington counties; Alaska, across southern Canada, south throughout the western U. S., and in much of the remainder of the U. S.; Mexico; 181 (x). Although *B. ciliatus* and *B. anomalus* are closely related and occupy the same type of habitats, they appear in Utah, at least, to be maintaining their integrity as distinct species. Only about 3 percent of all specimens examined (e.g., Arnow 6009 UT) display evidence of intermediacy. Baum (Canad. J. Bot. 45: 1845–1852.

1967) retypified Kalm’s specimens, assigning the name *B. ciliatus* to *B. latiglumis* (Shear) A. S. Hitchc. of the north-eastern U. S. and referring what we have called *B. ciliatus* to *B. canadensis* Michx. Considerable confusion surrounds the definition and distribution of these and several other closely related taxa, however, and I have followed other contemporary workers (e.g., Cronquist et al. 1977) in retaining the more familiar names. Fringed brome is highly palatable to all classes of livestock and to deer and elk. Although it does not form dense stands, the species is sufficiently common to constitute a moderately good source of forage on some forest ranges.

Bromus diandrus Roth Ripgut Brome. [*B. rigidus* Roth]. Annual; culms 1–9 (10) dm tall, solitary to loosely tufted, usually erect; sheaths without auricles, more or less densely pubescent with moderately long, spreading hairs; blades (1) 2–8 mm wide, flat or involute, scabrous and typically hairy; ligule (1) 2–6 mm long; panicle compact to open, to 2.5 dm long, the branches erect or spreading to drooping; spikelets usually 1 or 2 per primary branch, compressed, 30–50 mm long, (4) 5- to 8-flowered; glumes narrow, glabrous or scabrous on the keel, tapered to sharply acute tips, the first 13–25 mm long, mostly 1-nerved, the second 20–32 mm long, mostly 3-nerved; lemma narrowly lanceolate, 20–36 mm long and 1–1.5 mm wide midnerve to margin, rounded on the back, 5- to 7-nerved, typically scabrous, bidentate apically, the teeth 4–7 mm long, the awn mostly 30–60 mm long; palea shorter than the lemma; anthers 0.8–1.5 mm long; $2n = 28, 42, 56, 70$. Creosote bush, pinyon-juniper, and mountain brush communities, mostly in the wake of disturbance, at 975 to 1985 m in Davis, Millard, Salt Lake, Washington, and Weber counties; native to Eurasia, adventive to established from British Columbia south through much of the western U. S. to Mexico, rare in the East; South America; 37 (iv). The binomial *B. rigidus* was applied by Roth in 1790 to a plant differing only slightly from the one he named *B. diandrus* in 1787. Gould and Shaw (1983) refer North American material to *B. diandrus*, and Tsvelev (1984) likewise reduces *B. rigidus* to synonymy.

Bromus hordeaceus L. Soft Chess. [*B. mollis* L.; *B. racemosus* L.]. Annual or biennial; culms solitary or in small tufts, 1–9 (10) dm tall, erect or ascending, occasionally geniculate at the lower nodes; sheaths densely soft-hairy, without auricles; blades 0.5–5 (7) mm wide, flat or occasionally involute, hairy or less often glabrous; ligule 0.2–2 mm long; panicle to 1 (1.3) dm long, erect, compact, the pedicels averaging shorter than the spikelets; spikelets moderately compressed, (8) 10–22 mm long, 5- to 12-flowered; glumes pubescent or glabrous, the first lanceolate to elliptical, 5–8 mm long, 3- to 5-nerved, the second elliptical, 6–9 mm long, 5- to 7-nerved; lemma ovate to obovate or diamond-shaped and then angled on the margins, rounded on the back to slightly compressed, 6–9 (10) mm long and 1.5–2.6 (3) mm wide midnerve to margin, prominently 7- to 9-nerved, the area between the nerves often concave, glabrous or pubescent, the awn arising 0.3–1 (1.5) mm below the entire to bifid tip, the awns of the upper lemmas 4–9 (10) mm long, straight to occasionally divergent and basally twisted; palea shorter than the lemma; anthers 0.5–2 mm long; $2n = 14, 28$. Salt desert shrub and sagebrush communities, occasionally on open or wooded slopes, at 1280 to 2530 m in Box Elder, Cache, Davis, Garfield, Juab, Millard, Salt Lake, Sum-

mit, Utah, and Weber counties; native to Eurasia, now essentially circumboreal, south through much of the U. S. and in Mexico; South America; 46 (xii). Linnaeus applied the name *B. hordeaceus* to a depauperate grass later shown to be conspecific with *B. mollis*. In consequence, most contemporary European authors (e.g., Tutin et al. 1980) have adopted the earlier epithet as the correct name for the species. *Bromus hordeaceus* occasionally intergrades with *B. japonicus* (q.v.).

Bromus inermis Leysser Smooth or Hungarian Brome. [*B. pumpellianus* Scribn.; *Bromopsis inermis* (Leysser) Holub]. Rhizomatous perennial; culms (1) 2–15 dm tall, solitary or in loose tufts, glabrous or hairy; sheaths glabrous or scabrous to long-hairy, with auricles (when present) to ca 1 mm long; blades 2–15 (19) mm wide, flat, scabrous to variously hairy; ligule 0.5–2 (2.5) mm long; panicle mostly oblong and erect, 0.5–2 (3) dm long, narrow and compact to broad and open, the branches appressed to ascending, usually widely spreading at flowering, sometimes the lower ones drooping in age; spikelets 1–5 per primary branch, terete to somewhat compressed, (12) 15–40 mm long, 5– to 13-flowered; glumes lanceolate to elliptical, rounded on the backs to moderately keeled, sharply acute to rounded apically, the first (4) 5–8 mm long, 1– or occasionally faintly 3-nerved, the second (5) 6–10 mm long, 3– to 5-nerved; lemma elliptical, rounded on the back, (7) 9–13 (14) mm long and to 1.6 mm wide midnerve to margin, acute or obtuse to rounded at the entire to emarginate apex, more or less prominently 3-nerved, often with additional fainter nerves, glabrous or obscurely puberulent only near the base to nearly throughout, awnless or with awns 1–3 (4) mm long; anthers 2.5–6 mm long; $2n = 28, 42, 49, 54–58, 70$. Along roads and waterways, in fallow fields and other waste places, and in openings in mountain brush, pinyon-juniper, aspen, spruce-fir, ponderosa pine, lodgepole pine, and meadow communities, at 1280 to 3235 m in all Utah counties except Grand; native to Eurasia, introduced to North America in 1884 (Elliott 1949), now circumboreal, south throughout the U. S. except in the Southeast; 186 (x). Elliott (1949) suggested that due to extensive introgression between the introduced *B. inermis* and the native *B. pumpellianus*, the latter might well be reduced to a subspecies of *B. inermis*, distinguished from the typical element of the species by its pubescent versus glabrous culm nodes and lemmas. Elliott cited a single locality for *B. pumpellianus* in Utah, whereas Wagon (1952) described ssp. *pumpellianus* as occurring entirely to the east of the State. In any case, I have seen no material that could be identified as belonging to the native strain. Smooth brome, of major economic importance as a sod-forming grass, is used for pasture, hay, silage, and erosion control throughout much of the U. S. In the West it is extensively used in seeding rangeland and roadsides below 2800 m in areas with mean annual precipitation of 38 cm or more (Thornburg 1982). The closely related *B. biebersteini* R. & S., native to Asia, is included in some contemporary seed mixes that have been used in range seedings in our area. This species differs from *B. inermis* in having racemelike panicles, consistently auricled sheaths, and short-awned lemmas.

Bromus japonicus Thunb. ex Murray Japanese or Meadow Chess. [*B. commutatus* Schrader]. Annual; culms solitary or in small tufts, 2–8 (12) dm tall, erect or ascending, often geniculate at the lowermost nodes;

sheaths soft-hairy, without auricles; blades ascending to lax, 1–7 (8) mm wide, flat or involute, usually soft-hairy and sometimes scabrous; ligule 0.5–1.5 mm long; panicle to ca 2 dm long, erect to ultimately nodding, the lowermost branches 1–15 cm long; spikelets usually 1 or 2 per primary branch, but the lower branches occasionally bearing as many as 8, moderately compressed at maturity, 12–30 (40) mm long, 5– to 18-flowered; glumes glabrous or scabrous, acute to obtuse at the apex, the first lanceolate, (3.5) 4–6 (7) mm long, 3– to 5-nerved, the second mostly elliptical, 5–8.5 mm long, 5– to 7 (9) -nerved; lemma more or less diamond-shaped to broadly elliptical, rounded on the back to laterally compressed but not sharply keeled, (6.5) 7–12 mm long and 1.5–3 mm wide midnerve to margin, more or less prominently 7– to 9-nerved, glabrous throughout or scaberulous above, the awn arising 0.5–3 mm below the entire to bifid apex of the lemma, those of the lowermost lemmas often poorly developed, those of the upper ones mostly 8–15 mm long, straight or at maturity divergent and often twisted at the base (hygroscopic); palea distinctly shorter than the lemma; anthers 0.5–1.7 mm long; $2n = 14, 28, 56$. In mostly disturbed sites in greasewood, sagebrush, mountain brush, and juniper communities, in meadows and on open slopes, at 760 to 2440 m in Box Elder, Cache, Carbon, Davis, Duchesne, Emery, Garfield, Grand, Iron, Juab, Kane, Millard, Morgan, Rich, Salt Lake, San Juan, Sanpete, Sevier, Summit, Tooele, Utah, Wasatch, Washington, and Weber counties; first collected in Utah in 1909 (*Muhlenbergia* 6: 63. 1910); native to Eurasia, now circumboreal, south throughout the U. S. and in Mexico; South America; 167 (xxix). As described in most contemporary floras, *B. japonicus* and *B. commutatus* represent extremes in what can be seen in nature as a continuous range of variation. The condition of panicle branches (relatively long, flexuous, and widely spreading in *B. japonicus* versus shorter and stiffly ascending in *B. commutatus*) is frequently cited as diagnostic. Both conditions are usually found within a single population, the length of panicle branches evidently related either to microhabitat or to maturity. That the illustration accompanying Thunberg's original description of *B. japonicus* depicts the panicle as having relatively short, strongly ascending branches also tends to eliminate this character as a criterion for recognizing two species. Numerous additional features, have been employed as diagnostic characters, but none is consistently correlated with the nature of the panicle or with any other character. The variety of characters employed by different authors as diagnostic in their attempt to comply with the concept that two species exist, is itself indicative of the absence of any real distinction. The taxa have the same chromosome number ($2n = 14$), occupy identical habitats, and have essentially the same geographic range. Gould (1951) and Voss (1972) note the lack of any clear distinction between them. *Bromus japonicus* hybridizes with both *B. briziformis* (Arnou 2895 & 4835 UT) and *B. hordeaceus* (Harrison 8370 BRY, Arnou 3964, 5919 UT).

Bromus rubens L. Red Brome; Foxtail Brome. Annual; culms 1–6 (8) dm tall, erect, solitary or in small tufts; sheaths without auricles, pubescent with short soft hairs or glabrous in part; blades 1–5 mm wide, flat to loosely involute, puberulent to pubescent; ligule 1–4 mm long; panicle 0.3–1 dm long (including awns), erect, often turning reddish purple, typically obovoid to wedge-shaped in

outline, dense, the short branches only occasionally visible, mostly erect to slightly spreading; spikelets subterete to somewhat compressed, 18–30 mm long, 3- to 8-flowered; glumes narrowly lanceolate, tapered to finely acute tips, scabrous to hairy or occasionally glabrous, the first 5–10 mm long, 1-nerved, the second 8–13 mm long, 3-nerved; lemma lanceolate, 12–17 mm long and 1–1.3 mm wide midnerve to margin, more or less keeled to rounded on the back, 3- to 5-nerved, scaberulous (at least above) to distinctly hairy, bidentate at the sharply acute apex, the teeth membranous, mostly 2.5–5 mm long, the awn 10–24 mm long, straight to slightly divergent; anthers 0.4–0.9 mm long; $2n = 28$. Blackbrush, creosote bush, and other mixed desert shrub communities at 700 to 1710 m in Beaver, Box Elder, Garfield, Juab, Kane, Millard, San Juan, Tooele, and Washington counties; first reported in Utah in 1935; native to Eurasia, now introduced from British Columbia south throughout most of the western U. S. and in Mexico; 89 (0).

Bromus secalinus L. Rye Chess or Cheat. Annual or biennial; culms solitary or in small tufts, 2–12 dm tall, erect; sheaths without auricles, glabrous or sparsely pubescent with long soft hairs; blades lax to ascending, 1–7 (10) mm wide, flat or involute, short- to long-hairy and usually scabrous; ligule 0.5–4 mm long; panicle to 2 dm long, erect to ultimately nodding, compact or open, the branches erect-appressed to spreading, the pedicels shorter to longer than the spikelets; spikelets mostly 1 or 2 (3) per primary branch, subterete to moderately compressed, 12–40 mm long, 4- to 12-flowered, slow to disarticulate; glumes mostly elliptical, abruptly acute to rounded at the apex, glabrous, rarely short-awned, the first 4–6 mm long, 3 (5)-nerved, the second 5–9 mm long, 5- to 7-nerved; lemma broadly elliptical to diamond-shaped, rounded on the back, 6–9 mm long and 1.8–2.3 mm wide midnerve to margin, 5- to 7-nerved, becoming hardened except for the membranous, ultimately inrolled margin, at maturity usually smooth and shiny, rarely hairy, the awn arising 1–2 mm below the obtuse, entire to barely notched apex, the awns of the upper lemmas 0.5–8 (9) mm long, straight or flexuous, erect or divergent, occasionally lacking; palea equal to or more often slightly longer than the lemma; anthers 0.8–2 mm long; $2n = 14$, 28. Disturbed sites below 1525 m in Cache and Salt Lake counties; native to Eurasia, introduced from Alaska to Alberta, sporadically elsewhere in Canada, and through most of the U. S.; South America; 6 (0). Owing to improved methods of freeing cereal grains from impurities, this farmland weed has become uncommon or rare; since 1909 it has been collected in Utah only once (in 1979).

Bromus sterilis L. Poverty Brome. Annual; culms 2–10 dm tall, solitary or in small tufts, erect or occasionally geniculate at the lower nodes; sheaths without auricles, more or less uniformly puberulent, at least below, occasionally the hairs long and spreading; blades 2–5 (8) mm wide, flat to loosely involute, obscurely to conspicuously hairy; ligule 1.5–4 mm long; panicle 1–2 (2.4) dm long, open, the branches ascending to drooping, with spikelets usually 1 or 2 (3) per primary branch, these subterete to somewhat compressed, (15) 20–30 (36) mm long, 4- to 9-flowered; glumes narrowly lanceolate, glabrous, tapered to awnlike tips, the first 7–12 (14) mm long, 1-nerved, the second 9–17 (20) mm long, 3-nerved; lemma narrowly lanceolate, 13–20 mm long and 0.8–1.3

mm wide midnerve to margin, 5- to 7-nerved, glabrous or more often scaberulous to scabrid-puberulent, bidentate at the sharply acute tips, the teeth membranous, very slender, mostly 0.5–2 (3) mm long, the awn 15–30 mm long; palea shorter than the lemma; anthers 0.8–1.2 (1.6) mm long; $2n = 14$, 28. Usually in disturbed sites below 1830 m in Davis, Salt Lake, Utah, and Washington counties; native to Eurasia, sparingly introduced in Canada and in the western U. S., adventive in Texas, widespread in the East; 26 (xi).

Bromus tectorum L. Cheatgrass; Downy Chess. Annual or winter annual; culms 0.5–8 (11) dm tall, solitary to tufted, usually erect; sheaths without auricles, more or less densely soft-hairy, often with some longer spreading hairs; blades 0.5–6 (8) mm wide, flat to loosely involute, usually densely soft-hairy and sometimes scaberulous, often with longer spreading hairs, especially along the margins near the ligules; ligule 1–3 (4) mm long; panicle to 1.5 (2) dm long, loose to open and ultimately nodding, the branches often flexuous; spikelets 1–8 or more per primary branch, subterete to somewhat compressed, 10–24 mm long, 3- to 7-flowered, green or purple-tinged to purple; glumes narrowly lanceolate, tapered to sharply acute tips, pubescent or occasionally glabrous, the first (4) 5–8 (9) mm long, 1-nerved, the second 8–11 (13) mm long, 3-nerved; lemma narrowly lanceolate, 9–13 mm long and 1–1.5 mm wide midnerve to margin, more or less obscurely 5- to 7-nerved, variously pubescent or occasionally glabrous, bidentate at the apex, the teeth membranous, 1–3 mm long, the awn (7) 10–18 (20) mm long; anthers 0.5–0.9 mm long; $2n = 14$. Open slopes, salt desert shrub, sagebrush, pinyon-juniper, and less commonly aspen and conifer communities, at 850 to 2590 m in all Utah counties; native to Eurasia, now circum-boreal, south throughout the U. S.; South America; 212 (iv). Cheatgrass, first collected in Utah by Marcus E. Jones in 1894, is now an integral part of our flora, turning whole hillsides red brown as it matures. Often regarded as a noxious weed, the grass has been shown to have considerable economic importance as forage and to provide fair protection to soil and watersheds (Ecology 30: 58–74, 1949). These advantages are offset, however, by the fire-hazard potential and the threat of injury to animals ingesting the harsh awns and sharp-tipped lemmas of fruiting plants. Moreover, in drought situations the presence of *B. tectorum* causes rapid depletion of soil moisture that may retard or prevent the establishment of perennial grasses.

Bromus trinii Desv. in Gay Chilean Chess. Annual; culms 2–7 (10) dm tall, erect, solitary or in small tufts; sheaths sparsely to densely pubescent with long spreading hairs, occasionally with auricles to 0.8 mm long; blades 2–10 mm wide, flat, scabrous to variously hairy; ligule 1–4 mm long; panicle narrowly elongate, 0.8–2 dm long, loosely erect, the branches mostly strongly ascending to somewhat spreading; spikelets 1–4 or more per primary branch, compressed, 14–25 mm long, 5- to 9-flowered; glumes narrowly lanceolate, tapered to sharply acute, often awnlike tips, glabrous or scabrous, the first 7.5–12 mm long, 1-nerved, the second 8–15 mm long, typically equal to or exceeding the lowermost floret, 3-nerved; lemma narrowly lanceolate, 9–16 mm long and 1–1.3 mm wide midnerve to margin, 5-nerved, densely short-hairy, bidentate apically, the teeth often bristlelike, 2–5 mm long, the awn 10–24 mm long,

twisted near the base and geniculate; palea often exceeding the lemma; anthers 1.5–2.5 mm long; $2n = 42$. Rock crevices at 940 to 1220 m in Washington County; California, Nevada, Arizona, Colorado and Mexico; Chile and Argentina; 9 (0). This species is sometimes regarded as introduced in North America (Gould & Moran 1981).

***Bromus vulgaris* (Hook.) Shear** Columbia Brome. [*B. purgans* var. *vulgaris* Hook.; *Bromopsis vulgaris* (Hook.) Holub]. Perennial; culms loosely tufted, (6) 8–12 dm tall, nodes typically pubescent; sheaths without auricles, glabrous or more or less sparsely pubescent with long straight hairs, the margins often ciliate near the ligule; blades lax, 4–12 mm wide, flat, glabrous or scaberulous to occasionally hairy; ligule 2–5 mm long, often brownish; panicle narrowly elongate, 1–2 dm long, nodding; spikelets mostly 1–3 per primary branch, subterete to somewhat compressed, 12–30 mm long, 3– to 7 (10)–flowered; glumes narrowly lanceolate, sharply acute at the tips, often hairy near the margins, the first 5–9 mm long, 1-nerved, the second 8–11 mm long, 3-nerved; lemma narrowly elliptical to lanceolate, 8–14 mm long and 1–1.5 mm wide midnerve to margin, rounded on the back, 5– to 7-nerved, short-hairy, especially on the keel and along the margins or occasionally only near the base, entire to minutely emarginate at the sharply acute to subacute apex (sometimes split and appearing apically toothed), the awn terminal or subterminal, 5–10 (12) mm long, straight or sinuous; anthers 2–4 mm long; $2n = 14$. Aspen-spruce-fir communities at 1825 to 2300 m in Salt Lake County; British Columbia and Alberta south to California, Idaho, and Wyoming; 9 (iii).

***Buchloe* Engelm.**

Low, dioecious or occasionally monoecious, stoloniferous perennial; sheaths open; ligule a ring of hairs; staminate inflorescence a panicle of racemously arranged, spike-like branches; pistillate inflorescence a panicle of several headlike clusters on a common peduncle, the whole scarcely emergent from the uppermost sheaths; spikelets dimorphic, sessile or nearly so. *Buchloe* is a monotypic North American genus.

***Buchloe dactyloides* (Nutt.) Engelm.** Buffalo Grass. [*Sesleria dactyloides* Nutt.]. Plant mat-forming; culms 0.5–3 dm tall, densely tufted from subsurface branches or in small tufts from the nodes of elongate stolons; sheaths glabrous or more often pubescent with long spreading hairs; blades flat to involute, 1–2.5 mm wide, 0.2–1 dm long, usually sparsely pubescent with hairs mostly 1–2 (3) mm long; ligule a ring of hairs to ca 1 mm long; staminate panicle elevated above the basal leaf blades on slender culms to ca 2.5 dm tall, composed of 1–5 racemously arranged, 1-sided, spike-like branches 0.5–1.5 cm long, each disarticulating at its base and falling as a unit; pistillate panicle exceeded by the leaves, made up of 2–7 small headlike clusters borne on a short common peduncle, the panicle partially included in the somewhat inflated upper sheaths, each branch disarticulating at the base and falling as a unit, the hardened upper portion of the rachis united with the modified second glumes of the spikelets to form a cuplike structure; staminate spikelets 2-flowered, 4–6 mm long, the glumes lanceolate, unequal, shorter than the lemmas, somewhat laterally compressed to rounded on the back, 1-nerved, the lemma membranous, 3-nerved, acute, the anthers 2–3.5 mm long; pistillate spikelets 1-flowered, sessile or subsessile, (2) 3–5 (7) in

each headlike cluster, the first glume usually reduced, the second broad, hardened, rounded on the back and apically 3-lobed, the lemma thin but firm, 3-nerved, each of the nerves prolonged as awn tips; $2n = 20, 40, 60$. Known by a single collection (Welsh & Moore 18709 BRY) from the margin of a maintained grassy campground at ca 2044 m in Daggett County; Montana through Wyoming to Mexico and through most of the central states; 1 (0). Buffalo grass is a dominant species of the shortgrass prairie of the western Great Plains, and our single population may represent an introduction. The species is an excellent source of forage, curing on the ground and providing nutritious feed during the winter. It is drought resistant, adapted to grazing, and provides erosion control on heavy soils.

***Calamagrostis* Adanson**

Perennials; sheath open; blades flat to involute; ligule membranous; inflorescence an open to spike-like panicle; spikelets compressed to subterete, narrowly lanceolate to elliptical, 1 (2)–flowered, the rachilla disarticulating above the glumes and prolonged behind the palea as a short, often hairy, bristlelike structure; glumes equal or nearly so, as long as or longer than the floret, the first 1-nerved, the second 1- or 3-nerved; lemma often membranous, laterally flattened to subterete, 3- to 5-nerved, the lateral nerves often prolonged as 4 minute bristlelike teeth, a slender awn arising anywhere from near the base to just below the apex, occasionally the awn lacking; callus well developed, with lateral tufts of hair exceeding or not less than 1/6 the length of the lemma; palea subequal to or shorter than the lemma; stamens 3; caryopsis free within the lemma and palea, the embryo less than half as long as the grain; $x = 7$. Complexity within this genus derives from the frequency of hybridization among closely related species and possibly from the existence of apomixis in some species complexes. According to Nygren (1954, 1958), apomixis occurs in three of our species: *C. canadensis*, *C. purpurascens*, and *C. stricta* (as *C. inexas*). *Calamagrostis epigejos* (L.) Roth, native to Eurasia and introduced in the Great Plains, has been grown in experimental plots in Utah but is not otherwise known for the State. The plant is readily distinguished from native species by its long, linear-subulate glumes and by the abundant callus hairs, these at least one and a half times as long as the lemma.

Nygren, A. 1954. Investigations on North American *Calamagrostis* I. Hereditas 40: 377–397.

— . 1958. Investigations on North American *Calamagrostis* II. Lantbrukshögskolans Ann. 24: 363–368.

Stebbins, G. L. Jr. 1930. A revision of some North American species of *Calamagrostis*. Rhodora 32: 35–57.

1. Awns 2–9 mm long, at maturity geniculate and generally twisted below the bend, typically arising below midlength of the lemma; callus hairs mostly less than half as long as the lemma 2
- Awns to ca 3 mm long, straight or bent but not usually twisted below, arising above or below midlength of the lemma, fragile, often obscure, sometimes lacking; callus hairs from 1/3 to as long as the lemma 3
- 2(1). Glumes averaging less than 5 (3–5.5) mm long, awn 2–4.5 mm long; panicle typically pale greenish to tawny *C. rubescens*
- Glumes averaging more than 5 (5–9) mm long; awn 4–9 mm long; panicle usually purple or purple-tinged *C. purpurascens*

- 3(1). Pedicels mostly smooth; anthers 2–3 mm long *C. scopulorum*
 — Pedicels regularly scabrous; anthers 1–3 mm long 4
 4(3). Callus hairs as long as the lemma or nearly so 5
 — Callus hairs not more than 2/3 as long as the lemma 6
 5(4). Glumes gradually long-tapered, often to nearly awnlike tips; panicles ultimately open and often more than 3 cm wide; blades typically dark to bright green and lax. 2–10 mm wide and flat *C. canadensis*
 — Glumes mostly abruptly acute, sometimes with minute apiculate tips; panicles contracted or open at flowering but rarely more than 3 cm wide when pressed; blades often light green and mostly stiffly ascending. 1–5 (6) mm wide, often folded to involute *C. stricta*
 6(4). Glumes averaging at least 4 (4–6.5) mm long; anthers 2–3 mm long; herbage typically pale blue green *C. scopulorum*
 — Glumes averaging less than 4 (2–4.2) mm long; anthers 1–2 mm long; herbage often yellow green *C. stricta*

Calamagrostis canadensis (Michx.) Beauv. Bluejoint Reedgrass. [*Arundo canadensis* Michx.; *C. langsdorffii* (Link) Trin.; *C. purpurea* (Trin.) Trin.]. Rhizomatous perennial; culms 0.4–1.8 m tall; herbage typically bright to dark green; sheaths glabrous or scaberulous; blades 2–8 (10) mm wide, usually flat and lax, scabrous; ligule 3–10 (12) mm long; panicle open or occasionally dense and narrow, 6–25 cm long, scabrous throughout; spikelets 1 (2) –flowered, the prolongation of the rachilla minute, long-bearded; glumes lanceolate, 3–5 (6) mm long, long-tapered to sharply acute, often awnlike tips to ca 1 mm long, scabrous throughout or only on the keel, often purple-tinged to purple; lemma usually thinner than the glumes, 2.5–4 mm long, the awn fragile, straight, arising slightly below to slightly above midlength, 1.2–3 mm long; callus hairs abundant and about equal to the lemma; anthers 1–2 mm long, typically without pollen development; $2n = 28, 42–66$. Meadows and other moist sites in aspen, spruce-fir, and lodgepole pine communities, and occasionally in alpine meadows, at 1950 to 3355 m in Beaver, Cache, Daggett, Duchesne, Emery, Garfield, Grand, Juab, Morgan, Rich, Salt Lake, San Juan, Sanpete, Sevier, Summit, Uintah, Utah, Wasatch, and Washington counties; circumboreal, south in the U. S. through all but the Southeast; Eurasia; 89 (v). Although *C. canadensis* has long been regarded as a North American species distinct from the Eurasian *C. purpurea*, N. N. Tsvelev of the U. S. S. R. found representative specimens of our material (e.g., Dick s.n. UT) indistinguishable from *C. purpurea*. The basionym *Arundo canadensis* Michx. (1803), being older than *A. purpurea* (1820), *C. canadensis* remains the correct name for this circumboreal species. *Calamagrostis canadensis* appears to hybridize freely with *C. stricta* (e.g., Taye 2836 UT) and with *C. scopulorum* (e.g., Harper s.n. BRY). The grass forms dense stands in moist places in the mountains but, because of the coarseness of the leaves and stems, is only moderately palatable to grazing animals. Only on the high mountains where little else grows does it acquire some significance as a source of forage.

Calamagrostis purpurascens R. Br. in Richards. Purple Reedgrass. Perennial, often with short rhizomes; culms strongly tufted, 1.5–10 dm tall; herbage green or glaucous; sheaths glabrous or scaberulous; blades (1) 2–5 mm wide, flat to involute, smooth or scabrous to minutely

hairy; ligule 1–6.5 mm long; panicle narrow, often spike-like, 4–17 cm long and mostly 0.8–1.5 cm wide, dense to occasionally somewhat interrupted, often purple, the branches mostly short and erect (spreading at flowering), scabrid-puberulent to puberulent or rarely scabrous; spikelets 1 (2) –flowered, the prolongation of the rachilla long-hairy; glumes lanceolate, (5) 6–8 (9) mm long, long-tapered to a sharply acute tip, glabrous or scaberulous to puberulent, usually purple or purple-tinged; lemma scarcely thinner than the glumes, 4–7 mm long, glabrous or scaberulous, the awn relatively stout, especially below, ultimately twisted and geniculate, typically arising from the lower 1/3, mostly 4–9 mm long, often exceeding the spikelet by 2 mm or more, rarely lacking; callus hairs less than half as long as the lemma, occasionally lacking; anthers 1.5–3 mm long; $2n = 28, 40–58, 84$. Open rocky slopes, aspen-spruce-fir, meadow, and lodgepole pine communities at (2290) 2740 to 3965 m in Daggett, Duchesne, Grand, Iron, Juab, Piute, Salt Lake, San Juan, Sevier, Summit, and Uintah counties; subarctic America south through most of the western U. S., east to South Dakota and Minnesota; Siberia; 78 (v). A specimen of *C. scopulorum* (Harrison 11301 UT), collected near a population of *C. purpurascens* (Harrison 11282 BRY), is atypical in having the yellow green foliage and scabrid-puberulent panicle branches of *C. purpurascens*, suggesting that hybridization between the two species is occurring.

Calamagrostis rubescens Buckley Pinegrass. Rhizomatous perennial; culms (4) 7–11 dm tall; herbage yellow green to dark green; sheaths glabrous or pubescent, often hairy on the collar; blades flat or folded, 1.5–5.5 mm wide, scabrous to hairy; ligule 1–4 (5) mm long; panicle narrow, mostly 6–20 cm long and to ca 3 cm wide at flowering, loose to compact with branches mostly less than 2 cm long, erect or somewhat spreading at flowering, typically pale greenish to tawny, the branches and pedicels scabrous to more often scabrid-puberulent; spikelets 1–flowered, the prolonged rachilla conspicuously hairy; glumes lanceolate, (3) 4–5.5 mm long, mostly gradually tapered to an acute apex, smooth throughout or scabrous on the keel, occasionally scaberulous over the back, usually whitish to pale green or tawny; lemma similar to the glumes in texture, 2.5–4 mm long, glabrous or scaberulous, the awn relatively stout, arising below midlength, at maturity geniculate and twisted below the bend, 2–4.5 mm long; callus hairs to ca 1 mm long, usually sparse; anthers 1.5–2.8 mm long; $2n = 28, 42, 56$. Ponderosa pine, aspen, and more commonly lodgepole pine communities, commonly intermixed with *Carex geyeri*, at 2440 to 2745 m in Daggett, Rich, and Uintah counties (Uinta Mts.); British Columbia to Manitoba, south to California, Idaho, and Colorado; 4 (0). Pinegrass is shade tolerant but rarely flowers except in cutover areas. It is important as a sod-former and, although unpalatable at maturity when its herbage becomes tough and harsh, is highly palatable during the spring (Valentine 1961).

Calamagrostis scopulorum Jones Jones Reedgrass. [*C. scopulorum* var. *lucidula* Kearney, type from the Wasatch Range]. Perennial, often with short rhizomes; culms usually loosely tufted, 3–9 dm tall; herbage pale blue green or rarely yellow green to dark green; sheaths glabrous or scaberulous; blades 1–7 (11) mm wide, flat or folded, mostly firm and erect-ascending, generally scaberulous; ligule 2–5 mm long; panicle narrow, mostly

5–20 cm long and to ca 3 cm wide at flowering, typically compact with branches erect to slightly spreading at flowering, the branches and pedicels smooth or sparingly scabrous; spikelets 1 (2)–flowered, the prolongation of the rachilla minute, long-hairy; glumes lanceolate to elliptical, 4–6 (6.5) mm long, abruptly acute to long-tapered at the apex, glabrous or more often the keel scaberulous, usually whitish to pale green or brownish purple, occasionally dark purple; lemma scarcely thinner than the glumes, (3) 3.5–5 mm long, glabrous or scaberulous, the awn delicate (occasionally lacking) erect or rarely spreading, not twisted near the base, arising near or above midlength, to ca 2 mm long; callus with the longer hairs from 1/3–2/3 as long as the lemma, rarely longer; anthers 2–3 mm long; $2n = 28$. Hanging gardens and other rocky sites, streamside and in meadow communities, occasionally in conifer woodlands and krummholtz, at 1070 to 3510 m in Daggett, Duchesne, Emery, Garfield, Grand, Iron, Juab, Kane, Salt Lake, San Juan, Sanpete, Summit, Uintah, Utah, Wasatch, and Washington (type from Springdale) counties; Montana south to Arizona and New Mexico; 107 (0). *Calamagrostis scopulorum* apparently hybridizes with *C. purpurascens* (q.v.), *C. canadensis* (e.g., Welsh, Neese, & Atwood 19075 BRV), and *C. stricta* (e.g., Neese 14881 BRV).

Calamagrostis stricta (Timm) Koeler Slimstem or Northern Reedgrass. [*Arundo stricta* Timm; *C. inxpansa* Gray; *C. neglecta* authors, not (Ehrh.) Gaertn., Mey. & Scherb.]. Rhizomatous perennial; herbage typically yellow green, occasionally glaucous to dark green; culms 3–13 dm tall; sheaths glabrous or scaberulous; blades 1–5 (6) mm wide, flat to involute, mostly firm and ascending, smooth or scabrous to puberulent; ligule 0.7–7 (10) mm long; panicles dense and narrow or rarely open, 6–25 cm long and mostly less than 3 cm wide, the branches erect to strongly ascending or more or less spreading at flowering, regularly scabrous throughout; spikelets 1 (2)–flowered, the prolongation of the rachilla minute, long-bearded; glumes lanceolate to elliptical, 2–4.2 mm long, abruptly acute at the apex or occasionally some of them long-tapered, glabrous or scaberulous, green but soon turning golden brown, occasionally purple-tinged; lemma similar to the glumes, 1.8–3.2 mm long, scaberulous or rarely glabrous, the awn straight or rarely bent but not twisted below, arising from above or below midlength, mostly 1–2.5 mm long; callus hairs rather sparse, from 2/3 to as long as the lemma; anthers 1.3–2 mm long; $2n = 28, 56, 58, 70, 84–105$. Moist sites, often streamside, in ponderosa pine, spruce-fir, lodgepole pine, and meadow communities at 1280 to 3230 m in Beaver, Cache, Daggett, Duchesne, Emery, Garfield, Grand, Iron, Kane, Rich, Salt Lake, San Juan, Sanpete, Sevier, Summit, Uintah, Utah, Wasatch, Washington, and Wayne counties; circumboreal, south throughout the western and northeastern U. S.; South America; Eurasia; 118 (ii). I have followed Tutin et al. (1980), Love (Taxon 19: 299–300, 1970), and Voss (Michigan Bot. 11: 28–29, 1972) in referring this taxon to *C. stricta*. See *C. canadensis* and *C. scopulorum* for comments concerning possible hybrid formation.

Calamovilfa Hackel

Rhizomatous perennials; culms usually tall and stout; sheaths open; blades firm, flat to involute; ligule a ring of

short hairs; inflorescence an open or contracted panicle; spikelets compressed to subterete, 1–flowered, disarticulating above the glumes; glumes unequal, keeled to rounded on the back, 1–nerved; lemma becoming leathery, more or less rounded on the back, 1–nerved, awnless; callus bearded; palea about equal to the lemma; caryopsis free of the pericarp; $x = 10$.

Reeder, J. R. and M. E. Ellington. 1960. *Calamovilfa*, a misplaced genus of Gramineae. *Brittonia* 12: 71–77.

Calamovilfa gigantea (Nutt.) Scribn. & Merr. Big Sandreed. [*Calamagrostis gigantea* Nutt.]. Tall, coarse, rhizomatous perennial; sheaths glabrous except occasionally near the collar; culms mostly solitary at each rhizome node, 1–2 m tall; ligule a ring of hairs 1–2 mm long; blades firm, flat to involute, 5–12 mm wide, tapering into a long, ultimately filiform tip; panicle mostly 3–6 dm long, pale green to tawny, open, the branches to ca 2.5 dm long, mostly solitary at each node and somewhat distantly spaced, stiffly erect to widely spreading, naked at the base; spikelets short-pedicelled, narrowly lanceolate, mostly 7–9 mm long; glumes usually firm, unequal, 1–nerved, obtuse to acute apically, the second shorter than or slightly exceeding the lemma; lemma narrowly lanceolate, 1–nerved, acute, hairy on the back above the base; callus with a dense tuft of silky hairs 3–5 mm long; anthers 3–5.5 mm long; $2n = 60$. Sand dunes and sandy soil in sagebrush, pinyon-juniper, and ponderosa pine communities below 1830 m in Kane, San Juan, and Washington counties; Arizona and Colorado, east in the southern Great Plains; 13 (0). Big sandreed is a good sand binder but is too coarse to be of value as forage.

Catabrosa Beauv.

Perennial; sheaths closed 1/2–3/4 the length; blades lax, flat; ligule membranous; inflorescence an open panicle; spikelets subterete, (1) 2 (3)–flowered, disarticulating above the glumes and between the florets; glumes unequal, linear to obovate, shorter than the lowermost lemma; lemma rounded on the back, prominently 3–nerved, the nerves parallel or nearly so; palea similar to the lemma in texture and size; caryopsis free of the lemma and palea, the hilum ovate, 1/4 as long as the grain; stamens 3; $x = 5$. *Catabrosa* is an ampho-Atlantic monotypic genus.

Catabrosa aquatica (L.) Beauv. Brookgrass. [*Aira aquatica* L.]. Perennial, often stoloniferous or rhizomatous; culms 0.5–7 (8) dm tall, erect or decumbent, freely rooting at the lower nodes; sheaths glabrous; blades lax, flat, 2–13 mm wide, typically prow-shaped at the tips, essentially smooth; ligule 1.5–8 mm long; panicle open, ovate to oblong, 0.7–3 dm long, erect, the branches smooth, ascending to widely spreading or descending; spikelets terete to somewhat dorsiventrally compressed, 2 (3)–flowered, blunt-elliptical, 1.6–3.5 (4) mm long; glumes thin, often pale, linear to fan-shaped, obscurely nerved, much shorter than the lowermost floret, the first glume often much reduced, the second 1.2–2.5 mm long, acute to rounded or truncate and erose to irregularly toothed apically; lemma somewhat fleshy, typically yellow brown to greenish, 1.5–3.5 mm long, rounded on the back, glabrous, with 3 prominent, nearly parallel nerves, the apex membranous, truncate and erose; anthers 0.7–1.8 mm long; $2n = 20, 42$. Wetland or aquatic grass associated with streams, springs, wet meadows, and

marshes, in oak-maple, aspen-spruce-fir, and ponderosa pine communities at 1310 to 3110 m in all Utah counties except Daggett, Millard, San Juan, and Weber; Alberta to Newfoundland, south through most of the western U. S., the Dakotas, Nebraska, and Wisconsin; Eurasia; Africa; introduced in South America; 144 (vi). Brookgrass is a fairly good pasture plant but can produce severe acid poisoning in cattle if consumed in large quantities (Tsvelev 1984).

Cenchrus L.

Annuals or perennials; culms erect or more often decumbent to prostrate; sheaths open, often compressed and more or less keeled; blades flat to involute; ligule a membranous-based fringe of hairs or lacking; inflorescence a spike-like panicle consisting of few to numerous, sessile, spiny burs (formed by the partial fusion of modified sterile branchlets) arranged along a short unbranched rachis, each bur partially enclosing 1–3 (8) spikelets and falling intact at maturity; spikelets sessile within the bur, 2-flowered, the lower floret staminate or neutral, the upper one perfect; glumes membranous, unequal, ovate to lanceolate, the first 1– to 3-nerved, sometimes reduced or lacking, the second 1– to 7-nerved, nearly as long as the spikelet; lemma of the sterile lower floret similar in texture and size to the second glume, 3– to 7-nerved, the palea smaller than the lemma; lemma of the upper, fertile floret usually firm, smooth, and obscurely nerved, the margins inrolled around the palea; caryopsis free of but firmly enclosed within the lemma and palea, the embryo at least half the length of the grain; $x = 9$.

DeLisle, D. G. 1963. Taxonomy and distribution of the genus *Cenchrus*. Iowa State J. Sci. 37: 259–351.

Cenchrus longispinus (Hackel) Fern. Field Sandbur. [*C. echinatus* f. *longispinus* Hackel; *C. pauciflorus* authors, not Benth.]. Annual, often forming large clumps with culms ascending to decumbent or prostrate, 0.4–9 dm long; sheaths compressed, open and loose, glabrous or occasionally long-hairy; blades mostly flat, (1.5) 3–9 mm wide and to ca 20 cm long, scabrous to sparsely long-hairy; ligule a ciliate membrane, 0.7–1.7 mm long; inflorescence spike-like, (1.5) 3–10 cm long; burs subglobose, subglabrous to densely pubescent, the body 6–12 mm long and 3–7 mm wide, cleft on two sides, the spines 45–75, irregularly spaced, 1–6 (7) mm long and 0.1–1.4 mm wide at the terete to flattened base, spreading or reflexed, several to many of the numerous spines near the base of the bur bristle-like; spikelets 2–3 (4) per bur, 6–8 mm long; first glume 1.5–3.8 mm long, 1-nerved; second glume 4.4–6 mm long, 3– to 5-nerved; sterile lower lemma similar to but sometimes slightly longer than the second glume, the palea usually smaller than the lemma; fertile upper lemma firm and smooth, 5.8–7.6 mm long, obscurely nerved; anthers 0.6–2 mm long; $2n = 34$, 36. Fields, gardens, and other disturbed sites chiefly below 1830 m in Box Elder, Davis, Garfield, Grand, Kane, Salt Lake, San Juan, Uintah, Utah, Washington, Wayne, and Weber counties; Ontario, south through most of the U. S.; Mexico to Venezuela; introduced in Europe; 28 (iii).

Chloris Swartz

Annuals or perennials; sheaths open, rounded to flattened and keeled; blades flat or folded; ligule membra-

nous or sometimes lacking; inflorescence a panicle with 2–20 spike-like branches digitately or racemously arranged, the spikelets sessile or short-pedicelled and overlapping to remote along one side of the slender, more or less 3-angled rachis; spikelets flattened to subterete, 2– to 4-flowered, disarticulating above the glumes, pale to brownish, the lower floret perfect, the upper 1–3 florets staminate or rudimentary, rarely perfect; glumes membranous or nearly so, subequal or unequal, lanceolate, acute to long-tapered, 1-nerved, the second shorter to longer than the florets; lemma of the perfect lower floret laterally compressed and keeled to subterete, 1– to 5-nerved, glabrous or variously pubescent to scabrous on the nerves and margins, often minutely bearded on the callus, awnless or more often awned from the tip or from between two small apical teeth; lemma of the upper sterile floret(s) frequently reduced to a club-shaped, awned or awnless rudiment; paleas shorter than the lemmas; caryopsis free within the lemma and palea, the pericarp only partially fused with the outer seed coat, the embryo to ca 3/4 the length of the grain; $x = 10$.

Anderson, D. E. 1975. *Chloris* Swartz. pp. 316–333. In: F. W. Gould, The grasses of Texas. Texas A. & M. University Press, College Station.

1. Lower lemma densely long-hairy on the margin just below the apex, the hairs mostly 2–3 mm long; plants annual *C. virgata*
- Lower lemma pubescent with very short hairs; plants perennial *C. verticillata*

Chloris verticillata Nutt. Tumble Windmillgrass. Tufted perennial; culms 4 dm tall, erect or decumbent at the base, often rooting at subsurface nodes; sheaths glabrous or long-hairy at the summit; blades flat or folded, 1–4 mm wide, abruptly acute to obtuse at the tips, usually scabrous; ligule membranous, mostly ca 1 mm long, occasionally subtended at the base of the blade by hairs to 3 mm or more long; panicle of 10–20 ultimately divergent, slender, spike-like branches, these mostly 5–16 cm long, in 2–5 more or less closely spaced whorls, some of the branches occasionally racemously arranged, the spikelets in 1 row, sessile to short-pedicelled, appressed to the rachis and usually slightly overlapping or more or less remote, especially near the base of the branches; spikelets 2–4 mm long excluding awns, 2-flowered, the lower floret perfect, the upper typically reduced; glumes unequal, narrowly lanceolate, 1-nerved, awn-tipped, the second glume to 4 mm long including the awn tip, slightly longer than the upper floret; lemma of the perfect lower floret firm, strongly laterally compressed, lanceolate to elliptical, 2–3.5 mm long, pale green or whitish to tawny, occasionally purple-tinged, 3-nerved, glabrous or minutely hairy on the keel, short-hairy on the marginal nerves, acute or nearly so at the entire to minutely toothed apex, an awn 4–9 mm long arising just below the apex; lemma of the upper floret oblong to broadly club-shaped, 1–2.3 mm long, often somewhat inflated, glabrous, truncate apically, with an awn 3–7 mm long; $2n = 40$. Weed of cultivated areas below 1830 m in Emery and Salt Lake counties; most of the southwestern U. S., east to Indiana and Louisiana, introduced in Maryland; 9 (0).

Chloris virgata Swartz Feather Fingergrass. Annual; culms usually tufted, mostly 2–10 dm tall, sparingly branched above the base, often geniculate at the lower

nodes; sheaths glabrous, occasionally long-hairy near the ligule; blades flat, 2–15 mm wide, tapered to sharply acute tips, glabrous or scabrous to long-hairy; ligule membranous, 0.2–1 mm long, occasionally lacking; panicle of 3–20 erect to strongly ascending, spike-like branches 2–10 cm long in a terminal whorl on the culm, the whole breaking away at maturity, the spikelets in 2 rows, mostly subsessile, closely overlapping throughout the length of the branch; spikelets 2.5–4.2 mm long excluding awns, 2 (3) -flowered, the lower floret perfect, the upper 1 (2) typically reduced; glumes unequal, narrowly lanceolate, 1-nerved, the second glume short-awned, to 4.3 mm long including the awn, usually equal to or slightly longer than the upper floret; lemma of the perfect lower floret firm, strongly laterally compressed, skewed-elliptical, 2.5–4.2 mm long, pale green or whitish to tawny, often purple-tinged, 3-nerved, the keel glabrous or densely short-hairy, the marginal nerves densely hairy along the upper 1/3 with hairs mostly 2–3 mm long and obscurely hairy below, acute or nearly so at the entire to minutely toothed apex with a subterminal awn 5–12 mm long; lemma of the upper 1 (2) florets narrowly club-shaped, 1.4–3 mm long, glabrous, truncate apically, with an awn 3–9.5 mm long; $2n = 14, 20, 26, 30, 40$. Along waterways and roadsides, and as a weed of irrigated sites chiefly below 1830 m in Grand, Juab, Kane, and Washington counties; southwestern and south-central U. S., into Mexico, and along most of the east coast from Maine to Florida; South America; Asia and Africa; 21 (0).

Cinna L.

Perennials; sheaths open; blades flat; ligule membranous; inflorescence a panicle; spikelets laterally compressed, 1-flowered, disarticulating below and sometimes above the glumes; glumes about equal to the floret, narrowly lanceolate, 1- to 3-nerved; lemma similar to the glumes, 3-nerved, awnless or a short straight awn arising just below the tip; palea nearly equal to the lemma; stamens 1–3; caryopsis free within the lemma and palea, the hilum oval, 1/7–1/6 the length of the grain; $x = 7$.

Cinna latifolia (Trev. ex Goepfert) Griseb. Drooping Woodreed. [*Agrostis latifolia* Trev. ex Goepfert]. Rhizomatous perennial; culms loosely tufted, 0.5–2 m tall; sheaths glabrous or scabrous; blades lax, flat, (5) 7–17 (20) mm wide, scabrous; ligule brownish, (2) 3–8 mm long; panicle open, nodding, light green, 1–3 dm long; spikelets 2–4 (4.5) mm long and to ca 1 mm wide, disarticulating below and sometimes also above the glumes, the rachilla prolonged behind the palea as a bristlelike structure ca 0.5 mm long; glumes equal or nearly so, narrowly lanceolate, 2–4 (4.5) mm long, equal to or exceeding the floret, 1-nerved, typically strongly keeled along the mid-nerve, tapered to a sharply acute to awnlike apex, strongly scabrous to short-ciliate on the keel and often scaberulous over the back; lemma obscurely 3-nerved, glabrous or more often scaberulous, awnless or with a subterminal awn to 1.2 mm long; anthers 0.6–1 mm long; $2n = 28$. Chiefly streamside in mountain brush, aspen, and spruce-fir communities at 1710 to 2595 m in Juab, Millard, Salt Lake, Summit, Tooele, Uintah, Utah, and Wasatch counties; circumboreal, south through most of the western U. S., the northern Great Plains, and the Northeast; Eurasia; 50 (viii).

Crypsis Ait.

Annuals; culms prostrate to erect, usually much branched from the base and often from leaf axils; sheaths open; blades mostly short, flat to involute; ligule a ring of short hairs; inflorescence a spike-like panicle; spikelets 1-flowered, strongly compressed, disarticulating below and sometimes above the glumes; glumes subequal or unequal, 1-nerved, keeled, typically shorter than or occasionally equal to the lemma, acute; lemma keeled, 1-nerved, acute or mucronate to short-awned; palea equal to or slightly shorter than the lemma, (1) 2-nerved; stamens 2 or 3; caryopsis ellipsoidal to oblong, the pericarp swelling upon becoming wet and usually ejecting the seed, the embryo almost as long as the seed; $x = 9$.

Hammel, B. E. and J. R. Reeder. 1979. The genus *Crypsis* (Gramineae) in the United States. *Syst. Bot.* 4: 267–280.

1. Panicles mostly less than 5 (2.5–8) mm wide, at flowering free of the upper, unexpanded sheath; spikelets often black-tinged, lemma averaging less than 3 (1.5–3) mm long *C. alopecuroides*
- Panicles mostly more than 5 (5–15) mm wide, typically remaining partially enclosed within the expanded upper sheath; spikelets pale to purple-tinged; lemmas often averaging 3 (2.4–4) mm or longer *C. schoenoides*

Crypsis alopecuroides (Piller & Mitterp.) Schrader Pricklegrass. [*Phleum alopecuroides* Piller & Mitterp.; *Heleochoa alopecuroides* (Piller & Mitterp.) Host]. Annual; herbage frequently purple to nearly black; culms prostrate to ascending, 0.3–2 (7) dm long, branched from the base, rarely above, often geniculate at the lower nodes; sheaths glabrous or some of them minutely ciliate below the summit; blades flat to loosely involute, mostly 1–12 cm long and 1–2.5 mm wide, glabrous or scaberulous, often hairy near the ligule; ligule a ring of hairs 0.2–1 mm long; panicle spike-like, cylindrical, 0.5–6.5 (8) cm long and 2.5–8 mm wide, at flowering borne above the unexpanded upper sheath; spikelets 1-flowered, strongly overlapping, often black-tinged; glumes subequal or unequal, 1-nerved, glabrous or scaberulous to minutely ciliate on the keel, the first narrowly lanceolate, 1–1.7 (2) mm long, the second slightly broader than the first, 1.2–2 (2.4) mm long, both usually shorter than the lemma; lemma lanceolate, 1.5–2.4 (3) mm long, 1-nerved, keeled, glabrous; anthers 0.5–1 mm long; $2n = 18$. Margins of lakes, ponds, and waterways, and in drying reservoir bottoms, below 1830 m in Cache and Millard counties; native to Eurasia; introduced in the U. S. from Washington to California, also reported from Idaho, Nevada, Wyoming, Montana, and Pennsylvania; 3 (0).

Crypsis schoenoides (L.) Lam. Common Pricklegrass. [*Phleum schoenoides* L.; *Heleochoa schoenoides* (L.) Host ex Roemer]. Annual; herbage frequently purple-tinged; culms prostrate to erect, 0.3–4 (7) dm long, branched from the base, occasionally above, often mat-forming; sheaths glabrous or some of them minutely ciliate below the summit, the uppermost inflated; blades flat or often involute, especially toward the long-tapered tips, mostly 2–10 cm long and 1–4 mm wide, glabrous or short-hairy; ligule a ring of hairs 0.5–1 mm long; panicle spike-like, ovoid to cylindrical, 0.3–5 (7.5) cm long and 5–15 mm wide, typically remaining partially enveloped by the

spathelike upper sheath; spikelets 1-flowered, strongly overlapping, pale to purple-tinged; glumes subequal, narrowly lanceolate, 1.8–2.7 mm long, usually shorter than the lemma, 1-nerved, glabrous or scaberulous to minutely ciliate on the keel; lemma lanceolate, 2.4–3 (4) mm long, 1-nerved, glabrous or the keel scaberulous; anthers 0.7–1 mm long; $2n = 32, 36$. Drying margins of lakes, ponds, and waterways, and in reservoir drawdown areas below 1525 m in Box Elder and Washington counties; native to Eurasia, adventive in California, Oregon, and Nevada, and sporadic in the East; 8 (0).

Cynodon Rich.

Perennials with stolons or rhizomes; culms simple to much branched; sheaths open; blades short, flat to involute; ligule membranous; inflorescence a panicle of 2–8 slender spikeletlike branches in one or more whorls at the summit of the culm, the spikelets sessile or nearly so, typically in 2 rows along one side of a 3-angled rachis; spikelets 1 (2) -flowered, laterally compressed, the rachilla disarticulating above the glumes and prolonged behind the palea as a slender bristlelike structure, sometimes bearing a second, usually rudimentary floret; glumes subequal or unequal, 1-nerved, keeled, shorter than the lemma; lemma firmer than the glumes, laterally compressed, obscurely 3-nerved, the lateral nerves submarginal, the keel ciliate; palea subequal to the lemma, much narrower; stamens 3; caryopsis free within the lemma and palea, the embryo ca 1/2 the length of the grain; $x = 9$.

de Wet, J. M. J. and J. R. Harlan. 1970. Biosystematics of *Cynodon* L. C. Rich. (Gramineae). *Taxon* 19: 565–569.

Cynodon dactylon (L.) Pers. Bermuda Grass. [*Panicum dactylon* L.; *Capriola dactylon* (L.) Kuntze]. Perennial with stolons or rhizomes; culms; decumbent to prostrate, 2–8 dm long, leafy, rooting at the lower nodes and producing erect flowering shoots 1–5 dm tall; sheaths smooth below, often hairy near the summit; blades flat or folded, 1.5–5 (15) mm wide, glabrous or scaberulous to sparsely hairy; ligule a ciliate membrane less than 0.5 mm long, subtended at the base of the blade by hairs 1–3 mm long or longer; panicle of (2) 3–7 (10) spikeletlike branches, these 2–8 (10) cm long, in a single whorl at the apex of the culm or rarely in 2–4 whorls, the spikelets sessile, appressed to the rachis, closely overlapping and alternating in 2 rows (often appearing to be a single row) on one side of a 3-angled rachis; spikelets 1.8–2.8 mm long, typically 1-flowered; glumes 1-nerved, keeled, the first narrowly crescent-shaped or lanceolate, 0.7–1.8 mm long, the second narrowly lanceolate, 1.2–2.2 mm long and scarcely if at all wider than the first, typically shorter than the lemma; lemma firmer than the glumes, boat-shaped, 1.8–2.5 mm long, smooth, keeled, usually pale green to whitish or purple-tinged, glabrous or scabrous to pubescent on the keel and submarginal lateral nerves; anthers 0.6–1 mm long; caryopsis almond-shaped, to ca 1.4 mm long; $2n = 18, 27, 30, 36, 40, 54$. A weed of lawns, and waste places, and along waterways below 1525 m in Cache, Salt Lake, Utah, Washington, and Weber counties; native to Africa, widely introduced in the U. S. and Mexico; South America; Eurasia; 28 (i). Bermuda grass, introduced to the U. S. as early as 1751, is frequently cultivated in the South as a pasture and lawn grass. The species is cited by Holmgren and Maguire (Utah State

Circ. 123: 7. 1949) as having become a serious pest in Utah sometime during the 1940s. Its presence as a lawn weed has increased appreciably in some areas of the state in recent years.

Dactylis L.

Perennial; sheaths closed throughout or open to half their length; ligule membranous; inflorescence a panicle with spikelets in dense clusters on short to relatively long, erect to reflexed branches; spikelets laterally compressed, 2- to 5-flowered; glumes subequal to unequal, keeled, 1- to 3-nerved; lemmas firm, keeled, 5-nerved, usually obscurely so; palea shorter than the lemma; stamens 3; caryopsis free within or slightly adherent to the lemma and palea; $x = 7$. *Dactylis* is a widespread monotypic genus.

Stebbins, G. L., Jr. and D. Zohary. 1959. Cytogenetic and evolutionary studies in the genus *Dactylis*. *Univ. Calif. Publ. Bot.* 31: 1–40.

Dactylis glomerata L. Orchard Grass. Perennial; culms tufted, erect, to 12 dm tall, often with short stout rhizomes; sheaths smooth or scaberulous, often compressed and keeled; blades flat or folded, 1.5–11 mm wide, nearly smooth to strongly scabrous; ligule 2.5–11 mm long; panicle 4–20 cm long, mostly interrupted, the usually few primary branches 1 or 2 (3) at each node of the rachis, ca 0.5–12 cm long or longer, erect to widely spreading or reflexed, naked below and bearing near the tips 1 to several, dense, second clusters of sessile to short-pedicelled spikelets; spikelets 5–9 mm long, 2- to 5 (8) -flowered, occasionally purple-tinged, ultimately disarticulating above the glumes and between the florets; glumes subopposite, lanceolate, often asymmetrical, keeled to rounded on the back, acute to awn-tipped apically, glabrous or scabrous to coarsely ciliate on the keel, otherwise glabrous or occasionally pubescent, the first often longer and firmer than the second, 5–6.5 mm long, the second usually membranous, 3–6 mm long, shorter than the lowermost lemma; lemma mostly firm, lanceolate, (3) 5–6 mm long, keeled, acute or more often tapered to an awnlike tip to ca 2 mm long, coarsely ciliate or rarely only scabrous on the upper portion of the keel, otherwise glabrous or scaberulous; anthers 2–4 mm long; $2n = 14, 21, 27–31, 42$. Sagebrush, mountain brush, ponderosa pine, aspen, spruce-fir, and occasionally desert shrub communities, often in the wake of disturbance, at 850 to 3235 m in all Utah counties except Box Elder, Carbon, and Morgan; native to Eurasia and Africa, now circumboreal, naturalized in temperate regions of the western Hemisphere; 121 (iv). Stebbins and Zohary (1959) agree with most European authors that *Dactylis* is best treated as a monotypic genus. Orchard grass was introduced to the north-central U. S. as a hay and pasture grass sometime prior to 1760 (Valentine 1961). In the West it grows in irrigated areas or in sites with a minimum of 45 cm annual rainfall, although drought-resistant strains have been developed in recent years (Hanson 1972). The grass has been successfully used in range seedings in both mountain brush and aspen-fir communities. Orchard grass produces an abundance of palatable and nutritious forage during spring and summer and is noted for its resistance to close grazing (Valentine 1961).

Danthonia DC.

Tufted perennials; culms often disarticulating at the nodes in age; sheaths open; blades narrow; ligule a ring of

hairs, sometimes with a short membranous base; inflorescence a panicle or raceme, in one species reduced to a single spikelet; spikelets subterete to laterally compressed, (2) 4– to 10–flowered, the florets progressively smaller upward, the rachilla disarticulating above the glumes and between the florets; cleistogamous, 1– or 2–flowered spikelets occasionally present in the axils of the lower leaves; glumes equal or subequal, 1– to 5–nerved, often obscurely so, equal to or longer than the body of the uppermost lemma; lemma broad, somewhat laterally compressed but not keeled, several-nerved, usually obscurely so, bilobed apically, the midnerve typically prolonged between the sometimes short-awned lobes as an elongate, stout, basally flattened, twisted to geniculate awn; callus typically well developed and often bearded; palea nearly as long as the lemma; anthers well developed or in cleistogamous florets minute; caryopsis free within the lemma and palea, ellipsoidal to obovoid, the embryo to ca 3/5 the length of the grain; $x = 9$.

Clay, K. 1953. Variation in the degree of cleistogamy within and among species of the grass *Danthonia*. Amer. J. Bot. 70: 835–843.

- 1. Panicle typically reduced to a single spikelet; sheaths (at least the upper ones) usually conspicuously hairy; lemma with apical lobes acute or, if awnlike, mostly less than 2 mm long; plants rarely more than 3 dm tall *D. unispicata*
- Panicle of multiple spikelets or rarely reduced to one, the sheaths then glabrous or inconspicuously hairy, the lemma with apical lobes mostly awnlike and often more than 2 mm long, and the plants mostly more than 3 dm tall 2
- 2(1). Panicle branches erect or nearly so, glabrous or scabrid-puberulent; lowermost lemmas (including lateral awns) 6–10 mm long *D. intermedia*
- Panicle branches erect to widely spreading, often flexuous, typically hairy; lowermost lemma (including lateral awns) 9.5–15 mm long *D. californica*

***Danthonia californica* Bolander** California Oatgrass. Perennial; culms densely tufted, 3–7 (9) dm tall, erect; sheaths glabrous or with more or less conspicuous tufts of hair lateral to the ligule; blades (0.5) 2–4 (5) mm wide, flat to loosely involute, usually scabrous, occasionally sparsely long-hairy; ligule ca 0.5 mm long; panicle of (1) 2–5 spikelets, the pedicels mostly 0.5–3 cm long, erect to widely spreading, often flexuous, typically pubescent; spikelets 5– to 8–flowered; glumes lanceolate, (10) 14–18 (20) mm long (including the often awnlike tip), exceeded only by the awns of the upper florets; lemma 9.5–13 (15) mm long, hairy on the margin near midlength, otherwise glabrous, the apical lobes usually awnlike, often more than 2 mm long, the terminal awn 5–12 mm long, flattened and twisted at the base; callus densely short-hairy laterally; $2n = 36$. Meadows, open grassy or rocky slopes, and pinyon-juniper, aspen-spruce-fir, and ponderosa pine communities at 1580 to 3050 m in Cache, Daggett, Duchesne, Morgan, Summit, Uintah, Utah, and Wasatch counties; southwestern Canada to Saskatchewan, and throughout the western U. S.; Chile; 29 (ii).

***Danthonia intermedia* Vasey** Timber Oatgrass. [*D. cusickii* (Williams) A. S. Hitchc.]. Perennial; culms densely tufted, 1–5 (7) dm tall, erect; sheaths glabrous or with a tuft of hair on either side of the ligule, occasionally sparsely long-hairy throughout; blades 1–4 mm wide, flat or involute, glabrous or sparsely long-hairy on one or both

surfaces; ligule of hairs to ca 1 mm long; panicle narrow, often secund, 3–6 (9) cm long, with 4–9 (13) spikelets, the branches short and strictly erect or the lowermost somewhat spreading, the pedicels and branches glabrous or scabrid-puberulent; spikelets 3– to 6–flowered; glumes broadly lanceolate, (9) 11–17 (19) mm long, acute, exceeded only by the awns of the upper florets; lemma (6) 7–10 mm long, hairy on the margin near midlength, the apical lobes acute or with awnlike tips 1.5–2.5 mm long, the terminal awn 6–10 mm long, flattened and ultimately twisted at the base; callus long-hairy laterally; $2n = 18, 36$. Dry to moist meadows in spruce-fir and lodgepole pine communities, and on exposed rocky ridges at higher elevations, at 2440 to 3660 m in Beaver, Daggett, Duchesne, Garfield, Grand, Iron, Salt Lake, San Juan, Sanpete, Sevier, Summit, Tooele, Utah, Uintah, and Washington counties; Alaska and across southern Canada, south throughout the western U. S., in South Dakota and Michigan; 70 (ii).

***Danthonia unispicata* (Thurber) Munro ex Macoun** Oneside Oatgrass. [*D. californica* var. *unispicata* Thurber]. Perennial; culms densely tufted to matted, 1–3 (3.5) dm tall, slender and erect to curved-ascending; sheaths (at least some of them) conspicuously pubescent with long, spreading, often papilla-based hairs, the hairs lateral to the ligule usually 2–5 mm long; blades mostly 1–2.5 mm wide, flat to loosely involute, spreading-hairy or rarely glabrous; ligule of hairs to ca 1 mm long; inflorescence typically reduced to a single spikelet, often with the elongate, minutely hairy pedicel jointed to the culm, rarely 1 or 2 mostly smaller spikelets below the terminal one; spikelets 3– to 6–flowered; glumes lanceolate, (9) 12–23 mm long, the second slightly shorter than the first, long-tapered to an acute or awn-tipped apex, exceeded only by the awns of the upper florets; lemma (7) 8–14 mm long, marginally hairy along the lower 2/3, the apical lobes acute or with awnlike tips rarely more than 2 mm long, the terminal awn 3–9 mm long, flattened and twisted, sometimes geniculate at the base; callus minutely bearded; $2n = 36$. Dry to wet sites, in mountain brush, aspen-fir, ponderosa pine, lodgepole pine, and meadow communities, and at higher elevations on open rocky slopes, at 2130 to 3050 m in Cache, Daggett, Davis, Juab, Millard, Salt Lake, Summit, and Uintah counties; British Columbia and Alberta, south through most of the western U. S.; 30 (v).

***Deschampsia* Beauv.**

Annuals or perennials; sheaths open; blades flat to involute, mostly narrow; ligules membranous; inflorescence an open to contracted panicle, often glistening, the branches commonly subcapillary; spikelets lanceolate to oblong, laterally flattened to subterete, 2 (3) –flowered, the rachilla usually hairy, disarticulating above the glumes and between the florets, sometimes prolonged beyond the uppermost floret and then occasionally bearing a rudimentary floret; glumes lanceolate, subequal or unequal, keeled to rounded on the back, broadly membranous-margined, acute to long-tapered at the apex, 1– to 3–nerved, equal to the lower floret, the second usually equal to or exceeding the uppermost floret; lemma thin to firm, smooth and glossy, narrowly lanceolate to ovate, rounded on the back, 5–nerved, often obscurely so, blunt and erose or bilobed to variously toothed apically, a slender, straight or geniculate awn arising from the back;

callus bearded; palea equal to or shorter than the lemma; stamens 3; caryopsis free of but enclosed within the lemma and palea, spindle-shaped, the embryo not more than 1/3 the length of the grain; $x = 7$.

1. First glume averaging shorter than the upper floret; anthers 1.2–3 mm long; panicles ultimately open, often nodding; blades 1–5 mm wide *D. cespitosa*
- First glume equal to or exceeding the upper floret; anthers 0.2–0.7 mm long; panicles sublinear to open, erect; blades 0.5–1.5 mm wide 2
- 2(1). Awn straight or nearly so; panicle sublinear, the branches nearly always strictly erect; plants perennial *D. elongata*
- Awn geniculate; panicle narrow or ultimately open, the branches spreading-ascending; plants annual *D. danthonioides*

***Deschampsia cespitosa* (L.) Beauv.** Tufted Hairgrass. [*Aira cespitosa* L.]. Densely to loosely tufted perennials, 0.4–12 dm tall; leaves chiefly basal; sheaths glabrous or scabrous; blades somewhat stiff, flat to involute, 1–3 (5) mm wide, typically scabrous; ligule 3–11 (15) mm long; panicle narrowly elongate to pyramidal, 0.3–4 (5) dm long, often nodding, becoming silvery or tawny and to some degree purple, the branches erect to ultimately widely spreading, usually naked below; spikelets 2 (3) -flowered, 3–6 (9) mm long, the rachilla hairy; glumes ovate to narrowly lanceolate, keeled to rounded on the back, acute to blunt and often erose apically, at maturity usually tawny or silvery, the midportion purple or purple-tinged, the broad membranous margins glistening, the first glume (2) 3–5 (6) mm long, 1-nerved, averaging shorter than the upper floret, the second (2.5) 3–5.5 (7) mm long, obscurely 3-nerved, occasionally exceeding the upper floret; lemma thin, smooth and shiny, 1.7–4.5 mm long, pale to more often purple in a band below the tawny margin, truncate to blunt and erose to 4-toothed apically, the awn arising at or below midlength, 1–5 (6) mm long, straight or twisted and occasionally geniculate; callus with short hairs; anthers 1.2–2.5 (3) mm long; $2n = 24$ –28, 52. Mesic to wet meadows and occasionally along streams under spruce-fir, lodgepole pine, ponderosa pine, and in forest openings or rarely on open rocky slopes, at (1370) 1525 to 3810 m in all Utah counties except Davis, Tooele, and Washington; circumboreal, south throughout the western U. S. into Mexico; sporadic eastward; Eurasia; Africa; introduced in Argentina; 294 (xiii). According to Voss (*Rhodora* 68: 440. 1966), alteration of the spelling of the epithet *cespitosa*, as originally published by Linnaeus (*Sp. Pl.* 64. 1753), is unjustified. Tufted hairgrass is a good and often abundant source of forage throughout its growing season. Although it is typically associated with mesic meadows, Thornburg (1982) reports that the U. S. Forest Service has had success with ecotypes adapted to dry, windblown, disturbed sites at high elevations.

***Deschampsia danthonioides* (Trin.) Munro ex Benth.** Annual Hairgrass. [*Aira danthonioides* Trin.]. Annual; culms solitary or tufted, 0.5–7 (8) dm tall; leaves few, chiefly basal; sheaths glabrous; blades to 1.5 mm wide, usually involute; ligule (1) 3–6 mm long; panicle sublinear to open, occasionally reduced to a raceme, erect, 0.3–2.5 dm long, pale green to purple, becoming tawny, the branches erect to ultimately spreading, usually naked below; spikelets 2 (3) -flowered, 4–8 mm long, the

rachilla densely hairy; glumes generally equal or nearly so, lanceolate, (4) 5–8 mm long, exceeding the upper floret, gradually tapered to a sharply acute apex, more or less obscurely 3-nerved, occasionally purple-tinged; lemma at maturity relatively firm, smooth and shiny, 1.8–3 mm long, often purple-tinged, truncate and more or less unequally 4-toothed apically, the awn arising at or below midlength, 3–7 mm long, geniculate; callus bearded with hairs less than half as long as the lemma; anthers 0.3–0.5 mm long; $2n = 26$. Salt desert shrub and saline meadow communities, pastures and marshes below 1525 m in Cache, Davis, Salt Lake, and Weber counties; Alaska to Alberta, south throughout most of the western U. S. and in Mexico; 18 (v).

***Deschampsia elongata* (Hook.) Munro ex Benth.** Slender Hairgrass. [*Aira elongata* Hook.]. Perennial; culms slender, erect, densely tufted, 1–10 (12) dm tall; leaves chiefly basal and short relative to the culm; sheaths usually glabrous; blades soft but ascending, flat to involute-filiform, 0.5–1.5 mm wide, glabrous or scaberulous; ligule 2.5–8 (9) mm long; panicle typically sublinear, 0.5–3 dm long, mostly erect, green, becoming tawny, occasionally purple-tinged or purple, the branches erect-appressed or rarely slightly spreading, the naked portion of the branches usually appressed to the rachis and inconspicuous; spikelets 2 (3) -flowered, mostly 4–7 mm long, somewhat flattened to subterete, the rachilla sparsely hairy; glumes equal or nearly so, lanceolate, mostly 4–7 mm long, exceeding the upper floret, gradually tapered to a sharply acute apex, obscurely to conspicuously 3-nerved; lemma relatively firm, smooth and shiny, 1.5–3 mm long, occasionally purple to some degree, truncate and unequally 4-toothed at the apex, the awn arising just below the midlength, 1.5–6 mm long, nearly straight; callus bearded with hairs often at least half as long as the lemma; anthers 0.2–0.7 mm long; $2n = 26$. Dry to moist sites, streamside and in maple, aspen, spruce-fir, lodgepole pine, and meadow communities, occasionally on open slopes and rocky ridges, at 1830 to 3140 m in Box Elder, Cache, Davis, Duchesne, Juab, Morgan, Rich, Salt Lake, Summit, Utah, and Wasatch counties; Alaska to Alberta, south throughout most of the western U. S. and into Mexico; Argentina; 76 (xii).

Digitaria Heister

Annuals or perennials; culms erect to prostrate; sheaths open; blades flat; ligule membranous; inflorescence a panicle of 2–20 slender, spikelike, secund branches, these simple or rarely branched near the base, whorled or occasionally distributed along a short axis, the spikelets arising from one side of a somewhat 3-angled winged rachis, usually 2 or 3 per node, borne on appressed pedicels of different lengths, the lower pedicel very short, the second ca 0.8–4 mm long, the third (when present) slightly longer, often fused with the rachis in the upper part; spikelets dorsiventrally compressed, disarticulating below the glumes, 2-flowered, the lower floret reduced to an empty lemma, the upper floret perfect; glumes unequal, the first minute or lacking, the second ranging from much shorter to fully as long as the lemma, conspicuously 3- to 7-nerved; sterile lemma similar to the second glume in texture and nervation, but nearly to fully as long as the fertile lemma; fertile lemma leathery and more or less glossy, dorsiventrally compressed, acute to acuminate at the apex, the membranous margins curved around

the palea; palea similar to the fertile lemma in texture; stamens 3; caryopsis free of but firmly enclosed within the lemma and palea, the embryo $2/5-1/2$ the length of the grain; $x = 9$.

1. First glume triangular, often minute but opaque and readily visible under low magnification; second glume narrower and distinctly shorter than the spikelet; herbage pubescent with spreading, often papilla-based hairs *D. sanguinalis*
- First glume transparent and obscure or lacking; second glume about as long as the spikelet; herbage glabrous or inconspicuously hairy, occasionally with longer hairs near the ligule *D. ischaemum*

***Digitaria ischaemum* (Schreber) Schreber ex Muhl.**

Smooth Crabgrass. [*Panicum ischaemum* Schreber in Schweigger]. Annual; culms 1–4 dm long, erect or decumbent to prostrate; sheaths usually long-hairy near the ligule, otherwise glabrous or the lower ones inconspicuously hairy; blades flat, 2–4.5 (6) mm wide, glabrous or scabrous; ligule 1–2 mm long; panicle of 2–6 spikelike branches 3–10 (11) cm long in a terminal whorl, occasionally with 1 or 2 branches below the terminal ones, the rachis flat or nearly so and rather broadly winged; spikelets borne in groups of 3 or some of them in pairs, elliptical, 1.7–2.5 mm long and to ca 1 mm wide, often purple or purple-tinged; first glume lacking or present as a minute transparent scale, the second thin and often pale, lanceolate to ovate, equal to or not less than $4/5$ as long as the spikelet, rounded on the back, prominently 3–nerved, minutely crisp-hairy, the hairs typically enlarged apically (30x magnification); sterile lemma relatively firm and often purple, essentially flat, equal to or slightly shorter than the fertile lemma, prominently 5– to 7–nerved, minutely crisp-hairy; fertile lemma leathery, at maturity dark brown to purple black, glossy and finely striate; anthers 0.5–0.7 mm long; $2n = 36, 45$. Weed of lawns below 1525 m in Cache, Salt Lake, and Utah counties; native to Eurasia, widely distributed in southern Canada and through most of the U. S.; 9 (i).

***Digitaria sanguinalis* (L.) Scop.** Hairy Crabgrass. [*Panicum sanguinale* L.; *Syntherisma sanguinalis* (L.) Dulac]. Annual; culms 2–10 dm tall, erect or ascending to prostrate, often rooting at the lowermost nodes and mat-forming; sheaths conspicuously pubescent with spreading, often papilla-based hairs mostly 1–3 mm long; blades flat, 2.5–12 mm wide, scabrous or sparsely long-hairy, the hairs usually papilla-based; ligule mostly 0.5–2.5 mm long; panicle of 2–16 branches 3–20 cm long in 1–3 whorls, occasionally some of the branches solitary, the rachis 3–angled, each angle narrowly winged; spikelets borne in pairs, narrowly lanceolate to elliptical, 2.2–3.5 mm long and to ca 1 mm wide, often purple or purple-tinged; first glume triangular, 0.1–0.5 mm long, firm or at least opaque (easily seen at low magnification), the second glume narrowly wedge-shaped, typically pale, 0.8–2.5 mm long, $1/3-3/5$ the length of the spikelet, 3–nerved, ciliate to densely puberulent throughout; sterile lemma often purple, essentially flat, equal to the fertile lemma or nearly so, prominently 5– to 7–nerved, the lateral nerves closely spaced near the incurved ciliate margin and scabrous to pubescent with appressed or spreading hairs; fertile lemma leathery, at maturity pale to dark gray, glossy and finely striate; anthers 0.5–0.8 mm long; $2n = 18, 28, 36-48, 76$. Weed of lawns, gardens, and waste

places below 1525 m in Box Elder, Cache, Duchesne, Kane, Salt Lake, Utah, Washington, and Weber counties; native to Eurasia, introduced in southern Canada, south throughout the U. S.; Mexico; South America; 29 (ii). *Digitaria adscendens* (H.B.K.) Henrard, reported from Washington County by Ebinger (Brittonia 14: 248–253, 1962), is synonymous with *D. ciliaris* (Retz.) Koeler (Gould 1975), a Eurasian species very closely related to *D. sanguinalis*. As described by Gould, the taxon differs from *D. sanguinalis* chiefly in having essentially glabrous leaves and the lateral nerves of the sterile lemma smooth rather than scaberulous. I have seen no Utah plants in which these characters are correlated.

***Distichlis* Raf.**

Dioecious (rarely monoecious) perennials; leaves chiefly cauline; sheaths open; blades firm; ligule membranous; inflorescence a compact panicle or raceme; spikelets laterally compressed, few– to many-flowered, disarticulating above the glumes and between the florets; glumes equal or unequal, keeled, the first 3– to 5–nerved, the second 5– to 7 (9) –nerved, the nerves sometimes obscure; lemma broad, 7– to 13–nerved, keeled, those of the pistillate spikelets leathery; palea subequal to the lemma in length and width; stamens 3; caryopsis free within but enclosed by the lemma and palea, the embryo less than $1/2$ as long as the grain; $x = 10$.

Beetle, A. A. 1943. The North American variations of *Distichlis spicata*. Bull. Torrey Bot. Club 70: 638–650.
Reeder, J. R. 1943. The status of *Distichlis dentata*. Bull. Torrey Bot. Club 70: 53–56.

***Distichlis spicata* (L.) Greene** Desert Saltgrass. [*Uniola spicata* L.; *D. dentata* Rydb.; *D. stricta* (Forr.) Rydb.; *D. spicata* var. *stricta* (Torr.) Scribn.; *D. maritima* var. *laxa* H. T. Holm, type from Lake Park, Uintah Co.]. Dioecious, strongly rhizomatous or sometimes stoloniferous perennial; culms leafy, 1–4 (5) dm tall, stiffly erect from a more or less decumbent base; sheaths short, glabrous or with hairs at the summit 0.5–3 mm long; blades of the middle and upper culm leaves conspicuously 2-ranked, stiffly ascending-spreading, 1–4 mm wide, loosely involute on drying, long-tapered to a sharply acute tip, glabrous or the upper surface scaberulous to long-hairy; blades near the culm base typically scalelike; ligule a ciliate membrane 0.2–0.6 mm long; panicle (raceme) mostly narrowly oblong, compact, 2–9 cm long, those of mature staminate plants usually exerted above the leaves, those of pistillate plants usually equal to or shorter than the blades; spikelets mostly strongly laterally compressed, 5– to 16 (20) –flowered, 6–22 (25) mm long, glabrous, light green and occasionally purple-tinged; glumes ovate to lanceolate, equal or unequal, keeled, 3– to 9–nerved, sometimes obscurely so, glabrous throughout or obscurely scabrous on the keel, the first glume (1.5) 2–6 (7.8) mm long, the second 2.5–8.5 mm long; lemma ovate to lanceolate, keeled to more or less rounded on the back, 7– to 13–nerved, sometimes obscurely so, glabrous, membranous-margined, the abruptly to sharply acute tips often incurved; lemmas of pistillate florets 3–10 mm long, those of staminate florets mostly 3–7 mm long; palea about equal to the lemma; anthers 2–4 mm long; $2n = 38, 40, 42, 72$. Moist sites in salt desert shrub communities and occasionally around seeps and springs in sage-

brush, oak, and pinyon-juniper communities, sometimes invading cultivated areas as a weed, at 1010 to 2290 m in all Utah counties except Morgan, Summit, and Wasatch; British Columbia to Manitoba, south throughout the western and central U. S. into Mexico, and along the Atlantic Coast and the Gulf of Mexico; South America; 177 (vii). This species is commonly considered to consist of two varieties with plants distributed along the Atlantic and Pacific coastal regions and Gulf of Mexico being referred to var. *spicata*, and inland plants to var. *stricta*. Authors do not agree, however, as to how the two varieties differ. According to Beetle (1943), who recognized a number of infraspecific taxa, var. *stricta* in various parts of its range "approaches in certain characters all other varieties and even typical material from the eastern seaboard." Finding no correlation between morphological variation and geographical distribution, I choose to treat the complex as a single taxonomic unit. Desert saltgrass is not exceptionally palatable but, in areas of saline soil, is often grazed for lack of other forage. Because of its rhizomatous nature, saltgrass provides excellent protection against erosion by wind and water. Seed is not usually available commercially, however, because of low seed production by the plant.

Echinochloa Beauv.

Annuals or perennials; sheaths open; ligule a ring of hairs or lacking; inflorescence a panicle of simple or rebranched, densely flowered, secund branches with spikelets sessile in clusters or in regular rows; spikelets dorsiventrally compressed, disarticulating below the glumes, 2-flowered, the lower floret staminate or neuter, the upper one perfect; glumes membranous, unequal, the first clasping the base of the spikelet, the second acute to awned at the apex; lemma of the lower floret similar to the second glume in size, shape, and texture, both structures closely sheathing the upper floret; lemma of the perfect floret plano-convex, firm, smooth and glossy, the firm margins incurved around the equally firm palea; stamens 3; caryopsis free of but firmly enclosed within the lemma and palea, broadly ellipsoidal to spherical, the embryo $2/3$ – $3/4$ the length of the grain; $x = 9$.

Gould, F. W., M. A. Ali, and D. E. Fairbrothers. 1972. A revision of *Echinochloa* in the United States. Amer. Midl. Naturalist 87: 36–59.

Echinochloa crus-galli (L.) Beauv. Barnyard Grass. [*Panicum crus-galli* L.; *E. muricata* var. *microstachya* Wieg.; *E. crus-galli* var. *zelayensis* (H.B.K.) A. S. Hitchc.]. Coarse annual; culms solitary or in small tufts, erect to ascending, 1–10 (18) dm tall, sheaths glabrous or occasionally with a few long hairs near the collar; blades elongate, flat, 3–30 mm wide, glabrous or scabrous to sparsely long-hairy; ligule lacking; panicle narrowly elongate, 0.5–2.5 dm long, erect to nodding, the branches densely flowered, erect-ascending to widely spreading, occasionally the longer ones rebranched; spikelets plano-convex, 2.8–4 mm long; glumes unequal, the first 1.2–1.6 mm long, sometimes awn-tipped, the second as long as the spikelet, usually coarsely stiff-hairy on the crowded lateral nerves and variously scabrous to puberulent over the back, rarely subglabrous, acute to short-awned; lemma of the lower floret similar to the second glume but occasionally with an awn 0.5–5 cm long; lemma of the upper floret leathery or hardened, broadly

elliptical, rounded on the back, smooth and glossy, unawned or awn-tipped; anthers 0.4–1.2 mm long. Weed of gardens, fields, and other open sites, especially along waterways, at 820 to 2135 m in Beaver, Box Elder, Cache, Carbon, Davis, Emery, Garfield, Grand, Iron, Juab, Kane, Millard, Salt Lake, San Juan, Sanpete, Tooele, Uintah, Utah, Washington, Wasatch, Wayne, and Weber counties; southern Canada, south through most of the U. S. and in Mexico; South America; Eurasia; 100 (v). Polymorphism in *E. crus-galli* has led to the segregation of varieties, but the existence of morphological intermediates and the lack of geographical or ecological disjunction among the proposed taxa suggest that they do not merit taxonomic recognition (Cronquist et al. 1977). Several species of *Echinochloa* are cultivated as food and fodder plants in Asia and Africa.

Eleusine Gaertner

Annuals or perennials; culms more or less compressed; sheaths open; blades flat to loosely involute; ligule membranous; inflorescence of 1 to several, spike-like, digitately arranged branches, often with 1 or 2 branches below the terminal whorl, the spikelets sessile in 2 closely overlapping rows along one side of a flattened rachis, the rachis not prolonged beyond the terminal spikelet, the latter scarcely if at all reduced; spikelets strongly laterally compressed, mostly 2- to 10-flowered, disarticulating above the glumes and between the florets; glumes keeled, unequal, the first mostly 1-nerved, the second 3- to 7-nerved, shorter than or equal to the lowermost lemma; lemma keeled, 3 (5) -nerved; palea shorter than the lemma; stamens 3; caryopsis free of the lemma and palea, at maturity loosely enclosed by or free of the pale membranous pericarp, 3-angled, horizontally striate, the embryo about half the length of the grain; $x = 9$.

Eleusine indica (L.) Gaertner Goosegrass. [*Cynosurus indicus* L.]. Annual; culms typically much branched from the base, ascending to prostrate, 0.5–3 (8) dm long; sheaths often keeled, glabrous or pubescent near the summit with hairs 2–6 mm long; blades flat to loosely involute, 1–8 mm wide, usually glabrous; ligule 0.3–1.2 mm long, ciliate, the membranous portion longer than the cilia; panicle of (1) 2–6 (12) spike-like branches digitately or racemously arranged, 3–10 (15) cm long and mostly 3–6 mm wide, the sessile spikelets closely appressed to one side of a flattened rachis, the latter ca 1 mm wide; spikelets strongly flattened, elliptical, 3- to 9-flowered, ovate to lanceolate-elliptical, 5–8 mm long; glumes firm, lanceolate, keeled, acute, the first 2–3 mm long, 1 (2) -nerved, the second 2.7–4 mm long, 3- to 7-nerved, shorter than or equal to the lowermost lemma; lemma membranous except near the midrib, keeled, lanceolate, 2.5–4 mm long, (3) 5- to 7-nerved, abruptly acute to mucronate at the apex, glabrous; anthers 0.3–0.7 mm long; $2n = 18, 36$. Weed, chiefly of lawns, below 1525 m in Cache, Salt Lake, and Washington counties; native to the tropics of Eurasia, adventive in Canada and established through much of the U. S. and Mexico; South America; 7 (ii). Utah material has sometimes been interpreted as *E. tristachya* (Lam.) Lam., but that taxon differs from *E. indica* in having spike-like branches no more than 2.5 cm long and lemmas at least 4.2 mm long (Tsvelev 1984).

Elymus L.

Perennials, strongly rhizomatous to densely tufted; sheaths open, with or without auricles; blades flat to involute; ligule membranous; inflorescence a terminal, solitary (rarely compound) spike, the rachis continuous or in a few species readily disarticulating; spikelets 1–8 or more per node, sessile, usually more or less overlapping, at least near midlength of the spike, subterete to laterally flattened, 2– to 11-flowered, the rachilla disarticulating above the glumes and between the florets or, in a few species, below the glumes; occasionally some of the spikelets, especially those near the base of the spike, reduced to 1 or 2 glumes; glumes subequal to unequal, awnlike throughout to subulate or elliptical, occasionally asymmetrical, 0– to 5 (6) –nerved, acute to truncate, awned or awnless, shorter to longer than the lowermost lemma; lemma lanceolate, either the rounded back or the sides visible between the glumes (often variable within a species) (3) 5– to 7-nerved, the nerves often visible only near the apex, awned or awnless; palea well developed; stamens 3; caryopsis adherent to the palea and often to the lemma, ellipsoidal, the embryo 1/6–1/2 as long as the grain; $x = 7$. See discussion of the tribe Triticeae under *Agropyron*. Species of *Elymus* (especially *E. cinereus*, *E. canadensis*, and *E. virginicus*) are subject to infestation with the parasitic fungus *Claviceps purpurea* (Fr.) Tul., commonly known as ergot. Consumption by animals of grasses so infested can cause serious injury or even death if consumed in sufficient quantity (Kingsbury 1964).

Note: A plant that cannot be identified using the key below may be a hybrid; see guide to hybrids, p. 722.

- 1. Rachis readily disarticulating 2
- Rachis continuous 4
- 2(1). Lemmas acute or with an awn to 3 mm long; glumes subulate, acute to awn-tipped; spikelets (2) 3 per node; anthers 3–5 mm long *E. junceus*
- Lemma awns mostly 10–85 mm long; glumes awnlike throughout or awned at the apex; spikelets 1 or 2 per node; anthers 1–2 mm long 3
- 3(2). Glumes awnlike throughout or only slightly expanded near the base, mostly 1- or 2-nerved, 20–85 mm long; spikelets 2 per node; plants general in distribution *E. elymoides*

- Glumes linear to narrowly lanceolate, 1- to 5-nerved, with an awn (4) 8–30 mm long; spikelets 1 (2) per node; plants mostly above 2740 m ... *E. scribneri*
- 4(1). Glumes subulate to narrowly lanceolate, 0- to 1 (3) –nerved, usually obscurely so (the nerves not raised), acute or with an awn to ca 3 mm long 5
- Glumes variously shaped, conspicuously 2- to 7-nerved (the nerves raised), truncate to acute, awnless or with an awn to 20 mm long 9
- 5(4). Spikelets (2) 3–7 at each node of the rachis; glumes (when flattened) to ca 0.5 mm wide near the base 6
- Spikelets 1 or 2 per node, rarely 3 at a few nodes; glumes (when flattened) often more than 0.5 (0.3–1.5) mm wide near the base 7
- 6(5). Ligules of lower culm leaves averaging more than 1.5 (1–7) mm long; blades 3–20 mm wide; spikelets mostly 3- to 7-flowered; glumes 5–20 mm long, often more than 3/4 the length of the lower lemma; old sheath bases papery, not disintegrating into fibers *E. cinereus*
- Ligules of lower culm leaves averaging less than 1.5 (0.2–1.5) mm long; blades 1–5 mm wide; spikelets 2 (3) –flowered; glumes not more than 9 mm long, mostly less than 3/4 the length of the lower lemma; old sheath bases fibrillose *E. junceus*
- 7(5). Plants strongly tufted, occasionally rhizomatous, mostly of mountain sides and plateaus, rarely in low-lying alkaline sites; spikelets 1 per node or occasionally 2 at some or all nodes; leaf blades to 4 mm wide; sheaths nearly always glabrous *E. salinus*
- Plants strongly rhizomatous, mostly of low-lying, often alkaline sites; spikelets (1) 2 per node; blades 1–10 mm wide; sheaths glabrous or pubescent 8
- 8(7). Lemmas gradually tapered to an awn 2–7 mm long; sheaths glabrous; plants known from Daggett County *E. simplex*
- Lemmas acute to abruptly awn-tipped or with an awn to 3 mm long, typically shiny and darkened toward the base; sheaths usually hairy (sometimes only minutely so) along the margins; plants widespread *E. triticoides*
- 9(4). Spikelets 1 per node or occasionally 2 at some nodes 10
- Spikelets usually 2 at most nodes, rarely 3 or 4 at some nodes 17
- 10(9). Glumes truncate or obtuse to abruptly acute or coarsely mucronate, (1.6) 2–3 mm wide, thickened and indurate, glabrous or hairy; sheaths typically ciliate on at least one margin 11
- Glumes acute to awned, rarely obtuse, diverse in width but not thickened and indurate; sheaths rarely ciliate 12
- 11(10). Plants with rhizomes *E. hispidus*
- Plants densely tufted *E. elongatus*
- 12(10). Glumes with an awn mostly 8–30 mm long; culms rarely as much as 4 dm tall, often decumbent to curved-ascending, plants mostly above 2740 m *E. scribneri*
- Glumes awnless or with an awn to 5 mm long; culms 3–15 dm tall and erect; plants general in distribution 13
- 13(12). Anthers 0.6–2.2 mm long (usually retained in many of the spikelets even in age); spikelets at midlength of the spike about twice as long as the internodes of the rachis; glumes conspicuously (3) 5- to 9-nerved, the second at least 2/3 as long as the lowermost lemma *E. trachycaulus*

- Anthers (2.5) 3–7 mm long (usually falling after flowering); spikelets at midlength of the spike variable; glumes diverse 14
- 14(13). Plants densely tufted, rarely with short rhizomes; spikelets at midlength of the spike not exceeding the internodes of the rachis by more than 1/3 their length; lemmas glabrous to scabrous, acute or more often awned, the awn 3–25 mm long and at maturity strongly divergent *E. spicatus*
- Plants strongly rhizomatous; spikelets at midlength of the spike variable; lemmas glabrous to puberulent, awnless or with a mostly straight awn to 15 mm long 15
- 15(14). Leaf blades flat, (2) 5–15 mm wide, mostly dark green; anthers (3) 4–7 mm long *E. repens*
- Leaf blades either involute or mostly less than 5 mm wide, typically glaucous; anthers (2.5) 3–5 mm long 16
- 16(15). Glumes broadest at or above midlength, abruptly acute or awn-tipped, the body of the first glume mostly 2–6 mm shorter than the adjoining lemma *E. lanceolatus*
- Glumes broadest below midlength, gradually tapered from near the base and passing imperceptibly into an awn-tip, the whole typically as long as to longer than the body of the lowermost lemma *E. smithii*
- 17(9). Spikelets disarticulating below the glumes; glumes subterete at the base, the basal portion nerveless and hardened, usually curved outward; plants rare, reported only from north-central Utah *E. virginicus*
- Spikelets disarticulating above the glumes; glumes not both subterete and bowed outward at the base; plants general in distribution 18
- 18(17). Plants strongly rhizomatous, typically glaucous; glumes gradually long-tapered from below midlength to a sharply acute or awn-tipped apex; leaf blades 1–3 (5) mm wide *E. smithii*
- Plants tufted, yellow green to glaucous; glumes broadest at or above midlength, acute to long-awned; leaf blades (3) 4–20 mm wide 19
- 19(18). Glumes with awns averaging more than 5 (4–20) mm long; lemmas short-hairy or rarely merely scabrous, the awns mostly 10–40 mm long, ultimately spreading; spikes usually flexuous to nodding .. *E. canadensis*
- Glumes awnless or the awns averaging no more than 5 (1–5) mm long; lemmas glabrous to minutely scabrous, the awns 1–30 mm long, usually erect; spikes stiffly erect *E. glaucus*
- Note: Extensive hybridization and introgression among species in the tribe Triticeae help to explain the occurrence of anomalous plants that cannot be identified using the foregoing key. Some frequently recurring hybrids were originally mistaken for species and given names accordingly, e.g., *Agropyron pseudorepens* Scribn. & Sm., *A. saundersii* (Vasey) A. S. Hitchc., *A. saxicola* (Scribn. & Sm.) Piper, *Elymus macounii* Vasey, and *Sitanion hanssenii* (Scribn.) J. G. Sm. Current names for these plants are given in the following guide to some of the more common hybrids of the tribe Triticeae:
1. Internodes of the rachis averaging no more than 3 mm long; glumes unawned 2
- Internodes of the rachis averaging more than 3 mm long or, if shorter, the glumes awned 3
- 2(1). Anthers more than 2.5 mm long; plants often rhizomatous *Agropyron cristatum* x *Elymus repens*
- Anthers to 2 mm long; plants tufted *Agropyron cristatum* x *Elymus trachycaulus*
- 3(1). Glumes awnless or merely awn-tipped; rachis continuous 4
- Glumes with awns at least 3 mm long; rachis continuous or disarticulating 12
- 4(3). Spikelets 2 or more at some or all nodes; plants with or without rhizomes 5
- Spikelets solitary at each node; plants often shortly rhizomatous 7
- 5(4). Glumes elliptical to lanceolate, (2) 3- to 9-nerved; lemmas awned; plants tufted; anthers not usually more than 2 mm long *Elymus glaucus* x *E. trachycaulus*
- Glumes narrowly lanceolate to subulate, 1 (2) -nerved; lemmas unawned or awn-tipped; plants tufted or rhizomatous; anthers more than 2 mm long 6
- 6(5). Plants sometimes rhizomatous; lemmas typically brownish *Elymus triticoides* x *E. salinus*
- Plants tufted; lemmas green *Elymus salinus* x *E. cinereus*
- 7(4). Glumes mostly subulate, 1-nerved; anthers more than 2 mm long *Elymus salinus* x *E. lanceolatus*
- Glumes broader, 2- to 9-nerved; anthers often no more than 2 mm long 8
- 8(7). Spikelets at midlength of the rachis (at least some) less than twice as long as the internodes; anthers more than 2 mm long; lemmas awn-tipped or with a divergent awn to 15 mm long *Elymus spicatus* x *E. lanceolatus*
- Spikelets at midlength of the rachis usually at least twice the length of the internodes; anthers at maturity often less than 2 mm long; lemmas unawned or awned 9
- 9(8). Plants of subalpine to alpine *Elymus trachycaulus* x *E. scribneri*
- Plants mostly at lower elevations 10
- 10(9). Leaves often more than 5 mm wide; internodes of the rachis short throughout the spike *Elymus trachycaulus* x *E. repens*
- Leaves no more than 5 mm wide; internodes of the rachis variable in length 11
- 11(10). Plants rhizomatous, often glaucous *Elymus trachycaulus* x *E. lanceolatus* [*E. x pseudorepens* (Scribn. & Sm.) Barkworth & D. R. Dewey]
- Plants lacking rhizomes, mostly yellow green *Elymus trachycaulus* x *Agropyron cristatum*
- 12(3). Internodes of the rachis (2) 3–4 mm long throughout the length of the spike or nearly so; glumes variable in width from awnlike throughout to basally expanded, scaberulous throughout their length *Elymus trachycaulus* x *Hordeum jubatum* [*Elyhordeum macounii* (Vasey) Barkworth & D. R. Dewey]
- Internodes of the rachis generally more than 4 mm long at most of the nodes; glumes variable as to width, not finely scaberulous throughout 13
- 13(12). Spikelets mostly 2 or more per node; plants with or without rhizomes 14
- Spikelets mostly solitary at each node; plants lacking rhizomes 17
- 14(13). Glumes 2- to 4-nerved at the base; lemmas green, with awns mostly at least 3 cm long *Elymus elymoides* x *E. glaucus* [*E. x hanssenii* Scribn.]

- Glumes mostly 1-nerved or nerveless; awn of lemma less than 3 cm long 15
- 15(14). Lemmas brownish and smooth; plants often rhizomatous *Elymus triticoides* x *E. elymoides*
- Lemmas green and glabrous to minutely hairy; plants not rhizomatous 16
- 16(15). Lemmas minutely hairy; leaf blades (some of them) more than 4 mm wide; spikelets generally more than 2 at some of the nodes ... *Elymus cinereus* x *E. elymoides*
- Lemmas glabrous; leaf blades narrow and often involute; spikelets 2 per node *Elymus salinus* x *E. elymoides*
- 17(13). Glumes awnlike throughout their length or nearly so, mostly nerveless or 1-nerved; rachis usually disarticulating *Elymus salinus* x *E. elymoides*
- Glumes mostly at least 1 mm wide near the base, (2) 3- to 7-nerved, rachis diverse 18
- 18(17). Rachis continuous; glumes consistently 3- to 7-nerved 19
- Rachis often disarticulating; glumes occasionally less than 3-nerved 20
- 19(18). Glumes with awns to 4 mm long; lemmas mostly glabrous to scabrous, the awns straight; spikes erect *Elymus glaucus* x *E. trachycaulus*
- Glumes with awns more than 4 mm long; lemmas often short-hairy, the awns recurved; spikes sometimes flexuous to nodding *Elymus canadensis* x *E. trachycaulus*
- 20(18). Anthers (or some of them) more than 2 mm long; internodes at midlength of the rachis often more than half the length of the spikelets; awns of the lemmas often recurved *Elymus spicatus* x *E. elymoides*
[*E. x saxicolus* Scribn. & Sm.]
- Anthers to 2 mm long; internodes at midlength of the rachis not more than half the length of the spikelets; awns of the lemma divergent but not recurved 21
- 21(20). Culms often decumbent; spikelets 1 per node; rachis internodes averaging 4 mm or less; plants of high elevations *Elymus scribneri* x *E. trachycaulus*
- Culms erect; spikelets sometimes 2 at a few nodes; rachis internodes diverse; plants of valleys to alpine *Elymus trachycaulus* x *E. elymoides*
[*E. x saundersii* Vasey]

Elymus canadensis L. Canada Wildrye. Perennial; culms tufted, 8–20 (28) dm tall, erect or decumbent at the base; leaves chiefly cauline; sheaths glabrous or sometimes long-hairy, usually with well-developed auricles; blades flat or folded, (3) 4–15 (20) mm wide, glabrous or scaberulous to scabrous, rarely pubescent; ligule 0.2–1.5 (2) mm long; spike 7–20 (25) cm long, usually nodding, the rachis continuous, the internodes at midlength mostly (4) 5–8 mm long; spikelets 2–4 per node, (2) 3- to 5-flowered, mostly 10–18 mm long; glumes narrowly elliptical, mostly 0.6–1.3 mm wide at the widest point, conspicuously (2) 3- to 5-nerved, narrowed below and tapered to an awn at the apex, the body 6–15 mm long, the awn 4–20 mm long, mostly spreading, the whole usually exceeding the spikelet; lemma with the rounded back visible between the glumes, mostly 8–15 mm long, glabrous or more often scabrous to short-hairy, 5- to 7-nerved, tapered to an ultimately spreading awn 10–40 (50) mm long; anthers 2.5–4 mm long; $2n = 28, 42$. Along waterways and in wet, sometimes saline meadows at 1220

to 2440 m in Box Elder, Cache, Carbon, Daggett, Emery, Garfield, Grand, Iron, Juab, Kane, Millard, Piute, Salt Lake, San Juan, Sanpete, Sevier, Uintah, Utah, Wasatch, Washington, and Wayne counties; British Columbia to Nova Scotia, south through the U. S except in the extreme Southeast; adventive in Eurasia; 104 (iv). *Elymus canadensis* hybridizes with *E. trachycaulus* (see guide to hybrids p. 722).

Elymus cinereus Scribn. & Merr. Great Basin Wildrye. [*E. condensatus* authors, not Presl; *Leymus cinereus* (Scribn. & Merr.) Love]. Robust perennial, often with short rhizomes; culms mostly 7–25 dm tall, densely tufted, often forming clumps to 1 m or more in diameter; herbage bright green to strongly glaucous; sheaths glabrous or pubescent, often with well-developed auricles, old sheath bases papery, breaking off, not disintegrating into fibers; blades flat or nearly so, (1) 3–15 (20) mm wide, glabrous or scabrous to pubescent; ligule of lower culm leaves 1.5–7 mm long; spike stiffly erect, 7–25 (29) cm long and to 20 mm wide, rarely branching or a few spikelets short-pedicelled, the rachis continuous, often hairy, especially on the angles, the internodes at midlength of spike mostly (3) 4–7 mm long; spikelets (2) 3–6 (7) per node, disarticulating above or below the glumes, 9–20 mm long (excluding awns), mostly 3- to 6 (7)-flowered; glumes subulate to narrowly lanceolate, to ca 0.5 mm wide near the base and tapered to an awnlike tip, the whole 5–14 (20) mm long, shorter to longer than the lowermost lemma, 1 (3)-nerved, often obscurely so, glabrous or scaberulous; lemma rounded on the back, the back or occasionally the sides visible between the glumes, (6.5) 7–13 (15) mm long, glabrous or more often scaberulous to short-hairy, 5- to 7-nerved, acute to awn-tipped or with an awn to 5 (7) mm long; anthers 3–7 mm long; $2n = 28, 42, 56$. Moist to ultimately dry sites along waterways and roadsides, on open grassy slopes, in wet meadows, and in openings in sagebrush, juniper, pinyon-juniper, mountain brush, aspen, spruce-fir, ponderosa pine, and lodgepole pine communities at 790 to 2900 m in all Utah counties except Emery, Kane, Morgan, and Wayne; throughout the western U. S., rare in the Great Plains; 137 (iv). This species forms natural hybrids with *E. elymoides* and *E. triticoides* (see guide to hybrids p. 722). Great Basin wildrye is a moderately palatable, long-lived species valuable for range seeding and erosion control, especially in alkaline-saline soils.

Elymus elongatus (Host) Runem. Tall Wheatgrass. [*Triticum elongatum* Host; *Agropyron elongatum* (Host) Beauv.; *Elytrigia elongata* (Host) Nevski; *E. pontica* (Podp.) Holub; *Thinopyrum elongatum* (Host) D. Dewey; *T. ponticum* (Podp.) Barkworth & D. Dewey]. Perennial; herbage green or glaucous; culms densely tufted, erect, 5–20 dm tall; sheaths typically ciliate on at least one margin, otherwise glabrous, the auricles often well developed; blades flat to involute, 2–8 mm wide, glabrous or more often at least the upper surface scabrous or pubescent with short stiff hairs, often minutely hairy near the ligule; ligule to ca 0.7 mm long; spike erect to lax, 8–40 cm long, the rachis continuous, the internodes mostly 7–20 mm long at midlength of the spike; spikelets solitary at each node, at maturity compressed, 13–35 (40) mm long, 5- to 18-flowered, glabrous or hairy; glumes thickened and hardened, oblong, conspicuously 5- to 7 (9)-nerved, 6–11 mm long and (1.5) 2–3 mm wide, rounded on the back, truncate or occasionally slightly

mucronate apically; lemma thickened and hardened, oblong to lanceolate, (8) 9–13 mm long, the sides visible between the glumes, 5–nerved, truncate to acutish at the apex, typically glabrous; anthers 4–7 mm long; $2n = 14, 28, 42, 56, 70$. Along roadways and in salt desert shrub, sagebrush, aspen, and lower montane grassland communities, rarely under spruce-fir, at 1220 to 2740 m in Box Elder, Cache, Carbon, Daggett, Davis, Duchesne, Garfield, Juab, Kane, Millard, Salt Lake, Sanpete, Sevier, Summit, Tooele, Utah, Wasatch, Washington, Wayne, and Weber counties; native to Eurasia, introduced in the U. S. through much of the West, and in the central states as far south as Kansas and Iowa; South America; 54 (xi). Tall wheatgrass was first introduced in Utah in the 1930s. It is especially useful for seeding wet or subirrigated alkaline-saline soils, and for open foothill sites where it requires more than 30 cm mean annual precipitation. The grass is an excellent source of forage and cures well when left standing, thus providing a source of winter forage. Some animals find it unpalatable, however, because of its coarseness (Valentine 1961).

Elymus elymoides (Raf.) Swezey Squirreltail. [*Sitanion elymoides* Raf.; *Aegilops hystrix* Nutt.; *S. hystrix* (Nutt.) J. G. Sm.; *S. breviaristatum* J. G. Sm.; *S. cinereum* J. G. Sm.; *S. insulare* J. G. Sm., type from Carrington Island, Great Salt Lake; *S. longifolium* J. G. Sm.]. Perennial; culms solitary to densely tufted, 0.5–8 dm tall, erect or occasionally spreading; herbage glabrous to long-hairy throughout; sheaths with auricles mostly inconspicuous or lacking; blades flat to involute, 1–4 (6) mm wide; ligule mostly less than 0.5 mm long; spike erect to flexuous or nodding, 2–15 (17) cm long (excluding awns) and at maturity to ca 12 cm or more wide (including awns), the rachis readily disarticulating, the internodes mostly 2–12 mm long at midlength of the spike; spikelets (1) 2 (4) per node, (1) 2– to 6-flowered, mostly loosely overlapping; lowermost floret occasionally reduced to an awn; glumes typically 1– or 2 (3)–nerved, 0.2–1 mm wide near the base, tapering to an ultimately widely spreading, scabrous awn, the whole 2–10 (12) cm long, occasionally some of the glumes cleft into 2 (3) awns of unequal lengths, these occasionally with 1 to several, bristlelike lateral appendages, the awns often becoming purple; lemma lanceolate to elliptical, rounded on the back, the back or sides visible between the glumes, 6–12 mm long, glabrous or scabrous to pubescent, 3– to 5–nerved, the midnerve prolonged into an ultimately recurved, scabrous awn mostly 2–8.5 cm long; anthers 1–2 mm long; $2n = 28$. Dry to moist sites, occurring in every vegetative type from salt desert shrub to alpine grasslands at 1070 to 3500 m, in all Utah counties except Morgan; British Columbia to Saskatchewan, south throughout the western and central U. S. and in Mexico; 424 (x). Bentham and Hooker (*Genera Plantarum* 1883) included *Sitanion* as a section of *Elymus*. Although most workers have followed Hitchcock (1935) in recognizing *Sitanion* as a separate genus, cytological evidence assembled by Dewey (Bot. Gaz. 128: 11–16. 1967) and by Stebbins (1946a), in addition to the ease with which it hybridizes with other species of *Elymus* and findings from genome analysis demonstrate that it is more reasonably grouped with other species of *Elymus*. An occasional plant in our area, with some glumes 3-cleft, has been referred to *E. multisetus* (J. G. Sm.) Jones [*Sitanion jubatum* J. G. Sm.]. Wilson (1963) claims that in general this species is restricted to California, parts

of Nevada, and the three northwestern states. The sporadic occurrence in Utah of such plants may be the result of introgressive hybridization between *E. glaucus* and *E. elymoides*, a phenomenon acknowledged by Wilson (1963). On the other hand, Cronquist et al. (1977) suggest that *E. multisetus* (as *S. jubatum*) is very similar to and probably conspecific with *E. elymoides* (as *S. hystrix*). *Elymus elymoides* readily crosses in nature with other species of *Elymus* and infrequently with those in *Hordeum*. Squirreltail is a native invader of disturbed areas in deserts, valleys, foothills, and mountain grasslands where overgrazing has eliminated more desirable range grasses. Where locally abundant, it produces fair forage during spring and early summer. At maturity the bristlelike awns may cause injury to grazing animals, but new growth after fall rains is highly palatable and remains so after it has dried (Valentine 1961).

Elymus glaucus Buckley Blue Wildrye. Perennial; culms erect, 6–18 dm tall, forming small, mostly loose tufts; herbage glaucous or dark green; leaves chiefly cauline; sheaths glabrous or puberulent to long-hairy, mostly with well-developed auricles; blades lax, flat to loosely involute, (3) 4–19 mm wide, glabrous or scabrous to sparsely long-hairy; ligule 0.3–1.5 mm long; spike stiffly erect, 6–16 (20) cm long (excluding the awns), the rachis continuous, the internodes at midlength of spike mostly 3–8 mm long; spikelets 2 or rarely 3 per node or solitary at upper and lower nodes, 2– to 4-flowered, 10–16 mm long, disarticulating above the glumes; glumes elliptical, conspicuously 3– to 7–nerved, (5) 6–19 mm long and mostly 1–1.5 mm at the widest point, slightly narrowed below, but the pair usually concealing the base of the lowermost floret, gradually or abruptly tapered to an acute or awn-tipped apex, occasionally with an awn 1–5 mm long; lemma rounded on the back, the back or the sides visible between the glumes, 8–15 mm long, glabrous or scabrous to scabrid-puberulent, 5– to 7–nerved, awn-tipped or more often tapered to a straight or occasionally recurved awn mostly 8–30 mm long; anthers 1.5–3 mm long; $2n = 28$. Mountain brush, aspen, ponderosa pine, spruce-fir, and lodgepole pine communities in open areas or in shade and often streamside at (1310) 1520 to 3200 m in Beaver, Box Elder, Cache, Carbon, Davis, Duchesne, Emery, Grand, Iron, Juab, Millard, Piute, Rich, Salt Lake, San Juan, Sanpete, Sevier, Summit, Tooele, Uintah, Utah, Wasatch, Washington, and Weber counties; Alaska to Ontario, south throughout the western U. S. and into Mexico, rare in the northern Great Plains and eastward; 128 (viii). *Elymus glaucus* forms hybrids with *E. elymoides* and *E. trachycaulis* (see guide to hybrids p. 722). Blue wildrye provides good forage during summer months but is intolerant of heavy grazing (Valentine 1961).

Elymus hispidus (Opiz) Meld. Intermediate Wheatgrass. [*Agropyron hispidum* Opiz; *A. intermedium* (Host) Beauv.; *A. trichophorum* (Link) Richter; *Elytrigia intermedia* (Host) Nevski; *Thinopyrum gentryi* (Meld.) D. Dewey; *T. intermedium* (Host) Barkworth & D. Dewey]. Rhizomatous perennial; herbage glaucous to dark green; culms 4–15 dm tall; sheaths typically ciliate on at least one margin, occasionally short-hairy throughout, usually with well-developed auricles; blades flat or involute, 2–10 (12) mm wide, glabrous or more often scabrous or pubescent

with short stiff hairs; ligule to ca 0.5 mm long; spike stiffly erect, 6–20 (30) cm long, the rachis continuous, the internodes 6–20 mm long at midlength of the spike; spikelets solitary at each node, at maturity compressed, (8) 9–20 mm long, (1) 3– to 8–flowered, glabrous or hairy; glumes thickened and hardened, oblong to lanceolate, 4–9 mm long and (1.5) 2–3 mm wide at midlength, rounded to slightly keeled on the back, conspicuously 3– to 7–nerved, truncate to obtuse or occasionally acutish to abruptly mucronate or coarsely awn-tipped; lemma firm to hardened, oblong to lanceolate, 6–12 mm long, the sides visible between the glumes, 3– to 5–nerved, truncate to acutish or mucronate at the apex, rarely with an awn 1–10 mm long; anthers 3–5 (8) mm long; $2n = 42$. Dry to mesic sites, chiefly along roadsides and in other waste places, in sagebrush, mountain brush, pinyon-juniper, aspen, ponderosa pine, and spruce-fir communities at 1280 to 3050 m in all Utah counties except Box Elder, Iron, and Piute; native to Eurasia, introduced in much of the western U. S., sporadically in the Great Plains and in the Northeast; 101 (xiii). Intermediate wheatgrass, introduced from the U.S.S.R. in the 1930s, is used for pasture, hay, range seedings, and erosion control. A sod-former, adapted to well-drained soils where the mean annual rainfall is 30–36 cm or more, it is only slightly inferior to *Agropyron cristatum* in persistence, drought tolerance, and winter hardiness (Hanson 1972). The grass is highly palatable to all grazing animals throughout the spring and summer (Vallentine 1961).

Elymus junceus Fisch. Russian Wildrye. [*Psathyrostachys juncea* (Fisch.) Nevski]. Perennial; culms densely tufted, (2) 4–11 dm tall, erect or decumbent at the base; sheaths usually glabrous, often with well-developed auricles, old sheath bases more or less persistent, often ultimately shredding into fibers; blades flat to involute, 1–5 mm wide, glabrous or scaberulous; ligule 0.2–0.8 (1) mm long; spike 3–16 cm long and 5–17 mm wide, erect, the rachis at maturity disarticulating, often tardily so, the internodes mostly 2–5 mm long at midlength of the spike; spikelets (2) 3 per node, disarticulating above or below the glumes, 7–10 (12) mm long (excluding awns) and strongly overlapping, 2 (3) –flowered, the upper 1 or 2 florets often only slightly exceeding the lowermost one, sometimes reduced or obsolete; glumes subulate, (4) 5–9 mm long and to ca 0.5 mm wide near the base, obscurely 1–nerved, scabrous or puberulent, acute to awn-tipped, distinctly shorter than the lowermost lemma; lemma lance-elliptical, the rounded back visible between the glumes, 6–10 mm long, scabrous to densely short-hairy, tapered to a sharply acute tip or with an awn to ca 3 mm long; anthers 2.5–5 mm long; $2n = 14$. Salt desert shrub, sagebrush, pinyon-juniper, mountain brush, aspen, and ponderosa pine communities at 1280 to 2870 m in Box Elder, Daggett, Duchesne, Emery, Garfield, Iron, Juab, Kane, Millard, Piute, Salt Lake, Sevier, Tooele, Uintah, Washington, and Weber counties; native to the U. S. S. R., introduced in Canada, and from Montana to Arizona, in the Dakotas and Nebraska; 47 (vi). Russian wildrye was first introduced into the northern Great Plains in 1927 as a pasture grass and for use in erosion control. The species is especially useful in the Intermountain West because of its drought resistance and salt tolerance. Moreover, it remains green into August, thus providing a longer period of grazing than

crested wheatgrass, which matures earlier. Unfortunately, it has relatively low seedling vigor and poor seed production, although a strain with improved seed production is now available (Thornburg 1982).

Elymus lanceolatus (Scribn. & Sm.) Gould Thickspike Wheatgrass. [*Agropyron lanceolatum* Scribn. & Sm.; *A. albicans* Scribn. & Sm.; *Elymus lanceolatus* ssp. *albicans* (Scribn. & Sm.) Barkworth & D. Dewey; *A. dasystachyum* (Hook.) Scribn.; *A. elmeri* Scribn.; *A. griffithsii* Scribn. & Sm. ex Piper; *A. riparium* Scribn. & Sm.; *Elymus subvillosus* (Hook.) Gould; *Elytrigia dasystachya* (Hook.) Love & Love]. Perennial, strongly rhizomatous; herbage typically glaucous; culms mostly erect, 3–13 dm tall, solitary or tufted; sheaths glabrous or rarely ciliate on the margins to puberulent or long-hairy, often with well-developed auricles; blades involute or occasionally flat and then 1–3.5 (5) mm wide, usually stiffly ascending, glabrous or scaberulous to long-hairy; ligule to ca 1 mm long; spike stiffly erect, 6–22 cm long, the rachis continuous, the internodes 5–16 mm long at midlength of the spike; spikelets solitary at each node of the rachis or occasionally in pairs at a few nodes, 3– to 12–flowered, 7–20 (24) mm long, mostly closely overlapping except sometimes near the base of the spike; glumes subequal or unequal, lance-elliptical to oblanceolate, mostly conspicuously (2) 3–5 (7) –nerved, glabrous to puberulent, 4–10 (11) mm long and 1–2 mm wide at the widest point, tapered from midlength or above to an acute or awn-tipped apex, the body mostly 2–6 mm shorter than the body of the lowermost lemma; lemma rounded on the back, the sides visible between the glumes, 7–14 mm long, glabrous or scaberulous to short-pubescent, (3) 5– to 7–nerved, subacute to awn-tipped at the apex; anthers (2.5) 3–5 mm long; $2n = 28$. Roadsides and other disturbed sites, sagebrush, juniper, mountain brush, aspen, and meadow communities, at 1220 to 3350 m in all Utah counties except Beaver; Alaska and across Canada, south throughout the western U. S. and in Mexico, in the Great Plains south to Kansas, and in the East as far south as West Virginia; 240 (ix). The name *Agropyron albicans* was originally applied to a plant differing from *E. lanceolatus* in having lemmas with divergent awns to ca 15 mm long. Dewey (Amer. J. Bot. 57: 12–18. 1970) demonstrated its origin from a cross between *E. lanceolatus* (as *A. dasystachyum*) and *E. spicatus* (as *A. spicatum*). The hybrid has been classified as a subspecies of *E. lanceolatus* (Barkworth et al. 1983); but, because as hybrids awned plants can be expected to occur sporadically, I see no advantage in obscuring their origin by assigning them subspecific status (see guide to hybrids p. 722). Thickspike wheatgrass is low in productivity and has only fair forage value (Vallentine 1961). Because of its sod-holding ability, however, it is being widely used for revegetating mine spoils and other disturbed areas.

Elymus repens (L.) Gould Quackgrass; Couchgrass. [*Triticum repens* L.; *Agropyron repens* (L.) Beauv.; *Elytrigia repens* (L.) Nevski]. Rhizomatous perennial; herbage dark green or occasionally glaucous; culms erect or occasionally decumbent at the base, 5–16 dm tall, solitary or loosely tufted; sheaths glabrous or the lowermost sparsely to densely pubescent with soft spreading hairs, often with well-developed auricles; blades mostly lax to stiffly ascending, flat or loosely involute on drying,

(2) 5–15 mm wide, at least some of the blades of any one plant 5 mm or more wide, scabrous or hairy; ligule to ca 0.5 mm long; spike erect, 5–20 cm long, the rachis continuous, the internodes mostly 3–7 (8) mm long at midlength of the spike, the spikelets usually no less than twice as long as the internodes throughout the spike; spikelets solitary at each node of the rachis or occasionally in pairs at a few nodes, 8–17 (20) mm long, 3– to 6 (8) –flowered; glumes lanceolate to lance-elliptical, usually asymmetrical, more or less keeled, 6–11 mm long, ca 2/3 as long to slightly longer than the lowermost lemma, mostly 1.3–3 mm wide at midlength, rounded to somewhat keeled on the back, conspicuously 3– to 9–nerved, glabrous or scabrous on the midnerve, gradually long-tapered to an acute or awn-tipped apex, sometimes abruptly so, occasionally with an awn to 5 mm long; lemma rounded on the back to somewhat keeled, the sides visible between the glumes, 6–12 mm long, glabrous or scabrous near the tip, 5–nerved, tapered to an acute to awn-tipped apex or with an awn to 10 (15) mm long; anthers (3) 4–7 mm long; $2n = 42$. Chiefly in disturbed, mesic to moist sites, often as a weed of cultivated lands, along waterways and in meadows, occasionally in mountain brush and conifer communities, at 1220 to 3050 m in Box Elder, Cache, Carbon, Daggett, Duchesne, Garfield, Juab, Kane, Millard, Rich, Salt Lake, Sanpete, Uintah, Utah, Wayne, and Weber counties; native to Eurasia, now circum-boreal, south through the U. S. except in the southern states; South America; 88 (x). *Elymus repens* occasionally forms hybrids with *Agropyron cristatum* (see guide to hybrids, p. 722). Quackgrass provides fairly good spring forage, is a rapid invader, and quickly stabilizes moist, eroding soils. It is considered a noxious weed in cultivated areas, however, and is not recommended for seeding (Valentine 1961).

Elymus salinus Jones Salina Wildrye; Bullgrass. [*E. ambiguus* var. *salina* (Jones) C. L. Hitchc.; *E. ambiguus* var. *salmonis* C. L. Hitchc.; *Leymus salinus* (Jones) Love; *L. salinus* ssp. *salmonis* (C. L. Hitchc.) Atk.]. Perennial, often short-rhizomatous, occasionally with rhizomes well developed; herbage green or more often glaucous; culms densely tufted, mostly erect, 4–14 dm tall; sheaths glabrous or scabrous to rarely pubescent, often with well-developed auricles, old sheath bases persistent, more or less papery, usually straw-colored but sometimes darkened, typically becoming loose, flattened, and forming a conspicuous feature; blades firm, flat or more often strongly involute, 2–3 (4) mm wide, glabrous or scabrous to puberulent, sometimes ciliate near the base; ligule 0.2–1.5 mm long; spike erect, 4–15 cm long and 2.5–8 mm wide, the rachis continuous, the internodes (3) 5–13 mm long at midlength of the spike; spikelets usually solitary at most of the nodes, occasionally paired at some or rarely most of the nodes, 9–17 (21) mm long, 3– to 6–flowered, light green or tinged with lavender; glumes subulate, subequal to distinctly unequal, nerveless or obscurely 1–nerved, keeled or rounded on the back, glabrous or scabrous, 1–12 mm long and 0.4–1 mm wide at the base, occasionally a spikelet reduced to a solitary glume or the first glume much reduced or lacking, the second glume typically shorter than the lowermost lemma; lemma lance-elliptical, rounded on the back, the sides or the back visible between the glumes, 7–12.5 mm long, 5– to 7–nerved, sometimes obscurely so, occasionally lavender-tinged, typically dull but occasionally shiny,

glabrous or rarely scabrid-puberulent, awnless or tapered to an awn to 2.6 mm long; anthers 3–7.5 mm long; $2n = 28, 42, 56$. Chiefly on dry, sandy, gravelly, or rocky sites in salt desert shrub, desert shrub, sagebrush-grass, and pinyon-juniper communities, less frequently in mountain brush, ponderosa pine, and aspen-fir communities, at 1520 to 3050 m in Box Elder, Carbon, Daggett, Duchesne, Emery, Garfield, Grand, Kane, Millard, San Juan, Sanpete, Sevier (type from Salina Pass), Tooele, Uintah, Utah, Wasatch, and Wayne counties; Idaho, Nevada, California, Colorado, Wyoming, and Arizona; 304 (iii). Based on other plant names published at the same time, Atkins et al. (1984) conclude that Jones intended the epithet for this species to be *salinus* rather than *salina*. Barkworth and Atkins (1984) recognize two subspecies in *E. salinus* (as *Leymus salinus*), based on correlation between herbage pubescence or lack thereof and the number of spikelets per node. Examination of hundreds of Utah specimens of *E. salinus* revealed no consistent correlation between these characters. The one specimen that did combine pubescent sheaths with paired spikelets at most nodes of the rachis (Taye 1326 UT) appeared to be a hybrid between *E. salinus* and *E. triticoides*. *Elymus triticoides* is usually readily distinguished from *E. salinus* by its habitat preference, conspicuous rhizomes, darkened, papery, usually pubescent sheaths, broader leaves, and mostly paired spikelets. Each of these characters can occasionally be seen in *E. salinus*, however, perhaps due to intergradation between the two taxa. *E. salinus* also appears to form hybrids with *E. elymoides*, *E. cinereus*, and *E. lanceolatus* (see guide to hybrids, p. 722). *Elymus ambiguus* (as *Leymus ambiguus*) has been reported from Utah, but according to Atkins et al. (1984), is a distinct taxon restricted to the Colorado Front Range. Salina wildrye provides a moderate amount of fair quality forage during the growing season but is unpalatable when mature and dried (Valentine 1961).

Elymus scribneri (Vasey) Jones Scribner or Spreading Wheatgrass. [*Agropyron scribneri* Vasey]. Perennial; culms tufted, 0.4–4 (6) dm long, prostrate to curved-ascending, often geniculate at the lower nodes or flexuous throughout; leaves often chiefly basal; sheaths glabrous to short-hairy with auricles present or more often lacking, the sheath bases of previous years persistent, pale and papery, often a conspicuous feature; blades flat to involute, 1–3 (4) mm wide, glabrous to puberulent, the ligule to ca 0.5 mm long; spike often nodding or flexuous, 3–7 cm long (excluding awns), the rachis ultimately disarticulating, the internodes 2–4 (5) mm long at midlength of the spike; spikelets solitary at each node of the rachis or rarely in pairs at a few nodes, (2) 3– to 6–flowered, 9–14 mm long; glumes linear to narrowly lanceolate, the body 4–8 mm long and 0.3–1.5 mm wide, 1– to 3 (5) –nerved, the midnerve prolonged as a usually divergent, scabrous awn (4) 8–30 mm long, a short lateral awn sometimes present; lemma rounded on the back, the sides visible between the glumes, 7–10 mm long, glabrous to scabrid-puberulent, 5–nerved, the midnerve prolonged as a divergent to recurved, scabrous awn 10–30 (40) mm long; anthers 1–1.7 mm long; $2n = 28$. Open, often rocky slopes and exposed alpine ridges, rare in openings in mountain brush and ponderosa pine communities at (2740) 3050 to 3810 m in Beaver, Cache, Daggett, Duchesne, Garfield, Grand, Iron, Juab, Piute, Salt Lake, San Juan, Sanpete, Sevier, Summit, Uintah, and Utah counties; British

Columbia and Alberta, south in the mountains of the western U. S.; 106 (iii). *Elymus scribneri* hybridizes with *E. trachycaulis* (see guide to hybrids, p. 722).

Elymus simplex Scribn. & Will. Alkali Wildrye. [*E. triticoides* var. *simplex* (Scribn. & Will.) A. S. Hitchc.; *Leymus simplex* (Scribn. & Will.) D. Dewey]. Perennial, strongly rhizomatous; herbage glaucous; culms mostly erect, 1.5–9 dm tall; sheaths glabrous; auricles lacking or sometimes well developed, the old sheath bases papery; blades firm, usually involute, 1–4 mm wide, glabrous or scaberulous to puberulent; ligule 0.3–0.5 mm long; spike erect, 6–16 (20) cm long and to ca 8 mm wide, the rachis continuous, the internodes 5–10 mm long at midlength of the spike; spikelets solitary or occasionally in pairs at some or all nodes of the rachis, 11–20 (25) mm long, 3– to 6 (10)–flowered, light green or rarely tinged with lavender; glumes subulate to lanceolate, mostly subequal, rounded to somewhat keeled on the back, nerveless or obscurely 1 (3)–nerved, smooth or occasionally scabrous, 5–16 mm long and mostly 0.3–1.5 mm wide near the base, awn-tipped or with awns to ca 3 mm long; lemma more or less firm, lanceolate, 7–11 mm long, rounded on the back, the sides usually visible between the glumes, obscurely nerved, glabrous or occasionally puberulent, gradually tapered to an awn 2–7 mm long; anthers 3–5 mm long; $2n = 28$. Known in Utah only from along the Green River in Daggett County, Wyoming and Colorado; 1 (0). *Elymus simplex* is said to differ morphologically from *E. triticoides* chiefly in having spikelets mostly solitary rather than mostly paired at each node of the rachis and in having awns of the lemma to 7 mm long. Barkworth and Atkins (1984) treat *E. simplex* (as *Leymus simplex*) at the level of species but note that additional data may show that it would be more appropriately treated at an infraspecific rank.

Elymus smithii (Rydb.) Gould Western Wheatgrass. [*Agropyron smithii* Rydb.; *Elytrigia smithii* (Rydb.) Love; *Pascopyrum smithii* (Rydb.) Love]. Perennial, strongly rhizomatous; herbage glaucous, rarely yellow green; culms erect, mostly 2–11 dm tall; sheaths glabrous to rarely densely puberulent, frequently with well-developed auricles, old sheath bases often pale and more or less conspicuous; blades firm, involute to flat, 1–5 (6) mm wide, scaberulous to variously hairy; ligule to ca 1 mm long; spike stiffly erect, (3) 6–20 cm long, the rachis continuous, the internodes 4–16 mm long at midlength of the spike; spikelets solitary at each node of the rachis or not infrequently in pairs at some nodes, (3) 5– to 12–flowered, 13–26 (30) mm long; glumes firm, subequal to unequal, linear-lanceolate to lanceolate, typically prominently ribbed with 3–7 nerves, glabrous or scaberulous to puberulent, 8–15 mm long, 1.3–2 mm wide near the base and tapered from below midlength to a sharply acute, often awnlike apex, the second glume typically at least as long as the body of the lowermost lemma; lemma lanceolate, 8–14 mm long, rounded or somewhat keeled on the back, the sides visible between the glumes, 5–nerved, glabrous or scabrous to occasionally pubescent, sharply acute to more often awn-tipped or with an awn to ca 5 mm long; anthers (2.5) 3–5 mm long; $2n = 28, 42, 56$. Chiefly on dry, open, often disturbed sites in salt desert shrub, sagebrush, mountain brush, and pinyon-juniper communities, rarely on open slopes at higher elevations, at 1220 to 2130 (2740) m in Beaver, Box

Elder, Cache, Carbon, Daggett, Davis, Emery, Garfield, Grand, Iron, Millard, Morgan, Salt Lake, San Juan, Sanpete, Sevier, Summit, Tooele, Uintah, Utah, Wasatch, Washington, and Weber counties; Alaska and British Columbia to Quebec, south throughout the western and central U. S., sparingly introduced in the eastern U. S. and in Europe; 105 (x). *Elymus smithii*, the only octoploid species in the Triticeae, rarely if ever hybridizes with other members of the tribe (Dewey 1984). Western wheatgrass is the dominant grass in some areas of our region. Although its palatability is variable, it ranks as a valuable range grass, becoming coarse and stiff during the summer, but curing well and providing a good source of winter forage. The grass is widely planted for reclamation of surface mines and in erosion control, but is not regularly used for range seeding because it is normally less palatable than intermediate, tall, and even crested wheatgrass (Vallentine 1961). It is best adapted to a mean annual precipitation of 36–50 cm and to silt or clay soils, although it performs satisfactorily on sandy soils and will tolerate even strongly saline ones (Thornburg 1982).

Elymus spicatus (Pursh) Gould Bluebunch Wheatgrass. [*Festuca spicata* Pursh; *Agropyron spicatum* (Pursh) Scribn. & Sm.; *A. inerme* (Scribn. & Sm.) Rydb.; *A. spicatum* var. *inerme* (Scribn. & Sm.) Heller; *Elytrigia spicata* (Pursh) D. Dewey; *Pseudoroegneria spicata* (Pursh) Love]. Perennial, rarely with short rhizomes; herbage green or glaucous; culms densely tufted, 3–10 dm tall, erect or nearly so; sheaths glabrous or puberulent to soft-hairy, usually with well-developed auricles; blades flat to more often involute, 1–3.5 (4.5) mm wide, glabrous or more often puberulent to variously pubescent; ligule to ca 1 mm long; spikes typically erect, 6–20 cm long, the rachis continuous, the internodes 7–17 mm long at midlength of the spike; spikelets rarely more than 1 per node, 5– to 8–flowered, mostly 10–20 mm long, those at midlength of the spike rarely exceeding the internodes by more than 1/3 their length; glumes mostly subequal, oblong-elliptical to somewhat oblanceolate, conspicuously 3– to 7–nerved, 4.5–12 mm long, 1–2.2 mm wide at midlength, glabrous or scaberulous, obtuse to acute or rarely awn-tipped, from ca 1/2 to as long as the lowermost lemma; lemma lance-elliptical, usually rounded on the back, the sides visible between the glumes, the body 7–13 mm long, 5–nerved, glabrous or rarely scaberulous, acute or more often terminating in an ultimately widely divergent awn (3) 6–25 mm long; anthers 4–6 mm long; $2n = 14, 28$. Sagebrush, pinyon-juniper, mountain brush, aspen, ponderosa pine, and openings in spruce-fir communities at 1370 to 2900 m in all Utah counties except San Juan and Wayne; Alaska to Saskatchewan, south to California, Arizona, New Mexico, and Texas; 294 (vi). The awnless form of *E. spicatus*, at one time referred to *Agropyron inerme*, occurs at random essentially throughout the range of the species, and is not deemed deserving of formal taxonomic recognition. *Elymus spicatus* hybridizes in nature with *E. lanceolatus* and with *E. elymoides* (see guide to hybrids, p. 722). Bluebunch wheatgrass is the dominant species in some grassland areas of the Pacific Northwest and in the Intermountain Region, forming up to 60 percent of foliage cover in some localities (D. D. Collins, dissertation, Montana State University, 1965), and is considered one of the most important forage grasses on western rangelands. A cultivar of the awnless form of the species tolerates drought and is adapted to the

same soils and climate as crested wheatgrass (Thornburg 1982). Cultivars thus far developed do not, however, match crested wheatgrass in seedling vigor.

Elymus trachycaulus (Link) Gould ex Shinners Slender Wheatgrass. [*Triticum trachycaulum* Link; *Agropyron trachycaulum* (Link) Malte; *A. caninum* authors, not (L.) Beauv.; *A. latiglume* (Scribn. & Sm.) Rydb.; *A. pauciflorum* (Schwein.) sensu A. S. Hitchc., not Schur; *A. subsecundum* (Link) A. S. Hitchc.; *A. tenerum* Vasey; *A. violaceum* authors, not (Hornem.) Lange; *A. violaceum* var. *andinum* Scribn. & Sm.; *Elymus subsecundus* (Link) Love & Love]. Perennial, occasionally with short rhizomes; culms tufted, 3–10 (15) dm tall, erect or decumbent at the base; sheaths glabrous or retrorsely puberulent, the auricles short or lacking; blades stiffly ascending to somewhat lax, usually flat, 2–7 (8) mm wide, glabrous or scabrous to short-hairy; ligule to ca 0.5 mm long; spike slender, 4–20 (25) cm long, stiffly erect, the rachis continuous, the internodes at midlength mostly 4–9 mm long; spikelets solitary at each node of the rachis, 3– to 7-flowered, 9–20 mm long, those at midlength of the rachis usually about twice as long as the internodes; glumes oblong-elliptical, conspicuously (3) 5- to 7 (9)-nerved, glabrous or scaberulous, (5) 6–15 mm long and 1–3 mm wide at midlength, gradually or abruptly tapered to an acute or awn-tipped apex or with an awn to ca 5 mm long, the second glume at least 2/3 as long as the body of the adjoining lemma, sometimes slightly exceeding it; lemma rounded on the back, the sides visible between the glumes, 7.5–13 mm long, glabrous or scabrous to minutely hairy, 3- to 5-nerved, acute to awn-tipped or with an awn 2–20 (30) mm long; anthers 0.6–2.2 mm long; $2n = 28$. Chiefly in grass-sagebrush, mountain brush, aspen, ponderosa pine, spruce-fir, and lodgepole pine communities, in alpine meadows and on exposed rocky slopes, at (1280) 1370 to 3660 m, in all Utah counties; Alaska, through much of Canada, south in the U. S. throughout the western, central, and northeastern states and in northern Mexico; Siberia; introduced in temperate Eurasia; 595 (xix). The small-anthered, largely self-fertilized complex of grasses to which *E. trachycaulus* belongs is widespread throughout the northern hemisphere. Because of a strong resemblance between the two species, North American plants were referred to *Agropyron caninum* (L.) Beauv. by C. L. Hitchcock et al. (1969), but examination of Eurasian material at the Komarov Botanical Institute revealed that the plant now known as *Elymus caninus* (L.) L. is the forest phase of the Eurasian portion of the complex for which there is no North American counterpart. *Elymus trachycaulus* hybridizes with *Hordeum jubatum*, *Agropyron cristatum*, *Elymus lanceolatus*, *E. scribneri*, *E. elymoides*, *E. glaucus*, *E. canadensis*, and possibly *E. repens* (see guide to hybrids, p. 722). Slender wheatgrass is useful as a short-lived species in reclamation plantings and range seedings. Adapted strains may be grown in areas with a minimum mean annual precipitation of 36 cm (Thornburg 1982).

Elymus triticoides Buckley Beardless or Creeping Wildrye. [*Leymus triticoides* (Buckley) Pilger]. Perennial, strongly rhizomatous; herbage glaucous or green; culms erect, 1.5–12.5 dm tall; sheaths typically hairy to some degree, often with well-developed auricles, the old sheath bases usually papery and darkened, rarely if ever disintegrating into fibers; blades moderately stiff, flat to involute, (1) 2–7 (10) mm wide, typically scaberulous to

hairy; ligules mostly less than 1 mm long; spikes erect, 3–20 cm long and 5–15 mm wide, the rachis continuous, the internodes 2–10 mm long at midlength of the spike; spikelets usually in pairs at each node of the rachis, occasionally solitary at some or rarely all nodes, (6) 8–22 mm long, 3- to 6 (8)-flowered, mostly glaucous or brownish, sometimes faintly purple-tinged; glumes subulate to narrowly lanceolate, subequal to unequal, flat or rounded to somewhat keeled on the back, nerveless or obscurely 1 (3)-nerved, 4–16 mm long and 0.3–1.5 mm wide near the base, acute to awn-tipped apically, shorter to longer than the lowermost lemma, occasionally the first glume lacking or both glumes of the upper spikelets reduced or obsolete; lemma typically leathery, elliptical to lanceolate, rounded on the back, the sides or backs visible between the glumes, the body 5–12 mm long, 5- to 7-nerved, usually obscurely so, generally darkened below the apex, shiny, glabrous or pubescent, acute to abruptly awn-tipped or with a stout awn to ca 3 mm long; anthers (2.5) 3–6 mm long; $2n = 28$. Saline meadows, salt desert shrub, and juniper communities at 1280 to 1830 m in Box Elder, Daggett, Davis, Juab, Millard, Rich, Salt Lake, San Juan, Sanpete, Sevier, Tooele, Utah, and Weber counties; throughout the western U. S., in Texas and Mexico; 41 (iii). *Elymus triticoides* forms natural hybrids with *E. cinereus* and *E. salinus* (see guide to hybrids, p. 722). Plants tentatively identified as *E. flavescens* Scribn. & Sm. have been collected from Tooele County (Taye 746 UTC); but they are unlike typical specimens of that species in having spikelets solitary rather than paired at each node of the rachis, the lemmas rounded on the back rather than mostly laterally compressed, and awn-tipped rather than acute. The Utah material appears to be a pubescent phase of *E. triticoides*. Beardless wildrye is a salt-tolerant, sod-forming grass, especially valuable for soil stabilization because of its ability to grow in a wide range of soil types.

Elymus virginicus L. Virginia Wildrye. Perennial; culms tufted, 6–12 dm tall; sheaths glabrous, usually with well-developed auricles; blades lax, flat, (2) 4–10 (15) mm wide; ligule to ca 0.5 mm long; spike stiffly erect, 4–17 cm long, the rachis continuous; spikelets mostly 2 per node, strongly overlapping, 4- to 5-flowered, disarticulating below the glumes; glumes subulate to narrowly lanceolate, 7–22 mm long, the usually yellowish base nerveless, subterete, hardened, and typically curved outward (exposing the base of the lowermost floret), broadened and conspicuously 2- to 5-nerved above the base, mostly 1–2 mm wide at about midlength, awn-tipped or with an awn to ca 20 mm long; lemma lance-elliptical, 6–9 mm long, the rounded back usually visible between the glumes, glabrous to minutely hairy, 5-nerved, tapered to an awn to 30 mm long or in ours (*var. submuticus* Hook.) merely awn-tipped; anthers 1.5–3 mm long; $2n = 28$. A weed of cultivated areas, below 1830 m in Cache, Utah, Wasatch, and Weber counties; British Columbia to Newfoundland, south through most of the U. S.; introduced in Europe; 3 (0). Where their ranges overlap, *E. virginicus* and *E. canadensis* are known to hybridize.

Enneapogon Desv. ex Beauv.

Annuals or perennials; culms tufted; sheaths open almost to the base; blades flat to involute; ligule a ring of hairs; inflorescence a compact to spikelike panicle; spikelets subterete, 3- to 6-flowered, some of the upper

florets reduced, the rachilla disarticulating above the glumes and tardily between the florets; glumes membranous, (3) 7- to 9-nerved, longer than the body of the lemma; lemma broad, conspicuously 9-nerved, the nerves prolonged as (3) 7-9 equal or subequal awns; stamens 3; caryopsis free within the lemma and palea, the embryo 3/4-5/6 the length of the grain; $x = 10$.

Enneapogon desvauxii Beauv. Spike Pappusgrass. [*Pappophorum wrightii* Wats.]. Perennial, sometimes flowering the first year; culms tufted, 1-5 dm tall, often geniculate, ultimately disarticulating at the nodes; sheaths open, usually pubescent; blades filiform, 0.5-2 mm wide, mostly 2-12 cm long, folded to involute, hairy to some degree; ligule a ring of hairs to ca 1 mm long; panicle spike-like, 2-9 cm long, gray green to gray, bristly; spikelets mostly 5-7 mm long including the awns, typically 3-flowered, the lowermost floret perfect, the middle floret perfect, staminate, or neuter, the uppermost typically reduced to multiple awns; cleistogamous, 1-flowered spikelets often developing in the lower leaf sheaths; glumes lanceolate, usually sparsely puberulent, subequal, 3- to 9-nerved, mostly 3-5 mm long, longer than the body of the uppermost lemma; lemma broad, pubescent on the rounded back, the body 1.3-2.5 mm long, with 9 strong nerves prolonged as subequal plumose awns 3-4.5 mm long; anthers 0.2-0.6 mm long; $2n = 20$. Dry, sandy or gravelly to rocky soil on open desert flats and slopes below 1800 m in Beaver, Emery, Garfield, Grand, Kane, and Millard counties; California, Arizona, New Mexico, Texas, and Mexico; South America; Asia; 16 (0).

***Eragrostis* N. M. Wolf**

Annuals or perennials, tufted or in a few species rhizomatous; sheaths open, often long-hairy at the summit, otherwise glabrous or hairy; blades flat or folded to involute; ligule a ring of hairs or rarely membranous; inflorescence an open to spike-like panicle; spikelets subterete to laterally compressed, (2) 3- to 40-flowered, pale green or gray to nearly black, either the lemmas falling and the paleas persistent on an intact rachilla, or the rachilla disarticulating above the glumes and between the florets; glumes usually membranous, lanceolate or ovate, subequal or unequal, keeled or rounded on the back, 1 (3)-nerved, obtuse to sharply acute at the apex, shorter than the lowermost lemma; lemma usually membranous, lanceolate to broadly ovate, keeled or rounded on the back, 3-nerved, the nerves nearly parallel and typically conspicuous, the apex obtuse to sharply acute, awnless; palea variable in length; stamens 2 or 3; caryopsis falling free of the lemma and palea, rounded or shallowly to deeply grooved on the ventral side, the embryo 2/5-2/3 as long as the grain; $x = 10$.

Koch, S. 1974. The *Eragrostis pectinacea-pilosa* complex in North and Central America (Gramineae: Eragrostoidae). Illinois Biol. Monogr. 48: 1-74.

———. 1978. Notes on the genus *Eragrostis* (Gramineae) in the southeastern United States. Rhodora 80: 390-403.

- 1. Plants perennial; spikelet rachilla disarticulating, all but the lowermost florets falling with the rachilla internodes 2
- Plants annual; spikelet rachilla remaining intact, the lemmas falling, the paleas usually persistent 3

- 2(1). Basal leaf blades often more than 30 cm long and flexuous or arching toward the ground; pedicels remaining appressed to the branchlets *E. curvula*
- Basal leaf blades mostly 2-10 cm long, stiffly ascending to spreading; pedicels ultimately spreading *E. lehmanniana*
- 3(1). Craterlike glands or glandular bands on pedicels or leaf blade margins 4
- Craterlike glands not present on panicle branches or leaf margins 5
- 4(3). Mature spikelets averaging more than 2 (2-4) mm wide at midlength; lemmas frequently bearing craterlike glands on the midnerve, averaging at least 0.8 mm wide midnerve to margin *E. cilianensis*
- Mature spikelets averaging not more than 2 (1.5-2.2) mm wide at midlength; lemmas rarely glandular on the midnerve, averaging less than 0.8 mm wide midnerve to margin *E. minor*
- 5(3). Culms decumbent to prostrate and often rooting at the nodes, rarely erect; panicles mostly less than 4 (1-6) cm long; palea to about half as long as the lemma *E. hypnoides*
- Culms erect to occasionally prostrate but not rooting at the nodes; panicles mostly more than 4 cm long; palea more than half as long as the lemma 6
- 6(5). Spikelets 0.6-1.2 mm wide; caryopses flattened and shallowly to deeply grooved on the ventral side; panicles 15-40 cm long, the branchlets and pedicels ultimately widely spreading to reflexed *E. mexicana*
- Spikelets at maturity averaging more than 1.2 (1-2.5) mm wide; caryopses terete, not grooved; panicles 5-35 cm long, the branchlets and pedicels diverse 7
- 7(6). Primary panicle branches mostly spikelet-bearing to within 1-3 mm of the base, the branchlets and pedicels ultimately spreading; lemmas often obtuse at the apex; culms and rachis of the panicles usually bearing a complete or partial ring of yellow glandular tissue below the nodes *E. barrelieri*
- Primary panicle branches mostly naked for more than 3 mm above the base; branchlets and pedicels at maturity typically appressed to the branches; lemmas acute; culms and panicles without glandular tissue below the nodes (which may be yellow) *E. pectinacea*

Eragrostis barrelieri Daveau Mediterranean Lovegrass. Annual; culms tufted, 1-6 dm long, erect to decumbent-ascending or prostrate, branching from the lower nodes, usually with a complete or partial ring of yellow glandular tissue below the panicle and below the nodes; sheaths long-hairy at the summit, otherwise glabrous; blades flat to involute, 1-5 mm wide and mostly 2-10 cm long, glabrous or scaberulous, occasionally sparsely hairy; ligule a ring of hairs; panicle open, ovoid to narrowly oblong, 5-16 cm long and to ca 7.5 cm wide, the primary branches ultimately stiffly spreading, branchlets or pedicels smooth or scaberulous, typically arising within 1-3 (4) mm of the base, ultimately widely spreading; spikelets compressed, lance-linear, 5-11 (15) mm long, 1.2-1.5 mm wide, 6- to 15 (20)-flowered, pale to dark gray green, the rachilla remaining intact at fruiting; glumes subequal, 0.8-1.8 mm long, 1-nerved; lemma lanceolate to elliptical, 1.8-2.5 mm long, 3-nerved, acute to more often obtuse at the apex; palea at least 2/3 as long as the lemma; anthers 0.2-0.5 mm long; caryopsis subglobose to broadly ellipsoidal, to ca 1 mm long, not

ventrally grooved; $2n = 60$. Gardens and disturbed, often sandy sites below 1520 m in Salt Lake, San Juan, and Washington counties; native to the Mediterranean region of Europe, introduced in North America through most of the southwestern U. S., east to Texas and Kansas, naturalized in Mexico (Koch 1978); South America; 5 (i).

Eragrostis cilianensis (All.) Mosher Stinkgrass. [*Poa cilianensis* All.; *E. megastachya* (Koeler) Link]. Annual; herbage with few to many craterlike glands, malodorous when fresh; culms tufted, 1–6(8) dm tall, ascending or spreading to prostrate, often branching from the lower nodes, usually with a ring of glands below the nodes; sheaths long-hairy at the summit, often bearing scattered, craterlike glands; blades flat or folded, 2–7 (8) mm wide, glabrous or scaberulous to occasionally long-hairy, with craterlike glands especially numerous along the margins; ligule a ring of hairs; panicle compact to somewhat open, ovoid to oblong, 1–16 (20) cm long and 1–5 (7) cm wide, the branches ascending-spreading, the pedicels at maturity spreading, 0.3–7 mm long, averaging less than 2 mm long, often gland-dotted, otherwise smooth or scaberulous; spikelets compressed, ovate to lanceolate or oblong, 7– to 40– flowered, 4–15 (20) mm long and at maturity 2–3 (4) mm wide at midlength, pale to dark gray green, occasionally tinged with dull purple, the rachilla remaining intact at fruiting; glumes subequal, 1–2.5 mm long, 1– (3)–nerved, the midnerve often beset with craterlike glands; lemma slightly firmer than the glumes, ovate, 1.5–2.8 mm long, 3–nerved, often bearing craterlike glands along the midnerve, abruptly acute at the apex; palea at least 2/3 as long as the lemma; anthers 0.2–0.5 mm long; caryopsis globose to ovoid or ellipsoidal, 0.6–0.8 mm long, not ventrally grooved; $2n = 20, 40$. Weed of gardens and dry to mesic, disturbed sites at 850 to 2320 m in Box Elder, Cache, Carbon, Davis, Grand, Kane, Salt Lake, Tooele, Uintah, Utah, Washington, and Weber counties; native to Eurasia, introduced in Canada and widespread throughout the U. S., in northern Mexico; South America; 49 (iv).

Eragrostis curvula (Schrader) Nees Weeping Lovegrass. [*Poa curvula* Schrader; *E. chloromelas* Steud.]. Perennial; culms tufted, (3) 6–12 (18) dm tall, erect, occasionally branching at the lower nodes; sheaths glabrous or hairy, sometimes with long hairs at the summit, the lowermost often hard and yellowish, densely appressed-hairy near the base; blades involute and in that state mostly less than 1.4 mm wide, long-tapered to filiform tips, the basal leaves often more than 30 cm long and flexuous or arching toward the ground; ligule a ring of short hairs; panicle variable, contracted to open, oblong, 6–40 cm long and to mostly 5–12 cm wide, erect or nodding, the branches strongly ascending to spreading, the pedicels remaining appressed to the branches; spikelets subterete to moderately compressed, 4– to 15–flowered, linear, 4–10 mm long and 1–1.6 mm wide, pale to dark gray green, the rachilla disarticulating between the florets above, the rachilla internodes falling with the florets, the lower internodes often persistent; glumes somewhat unequal, the first 1–2 mm long, 1–nerved, the second 1.5–3 mm long, 1– to 3–nerved; lemma lanceolate, 1.8–3 mm long, 3–nerved, glabrous or scaberulous, acute to rounded at the apex, often variable within any one panicle; palea about as long as the lemma; anthers 1–1.3 mm long; caryopsis elliptical, 1.1–1.7 mm long and to 0.7 mm wide, not ventrally grooved; $2n = 20,$

40, 50, 60. Desert shrub and juniper communities, usually on disturbed sites, below 1520 m in Grand and Washington counties; native to South Africa, introduced into much of the southern U. S.; South America; 5 (0). Weeping lovegrass is used throughout much of the southern U. S. for erosion control and as a pasture grass.

Eragrostis hypnoides (Lam.) B.S.P. Teal or Creeping Lovegrass. [*Poa hypnoides* Lam.]. Annual, often mat-forming; culms tufted, 1–3 dm long, branching at the base and above, decumbent to prostrate or rarely erect, rooting at the nodes; sheaths long-hairy at the summit and occasionally sparsely so below; blades flat or folded, mostly 0.7–2 mm wide, to about 4 cm long, usually hairy on one or both surfaces; ligule a ring of hairs; panicle contracted to open, ellipsoidal to ovoid, 1–4 (6) cm long and to ca 3 cm wide, the branches ascending to spreading, the branches and pedicels usually with at least a few minute hairs; spikelets compressed, 7– to 22 (40)–flowered, linear-lanceolate, 2.5–15 (20) mm long, mostly pale green, sometimes purple-tinged, glabrous or minutely hairy, the rachilla remaining intact at fruiting; glumes 1–nerved, more or less unequal, the first 0.5–1 mm long, the second 1–1.8 mm long; lemma narrowly lanceolate, 1.5–2 mm long, 3–nerved, often fluted, acute; palea to about half as long as the lemma; anthers to 0.3 mm long; caryopsis compressed, ovate to elliptical, to about 0.6 mm long; $2n = 20$. Along waterways, in marshes and beds of drying ponds below 1520 m in Box Elder, Cache, Utah, and Wasatch counties; Canada, south through most of the U. S. and in Mexico; South America; 22 (0).

Eragrostis lehmanniana Nees Lehmann Lovegrass. Perennial; culms tufted, 4.5–7.5 dm tall, erect or decumbent to prostrate, the latter often rooting at the nodes, typically geniculate, sometimes branched above the base; sheaths glabrous or sometimes with a few long hairs at the summit, the lowermost papery, whitish, and often short-hairy at the very base; blades involute, to ca 1 mm wide and mostly 2–10 cm long, mostly stiffly ascending to spreading; ligule a ring of short hairs; panicle open, narrowly oblong to lanceolate, 7–18 cm long and 3–8 cm wide, erect, the branches stiffly ascending to moderately spreading, 4–8 cm long, the pedicels ultimately spreading, much shorter than the spikelets; spikelets slightly compressed, narrowly oblong, mostly 5– to 8 (12)–flowered, 5–14 mm long and 0.8–1 mm wide, gray green to dark gray, the upper rachilla internodes falling with the florets, the lower internodes persistent; glumes unequal, the first 1–1.6 mm long, 1–nerved, the second 1.4–1.8 mm long, 1–nerved; lemma oblong, 1.8–2.2 mm long, mostly conspicuously 3–nerved, glabrous, abruptly acute to more often obtuse at the apex; palea as long as or slightly longer than the lemma; anthers 0.8–1 mm long; caryopsis ellipsoidal, 0.6–1 mm long and to ca 0.5 mm wide. Known by several collections (e.g., Higgins 16693 BRY) from along roadsides in creosote bush communities in Washington County; native to South Africa, introduced into Arizona, New Mexico, Texas, and Oklahoma; 3 (0). Lehmann lovegrass is a readily established, drought-resistant grass introduced to the U. S. in 1932 for range seeding in warm semi-deserts of the Southwest (Hanson 1972). University of Arizona research has shown that this grass produces more forage with less water than any other known forage species (Thornburg 1982).

Eragrostis mexicana (Hornem.) Link Mexican Lovegrass. [*Poa mexicana* Hornem.; *E. orcuttiana* Vasey; *E.*

virescens Presl]. Annual; culms tufted, 4–10 dm tall, erect or geniculate and sometimes branching at the lower nodes, occasionally with a band of glandular tissue below the nodes; sheaths typically hairy at the summit, with or without glandular depressions; blades usually flat, gradually tapered from a broad base to a more or less filiform tip, (1) 2–17 mm wide and 5–25 cm long, usually scaberulous along the margins; ligule a ring of hairs; panicle open, ovoid to narrowly oblong, 15–40 cm long and to ca 14 cm wide, the primary branches naked near the base, the branchlets and pedicels smooth or scaberulous, ascending to ultimately widely spreading or occasionally reflexed, the pedicels shorter or longer than the spikelets; spikelets subterete to somewhat compressed, ovate to linear, 4- to 15-flowered, 4–9.5 mm long and 0.6–1.2 mm wide, pale green to dull gray green, occasionally purple, the rachilla remaining intact at fruiting; glumes subequal, 0.7–1.8 mm long, 1-nerved; lemma lanceolate, 1.5–2.2 mm long, 3-nerved, glabrous, acute; palea as long as the lemma or nearly so; anthers 0.3–0.5 mm long; caryopsis subpyriform to oblong, 0.6–1 mm long, flattened and shallowly to deeply grooved on the ventral side. Weed of gardens and waste places below 1520 m in Davis, Duchesne, Salt Lake, Uintah, and Utah counties; California and Nevada; disjunct in South America; 22 (vi). According to Koch and Sanchez (Phytologia 58: 377–381, 1985), our material is ssp. *virescens* (Presl) S. D. Koch & I. Sanchez V., differing from the typical element of the species in having spikelets less than 1.5 mm wide.

Eragrostis minor Host Minor Lovegrass. [*E. poaeoides* Beauv. ex R. & S.]. Annual; herbage with few to many craterlike glands; culms tufted, 0.3–4 (5) dm tall, erect or decumbent-based to prostrate, branching from the lower nodes, often with a ring of glands below the nodes; sheaths long-hairy at the summit, with or without craterlike glands; blades flat or folded, 1–5 mm wide and mostly 1–15 cm long, smooth or scaberulous and sometimes sparsely hairy, usually with craterlike glands along the margins; ligule a ring of hairs; panicle open, ovoid to narrowly oblong, mostly 2–15 cm long and to 10 (15) cm wide, the branches, branchlets, and pedicels ascending to widely spreading, the pedicels mostly 1–10 mm long, usually averaging more than 2 mm long, typically bearing 1 or more glands or bands of yellow glandular tissue, otherwise smooth or scaberulous; spikelets compressed, 5- to 12 (20)-flowered, 4–11 mm long and 1.5–2.2 mm wide, pale to dark gray green, often purple-tinged, the rachilla remaining intact at fruiting; glumes subequal, 1.2–1.8 mm long, 1-nerved, occasionally 1 or 2 glands on the midnerve; lemma usually slightly firmer than the glumes, broadly lanceolate to ovate, 1.3–2.2 mm long, glabrous or laterally scaberulous, 3-nerved, rarely with 1 or 2 obscure glands on the midnerve, subacute to rounded at the apex; palea at least 2/3 as long as the lemma; anthers 0.2–0.4 mm long; caryopsis globose to broadly ellipsoidal, 0.5–0.8 mm long, not ventrally grooved; $2n = 20, 22, 30, 40, 60$. Weed of gardens and waste places, mostly below 1520 m in Duchesne, Salt Lake, and Washington counties; native to Eurasia, adventive in Canada and in most of the southwestern U. S., established in much of the East; South America; 9 (iv). Proof that the generic name *Eragrostis* was validly published prior to the publication of the epithet *minor* necessitates rejection of the later name, *E. poaeoides* (Koch 1978). *Eragrostis lutescens* Scribn., reported from all of

the states surrounding Utah (Hitchcock 1951), differs from *E. minor* in being less robust (to 2 dm tall), with panicles narrow (the branches remaining appressed at maturity), and lemmas acute at the apex.

Eragrostis pectinacea (Michx.) Nees Tufted Lovegrass. [*Poa pectinacea* Michx.; *E. caroliniana* authors, not (Sprengel) Scribn.; *E. diffusa* Buckley]. Annual; culms tufted, 1–6 (10) dm tall, erect or decumbent-ascending, often branched at the base and occasionally above, lacking yellow glandular tissue below the nodes; sheaths hairy at the summit, otherwise glabrous; blades flat or folded, 0.5–4.5 mm wide and to 15 (30) cm long, glabrous or scaberulous; ligule a ring of hairs; panicle open, pyramidal or ovoid to narrowly oblong, 5–30 (35) cm long and to about 15 cm wide, the primary branches at maturity spreading or rarely reflexed, mostly naked near the base, the branchlets and pedicels smooth or scaberulous, remaining appressed to the branches; spikelets moderately compressed, 5- to 15 (22)-flowered, ovate to lanceolate, 4–11 mm long and (1) 1.2–2.5 mm wide, light green to dark gray green, sometimes purple-tinged, the rachilla remaining intact at fruiting; glumes 1-nerved, the first 1–1.5 mm long, the second 1.2–1.8 mm long; lemma lance-ovate, 1.5–2.2 mm long, 3-nerved, glabrous throughout or scabrous on the keel and often scaberulous laterally, acute; palea persistent, about equal to the lemma; anthers 0.2–0.4 mm long; caryopsis subglobose to oblong or subpyriform, mostly 0.6–1.1 mm long, not ventrally grooved; $2n = 40, 60$. Chiefly a weed of cultivated places, also occurring in moist, usually sandy sites along waterways and in waste places below 1520 m in Cache, Davis, Kane, Salt Lake, San Juan, Uintah, Utah, Washington, and Wayne counties; British Columbia to Nova Scotia, south throughout the U. S. and in Mexico; South America; sparingly introduced in western Europe; 28 (vii).

Eremopyrum (Ledeb.) Jaub. & Spach

Annuals; sheaths open or those of lowermost leaves initially closed to the summit or nearly so, usually bearing auricles; ligules membranous; inflorescence a short, dense, oblong to ovate spike, the rachis disarticulating throughout or only at its base, the internodes mostly to about 1 mm long; spikelets compressed, sessile, solitary at each node and alternating on opposite sides of the rachis, 3- to 6-flowered, the rachilla disarticulating above the glumes and between the florets or remaining intact; glumes firm, often fused at the base, 1- to 5-nerved, prominently keeled, usually asymmetrical, acute or awned; lemma leathery, lanceolate, keeled or rounded on the back, 5-nerved, acute or awned; stamens 3; caryopsis often adherent to the lemma and palea, the embryo not more than half the length of the grain; $x = 7$. In their native desert and semidesert habitats in Central Asia, these annual members of the tribe Triticeae have forage value only in early spring when large concentrations develop.

Eremopyrum triticeum (Gaertn.) Nevski Annual Wheatgrass. [*Agropyron triticeum* Gaertn.]. Annual; culms solitary or in small tufts, 4–40 cm tall, erect or geniculate at some of the nodes, densely puberulent below the spike; sheaths of culm leaves open about 2/3 their length, glabrous or puberulent, the uppermost typically inflated, the auricles small or lacking; blades soft, flat or loosely involute, 1–4 (6) mm wide, smooth or scabrous to

sparsely puberulent; ligule 0.2–1 mm long; spike ovate-elliptical, 0.8–2 cm long and to about 1.5 cm wide, the internodes of the rachis 0.2–1 mm long, the rachis ultimately disarticulating at its base, the spike falling intact; spikelets widely divergent, 6–10 mm long including awn tips; glumes becoming thickened and hardened, laterally compressed, lanceolate, 4–7 mm long, more or less saccate near the base of the broad keel, the margins membranous (often inrolled and appearing thickened), the apex acute to awn-tipped; lemma similar to or the upper portion thinner than the glumes in texture, lanceolate, 5–7.5 mm long, rounded on the back, glabrous or basally puberulent, awn-tipped or with an awn to 7 mm long; anthers to about 1 mm long; $2n = 14$. Disturbed sites in salt desert shrub, sagebrush, and juniper communities, mostly below 1520 m in Box Elder, Carbon, Emery, Grand, Juab, Salt Lake, San Juan, Tooele, and Uintah counties; native to central Asia, sparingly introduced from Alberta to Manitoba, south in the U. S. through most of the West; 28 (v).

Eriochloa H. B. K.

Annuals or sometimes perennials; culms often branching at the lower nodes; sheaths open; ligule an often obscurely membranous-based ring of hairs; inflorescence a contracted to open panicle, the spikelets sessile or short-pedicelled, solitary or in pairs in (1) 2 rows on erect to slightly spreading, one-sided, spike-like branches; spikelets dorsiventrally compressed, 2-flowered, the lower floret neuter or staminate, the upper perfect, the rachilla disarticulating near the base, the segment between the glumes expanded to form a cuplike structure, the first glume nearly always vestigial and adherent to the cuplike rachilla base, the second glume thin, about equal to the spikelet; lemma of the lower floret resembling the second glume, lemma of the upper floret leathery, obtuse to acute or short-awned; caryopsis free of but firmly enclosed within the lemma and palea, the embryo to ca 3/4 the length of the grain; $x = 9$.

Eriochloa contracta A. S. Hitchc. Prairie Cupgrass. [*Helopus mollis* C. Muell.]. Annual, often pubescent throughout with short soft hairs; culms branched at and often above the base, (2) 3–7 (8) dm tall, erect or geniculate and spreading; blades mostly 2–7 mm wide, flat to involute, ligule a dense ring of hairs 1–2 mm long; panicle 6–15 cm long, typically with 6–15 erect, slender, spike-like branches 1–2 cm long; spikelets 3.5–5 mm long including the awn tip; first glume vestigial (indistinguishable), second glume and lemma of the lower floret similar, as long as the spikelet, sparsely appressed-hairy, with awn tips to ca 1 mm long; lemma of the upper floret leathery, finely striate, obtuse at the apex and terminating in a scabrous, included awn 0.5–0.8 mm long; $2n = 36$. Known in Utah by a single collection (Higgins I6084 BRY) from a disturbed site at 950 m in the Mohave Desert extension into Washington County, Arizona, Colorado, Nebraska to Texas, Missouri, Louisiana, and Mexico; 2 (0).

Erioneuron Nash

Low, tufted annuals or perennials; leaves chiefly basal; sheaths open; blades narrow, flat to involute; ligule a ring of short hairs, sometimes membranous at the base; inflorescence a short, compact raceme or panicle; spikelets 4– to 18– flowered, disarticulating above the glumes and between the florets, the florets progressively reduced

upward, the uppermost sometimes rudimentary; glumes 1-nerved; lemma keeled to rounded on the back, entire or bilobed at the apex, 3-nerved, each nerve densely hairy at least below, the lateral nerves occasionally prolonged as short mucros, the midnerve as an awn-tip or a short awn; palea subequal to the lemma; stamens 3; caryopsis falling free of the lemma and palea, ovoid, translucent to opaque, smooth and glossy, the embryo about half as long as the grain; $x = 8$.

Tateoka, T. 1961. A biosystematic study of *Tridens* (Gramineae). Amer. J. Bot. 48: 565–573.

1. Inflorescence often partially enclosed by the subtending sheath and typically overtopped by the leaf blades; glumes as long as the spikelet or nearly so. . . . *E. pulchellum*
- Inflorescence borne above the blades; glumes much shorter than the spikelet. *E. pilosum*

Erioneuron pilosum (Buckley) Nash Hairy Tridens. [*Uralepis pilosa* Buckley; *Tridens pilosus* A. S. Hitchc.] Perennial with a few slender fibrous roots; culms densely tufted, erect or nearly so, 0.2–3 dm tall; sheaths usually hairy at the summit, otherwise glabrous; blades firm, flat or folded, 1–2 mm wide and mostly 1–6 cm long, typically sparsely short-hairy, the whitish margins thickened; ligule a ring of hairs, with or without a membranous base, the whole to about 0.5 mm long; panicle or raceme typically borne above the basal leaf cluster, ovate-oblong, 1–4.5 cm long; spikelets mostly 10–16 mm long with 6–12 (18) closely overlapping florets, pale or more often strongly purple-tinged; glumes ovate to lanceolate, sharply acute to awn-tipped, 3–6 (8) mm long overall, typically keeled on the solitary nerve, glabrous, the second glume about equal to the lowermost lemma; lemma ovate to lanceolate, 4–7.5 mm long, typically keeled, gradually tapered to an acute, entire to minutely notched apex, 3-nerved, the lateral nerves rimming the margin, the midnerve prolonged as an awn 0.2–2 mm long, the lemma body densely pubescent with hairs mostly 1–2 mm long on the nerves near the base and sometimes between, also pubescent along the margin to above mid-length or nearly throughout; anthers (of specimens examined) 0.2–1 mm long; $2n = 16, 32$. Creosote bush, desert shrub, sagebrush, and pinyon-juniper communities at 910 to 2130 m in Beaver, Emery, Garfield, Grand, Kane, Millard, San Juan, Tooele, Uintah, Washington, and Wayne counties; southwestern U. S. from California east to Kansas, Oklahoma, and Texas, south into Mexico; 94 (0).

Erioneuron pulchellum (H.B.K.) Tateoka Fluffgrass. [*Triodia pulchella* H. B. K.; *Tridens pulchellus* (H. B. K.) A. S. Hitchc.]. Perennial or in some areas chiefly annual or biennial, with or without slender stolons; culms densely tufted, 0.2–1.5 dm tall; leaves fasciated at each culm node; sheaths short and broad, typically hairy at the base and at the summit; blades firm, strongly involute and in that state to about 1 mm wide, rarely more than 6 cm long, pungent-tipped, more or less scabrous; ligule a ring of hairs with or without a membranous base, the whole about 0.5 mm long; panicle a headlike cluster mostly 1.5–4 cm long, subtended by multiple leaves, often partially enclosed in the sheaths and typically surpassed by the blades; spikelets mostly 6–13 mm long, pale or occasionally purple-tinged, (4) 5– to 8 (14)–flowered, the florets progressively reduced upward; glumes

broadly lance-elliptical, sharply acute to awn-tipped, 6–8 mm long overall, keeled to rounded on the back, usually glabrous throughout, the second equal to or slightly shorter than the uppermost lemma; lemma lanceolate, mostly 2.5–5 mm long, keeled to rounded on the back, lobed nearly to midlength, 3-nerved, densely long-hairy along the lateral nerves, sometimes almost to the apex, the midnerve prolonged as a glabrous awn nearly equal to or just surpassing the apical lobes, mostly 1–2.5 mm long, often recurved in age; anthers 0.3–0.5 mm long; $2n = 16$, 32. Creosote bush, desert shrub, sagebrush, and pinyon-juniper communities at 820 to 2130 m in Beaver, Emery, Garfield, Grand, Juab, Kane, Millard, San Juan, Washington, and Wayne counties; southwestern U.S. east to Texas and south into Mexico; 72 (0). According to Beatley (Madrono 20: 330–331. 1970), *E. pulchellum* has limited success in becoming established as a perennial where precipitation is variable from season to season. In such areas, most plants are annual or biennial and germinate following spring rains. *Erioneuron pulchellum* occasionally serves as host to what appears to be the same species of woolly aphid that commonly infests *Munroa squarrosa*. See *Blepharidachne kingii*.

Festuca L.

Annuals or perennials; sheaths open or the lowermost entirely to partially closed, with or without auricles; blades flat to involute; ligule membranous, often formed by the continuation of the membranous margin of the sheath summit across the ventral surface of the narrow blade, the lateral portion then usually higher than the center, ligules of the basal leaves sometimes longer than those of the culm leaves; inflorescence a contracted to open, erect to nodding, often more or less secund panicle or raceme, the branches and pedicels subterete to 3-angled, erect to widely spreading or reflexed, glabrous or scabrous to short-hairy; spikelets (1) 2- to 13 (20)-flowered, the upper 1–3 florets sometimes greatly reduced, the rachilla disarticulating above the glumes and between the florets; glumes mostly unequal, subulate to broadly ovate, the first 1 (3)-nerved and acute, the second usually subulate to lanceolate, 3 (5)-nerved, acute to short-awned, usually shorter but occasionally equal to or longer than the lowermost lemma; lemmas laterally or dorsiventrally compressed, lanceolate to ovate, mostly ultimately rounded on the back, 3- to 7-nerved, often obscurely so, gradually long-tapered from near midlength or below to an acute, rarely minutely bifid apex, awnless or with a straight to somewhat sinuous terminal awn; palea about equal to the lemma; stamens 3 in perennial species, 1–3 in annual ones; caryopsis free of or fused with the palea, bearing a very short apical appendage, the embryo 1/6–1/3 as long as the grain; $x = 7$. According to Lonard and Gould (1974), the separation of *Vulpia* from *Festuca* is based on a correlation between a primarily annual life form with the production of mostly cleistogamous flowers in *Vulpia*, versus a perennial life form with chasmogamous flowers in *Festuca*. European taxonomists, however, include in *Vulpia* some perennial species with chasmogamous flowers. Except for these overlapping characters, the two groups appear to be morphologically and cytologically inseparable. The morphological similarity between the annual species and the perennial *Festuca ovina*, for example, is greater than that between *F. ovina* and other perennial species of *Festuca*,

such as *F. sororia* or *F. subulata*. This close relationship between the annual and perennial species is totally obscured when each is placed in a separate genus. Under such circumstances, the rationale for assigning the annual species to *Vulpia* eludes me; and I have followed Hitchcock (1951), Dorn (1977), and Sutherland (1968) in recognizing only *Festuca*.

Lonard, R. T. and F. W. Gould. 1974. The North American species of *Vulpia* (Gramineae). Madrono 22: 217–230.
 Malik, C. P. 1967. Hybridization of *Festuca* species. Canad. J. Bot. 45: 1025–1029.
 Terrell, E. E. 1968. Notes on *Festuca arundinaceae* and *F. pratensis* in the United States. Rhodora 70: 564–568.

- 1. Leaf blades mostly flat, averaging more than 3 (2–12) mm wide 2
- Leaf blades flat to involute, averaging less than 3 mm (0.5–3) wide 5
- 2(1). Lemna awns averaging more than 4 (5–17) mm long *F. subulata*
- Lemmas awnless or with awns to 3 (4) mm long 3
- 3(2). Panicles open; sheath auricles lacking; spikelets with 1–4 well developed florets; plants of moist wooded areas, mostly at or above midmontane *F. sororia*
- Panicles narrow (branches often somewhat spreading at flowering); sheath auricles usually present; spikelets (4) 5- to 13-flowered; plants mostly occupying open sites below midmontane 4
- 4(3). Lemmas averaging less than 7 (4–7.5) mm long; leaf blades rarely more than 7 (2–9) mm wide; auricles typically glabrous; panicle branches 2 at the lowermost node, together rarely bearing more than 9 spikelets *F. pratensis*
- Lemmas usually averaging at least 7 (6–10) mm long; leaf blades 2–12 mm wide; auricles typically ciliate; panicle branches 2 or 3 at the lowermost node, together usually bearing 10–30 spikelets *F. arundinacea*
- 5(1). First glume 0.3–1.5 (2) mm long; awns of the lemmas 5–22 mm long *F. myuros*
- First glume more than 2 mm long or rarely shorter and then awns of the lemmas averaging less than 5 (0.5–6) mm long 6
- 6(5). Ligule 2.5–9 mm long; plants 4–12 dm tall, occupying montane habitats *F. thurberi*
- Ligule less than 2.5 mm long; plants mostly less than 4 dm tall, rarely montane 7
- 7(6). Plants annual; stamens 1–3. 8
- Plants perennial; stamens consistently 3 10
- 8(7). Spikelets at maturity 5- to 17-flowered, the internodes of the rachilla averaging about 0.5 (0.3–1) mm long; lemma glabrous to pubescent with minute, stiffly spreading hairs, the awn 0.5–5 (6) mm long *F. octoflora*
- Spikelets 2- to 4 (8)-flowered, the internodes of the rachilla averaging 1 mm long; lemma glabrous or scabrous, the awn 3–20 mm long 9
- 9(8). Pedicels and usually the branches of the panicle erect and remaining so at maturity, pulvini generally lacking in the axils; pedicels averaging more than 2 (1–6 or more) mm long; glumes glabrous *F. bromoides*
- Pedicels and usually the branches (at least the lowermost) widely spreading to reflexed at maturity, pulvini usually present in the axils; pedicels averaging less than 2 (0.5–6) mm long; glumes sometimes hairy *F. microstachys*

- 10(7). Spikelets 1- or 2 (3)-flowered; panicles ultimately open, the branches widely spreading to reflexed, distinctly pubescent (at 10x magnification) . . . *F. dasyclada*
- Spikelets (2) 3- to 10-flowered; panicles mostly narrow, the branches spreading only at flowering, glabrous to scabrid-puberulent 11
- 11(10). Plants densely tufted, lacking rhizomes, occupying native habitats or rarely escaping from cultivation; leaves chiefly basal, numerous, the blades filiform, averaging about 1 (0.3-2) mm wide *F. ovina*
- Plants solitary or loosely tufted, usually decumbent-based and rhizomatous, in cultivation or escaped therefrom; leaves basal and cauline, few, the blades often flat, 0.5-3 mm wide *F. rubra*

***Festuca arundinacea* Schreber Tall Fescue.** [*F. elatior* ssp. *arundinacea* Hackel]. Differs from *F. pratensis* chiefly in being more robust, with culms 0.5-2 m tall, sheath auricles ciliate or rarely glabrous, leaf blades (2) 3-12 mm wide, panicle to 35 cm long, spikelets mostly 12-15 mm long, first glume (3) 4-6 mm long, second glume 4-7 mm long, and lemmas (6) 7-10 mm long; $2n = 28, 42, 56, 63, 70$. Along roadways, in salt desert shrub, sagebrush, and meadow communities, and as a weed of cultivated areas, at 1280 to 1830 m in Davis, Duchesne, Garfield, Morgan, Salt Lake, Tooele, Utah, and Wayne counties; native to Europe, now cultivated from Alaska through southern Canada and much of the U. S., escaping and becoming widely established; South America; 16 (viii). The characters by which Terrell (Rhodora 70: 564-568. 1968) separates *F. arundinacea* from *F. pratensis* (as listed in part in the key) occur at random in more than half the specimens examined. Although the genomic constitution of the cultivar growing in our area may have been altered through selective breeding, both morphological and seed protein studies indicate that in natural populations *F. pratensis* and *F. arundinacea* do retain independent specific status (Pl. Syst. & Evol. 149: 135-140. 1985). The name *F. arundinacea* is retained here following European, Asian, and nearly all American workers. Tall fescue is valuable for pasture, hay, and erosion control on irrigated sites or in areas receiving a mean annual precipitation of about 46 cm or more. The grass is salt-tolerant and does well on heavy alkaline soils of low-lying valleys where it has been widely used in recent years. It also produces good forage yields in mountain meadows and in openings in aspen-conifer woodlands, especially when planted in pure stands (Vallentine 1961). Unfortunately, the plant is a noxious invader of lawns. Moreover, ingestion of large amounts of tall fescue may lead to lameness and ultimately gangrene of one or both hind feet in susceptible cattle (Kingsbury 1964).

***Festuca bromoides* L. Brome Sixweeks Fescue.** [*F. dertonensis* (All.) Asch. & Graebn.; *Vulpia bromoides* (L.) S. F. Gray]. Annual; culms solitary or in small tufts, 0.5-6 dm tall, usually erect; sheaths glabrous or short-hairy, without auricles; blades usually involute, 0.5-2.5 mm wide, glabrous or hairy; ligule 0.2-0.6 mm long; panicle (rarely a raceme) narrow, 1-15 cm long, the short branches erect to slightly spreading, pulvini usually lacking in branch axils, pedicels 1-6 mm or longer, remaining appressed; spikelets 2- to 4 (7)-flowered, 6.5-11.5 mm long (excluding awns), the internodes of the rachilla usually at least 1 mm long; glumes subequal to unequal, glabrous, acute to minutely awned at the tips, the first 2.5-5 (6) mm long, the second 4.5-7 mm long, slightly

shorter to longer than the body of the lowermost lemma; lemma ultimately rounded on the back, (4) 5-8 (9) mm long, glabrous or scabrous, long-tapered to an awn 3-12 mm long; stamens 1-3, the anthers 0.2-3 mm long; $2n = 14, 42$. Dry, disturbed sites at 1310 to 1830 m in Cache, Millard, Salt Lake, and Washington counties; native to Eurasia, introduced in British Columbia and along the west coast of the U. S. to northern Mexico, infrequent eastward; South America; 5 (0). *Festuca bromoides* closely resembles and is possibly not specifically distinct from *F. microstachys*.

***Festuca dasyclada* Hackel ex Beal Utah Fescue.** [*Argillochloa dasyclada* (Hackel ex Beal) W. A. Weber]. Tufted perennial; culms erect to curved-ascending, 1.5-4 dm tall; sheaths as in *F. ovina*; blades 0.5-2 mm wide, folded to involute, glabrous or more often minutely hairy; ligule to ca 1 mm long; panicle ultimately open, to ca 12 cm long, branches mostly solitary or in pairs, the branches and pedicels ultimately widely spreading to abruptly reflexed, distinctly pubescent (at 10x magnification), the pedicels about equal to or slightly longer than the body of the lemma; spikelets 1- or 2 (3)-flowered, 5-7 (8) mm long; glumes unequal, long-tapered to sharply acute tips, the first subulate to narrowly lanceolate, 2.6-4.5 mm long, the second lance-elliptical, (4.5) 5-7 mm long, often scaberulous, shorter than the lowermost to as long as the second floret; lemmas mostly rounded on the back, (4) 5-6 mm long, scabrous to scabrid-puberulent, 5-nerved, the midnerve prolonged as an awn 1-5 mm long; palea about equal to the lemma, the 2 nerves prolonged as minute bristles; stamens 3, the anthers 1.5-2 mm long; $2n = 28$. Chiefly in sagebrush, mountain brush, and juniper communities at 2130 to 3048 m in Emery (type from Joes Valley), Garfield, Sanpete, and Wasatch counties; western Colorado; 19 (0). Weber (Phytologia 55: 1-2. 1984) places *F. dasyclada* in a newly erected monotypic genus (*Argillochloa*), stating that the taxon differs strikingly from *Festuca* by its rigidly divaricate secondary branches with pulvini in the axils. Widely spreading secondary branches with pulvini also occur in *F. thurberi*, *F. subulata*, and *F. sororia*. The pulvini-based branches of *F. microstachys* are stiffly spreading to reflexed at maturity. Other features cited by Weber as unusual are the long second glume (present in *F. bromoides* and one variety of *F. ovina*), the 2-flowered spikelets (occurring in some forms of *F. microstachys* and *F. ovina*), and the nonsecund nature of the inflorescence (found in *F. subulata*, *F. thurberi*, and other perennial species of *Festuca*). I find that *Festuca dasyclada* is a distinctive species but is well within the generic circumscription of *Festuca*. *Festuca dasyclada* is one of four species of *Festuca* endemic to the western U. S.

***Festuca microstachys* Nutt. Small Fescue.** [*F. arida* Elmer; *F. pacifica* Piper; *F. reflexa* Buckley; *Vulpia microstachys* (Nutt.) Benth.]. Annual; culms solitary or in small tufts, 0.5-4 (6) dm tall, usually erect; sheaths glabrous or pubescent, without auricles; blades mostly involute, rarely as much as 1.5 mm wide; ligule 0.2-1 mm long; panicle (rarely a raceme) initially narrow, open at maturity, 3-13 cm long, pedicels 0.5-6 mm long, mostly less than 2 mm long, the branches and pedicels at first erect, pulvini forming in axils, the pedicels and at least the lower branches ultimately spreading to reflexed; spikelets 1- to 6-flowered, the internodes of the rachilla usually at least 1 mm long; glumes mostly unequal, acute

to minutely awnlike at the tips, glabrous or pubescent, the first 1.7–5.5 mm long, the second 3.5–7.5 mm long, equal to or more often shorter than the body of the lowermost lemma; lemma ultimately rounded on the back, (3.5) 4–8 mm long, glabrous or scabrous to pubescent, long-tapered to an awn (3) 6–20 mm long; stamens 1–3, the anthers 0.2–3 mm long; $2n = 28$. Along waterways and roadsides and on dry open slopes below 1830 m in Washington County; British Columbia, south through most of the western U. S. and into Mexico; 8(i). Lonard and Gould (1974) recognize four varieties as comprising *F. microstachys* (as *Vulpia microstachys*) based on variations in the indument of the spikelets. Utah plants, with spikelets glabrous or scabrous, are referred by them to var. *pauciflora* Scribn. ex Vasey, the most common element within the species, occurring throughout its range. See *F. bromoides*.

Festuca myuros L. Myur Fescue. [*F. megalura* Nutt.; *Vulpia myuros* (L.) C.C. Gmel.]. Annual; culms solitary or in small tufts, 0.8–7 dm tall, usually erect; sheaths glabrous or rarely the lowermost puberulent, without auricles; blades involute or folded, 0.5–3 mm wide; ligule 0.2–0.6 mm long; panicle narrow, often rather dense, 3–25 cm long, the branches mostly erect to strongly ascending; spikelets 3– to 5 (8) -flowered; glumes unequal, the first 0.3–1.5 (2) mm long, the second 2.5–6.5 mm long, at least twice as long as the first, shorter than the body of the lowermost lemma; lemma typically rounded on the back, 4.5–7.5 mm long, usually scabrous, at least toward the apex, sometimes ciliate on the narrowly membranous, ultimately inrolled margins, long-tapered to an awn 5–22 mm long; stamens 1–3, the anthers 0.2–1.5 mm long; $2n = 14, 42, 63$. Dry to moist sites, saline meadows and salt desert shrub communities, on open slopes and along roadsides, chiefly below 1830 m in Davis, Salt Lake, Tooele, Utah, Washington, and Weber counties; native to Eurasia, now circumboreal, south throughout most of the western U. S., east in most of the coastal states from Texas to Maine, and in Mexico; South America; 7(i). *Festuca megalura* was long thought to be native to North America and distinct from the closely related European introduction, *F. myuros*, in having ciliate lemmas. Plants with ciliate lemmas also occur in Europe, however, where they are referred to a variety of the species. In our area, ciliate and non-ciliate lemmas occur on plants within the same population and even within a single panicle, rendering formal recognition of the variation of doubtful significance. A cultivar of myur fescue (foxtail fescue), because of its extensive fibrous root system and excellent seedling vigor, is proving valuable in controlling erosion in areas with a mean annual precipitation as low as 25 cm (Thornburg 1982).

Festuca octoflora Walter Sixweeks Fescue. [*F. octoflora* var. *hirtella* (Piper) Henrard; *Vulpia octoflora* (Walter) Rydb.]. Annual; culms solitary or in small tufts, 0.2–3 (6) dm tall, erect or occasionally geniculate at the lower nodes; sheaths glabrous or retrorsely puberulent, without auricles; blades involute, to ca 1.3 mm wide; ligule 0.2–1 mm long; panicle 1–10 (20) cm long, the short branches mostly erect-appressed; spikelets 5– to 15 (17) -flowered, the internodes of the rachilla 0.3–1 mm long, averaging ca 0.5 mm long; glumes unequal, the first subulate to narrowly lanceolate, (1.7) 2–5.5 mm long, acute, the second lance-elliptical, 3.5–7 mm long, acute or with an awn tip mostly less than 1 mm long, the whole

shorter than the body of the lowermost lemma; lemma ultimately rounded on the back, 2.7–7 mm long, glabrous or scabrous to pubescent with stiffly spreading hairs, narrowly or not at all membranous on the ultimately inrolled margins, long-tapered to an awn 0.5–5 (6) mm long, the awn rarely longer than the body of the lemma; stamens 1–3, the anthers 0.2–0.7 (1.3) mm long; $2n = 14$. Salt desert shrub, creosote bush, desert shrub, pinyon-juniper, and sagebrush communities, occasionally on grassy slopes and in association with *ponderosa* pine, at 760 to 2290 m in Beaver, Box Elder, Cache, Daggett, Davis, Emery, Garfield, Grand, Iron, Juab, Kane, Millard, Piute, Salt Lake, San Juan, Sanpete, Sevier, Tooele, Uintah, Utah, Washington, Wayne, and Weber counties; British Columbia to Quebec, south throughout the U. S., and in Mexico; 115 (v). Plants with glabrous or slightly scabrous lemmas have been referred to var. *octoflora*, those with scabrid-puberulent to distinctly hairy lemmas to var. *hirtella* (Piper) Henrard. The extremes are not geographically segregated, however, and do in fact occur within a single population and even on the same plant.

Festuca ovina L. Sheep Fescue. [*F. arizonica* Vasey; *F. brachyphylla* Schultes; *F. brevifolia* R. Br.; *F. brevifolia* var. *utahensis* St. Yves (type from Alta, Salt Lake County); *F. calligera* (Piper) Rydb.; *F. idahoensis* Elmer; *F. saximontana* Rydb.]. Tufted perennial; herbage bright green to glaucous; culms 0.2–11 dm tall, erect to rarely decumbent at the base, sometimes rooting at subsurface nodes and appearing short-rhizomatous; leaves chiefly basal, usually numerous and filiform, strongly ascending, rarely more than half the length of the culm (except in var. *brevifolia*); sheaths glabrous to minutely hairy, the outer sheath bases (sometimes missing in herbarium specimens) closed to the summit, mostly brown, thin, and soon shredding, the inner sheath bases open, often to the base or nearly so, pale to dark gray, opaque and persistent, typically broader than the blade, the margins narrowly membranous and usually overlapping, lacking auricles (sheath margins occasionally slightly prolonged at the summit and resembling auricles); blades folded or involute and in that state mostly 0.2–1 mm wide, rarely flat and then to 1.5 (2) mm wide, smooth or scabrous to minutely hairy; ligule ranging from a mere ridge to 1.5 (2) mm long, higher on the sides than in the center; panicle 1–12 (15) cm long, often more or less secund, the short branches scabrous to scabrid-puberulent, erect to strongly ascending or at flowering widely spreading to reflexed; spikelets (2) 3– to 7 (9) -flowered, 3–12 (14) mm long, green or purple-tinged; glumes narrowly to broadly lanceolate, glabrous throughout or scabrous to scabrid-puberulent, especially distally, the first 1.5–4.5 mm long, the second 2.5–5.5 (6) mm long, shorter than (or in var. *brevifolia* sometimes equal to) the body of the lowermost lemma; lemma laterally to dorsiventrally compressed, rounded on the back to slightly keeled toward the apex, 3–7 mm long, 3– to 5-nerved, often obscurely so, glabrous or distally scabrous to minutely hairy, the narrow membranous margins ultimately curved around the palea, the apex long-tapered to an awn 0.5–4 (5) mm long; stamens 3, the anthers 0.5–4 mm long; $2n = 14, 21, 28, 35, 36, 42, 44, 49, 56, 70$. Often the dominant grass, occupying mostly mesic sites, chiefly in sagebrush, aspen-spruce-fir, *ponderosa* pine, lodgepole pine, and montane grass communities, and on exposed rocky slopes and ridges, occasionally with pinyon-juniper and moun-

tain brush, at 1950 to 3960 m, rarely an escape from cultivation at lower elevations, in all Utah counties except Morgan; circumboreal, south in the U. S. throughout the West, in the Great Plains, the Northeast, and in Mexico; South America and Eurasia; 431 (xiii). *Festuca ovina* is a widespread polymorphic grass with many habitat-related forms, some of which have been treated as species on the basis of quantitative characters that form a continuum of variation. The robust forms referred to *F. idahoensis* and *F. arizonica* by Hitchcock (1935) were first described as varieties of *F. ovina* by Beal (Grasses of North America, 1896). Gould and Shaw (1983) and Cronquist et al. (1977) concede that the two forms can with reason be treated at the varietal level. The following key permits assignment to varietal status of some of the more commonly occurring native forms, although the many intermediate plants will not satisfactorily fit into any category.

1. Culms mostly more than 4 dm tall; panicles typically more than 7 cm long; spikelets 8–14 mm long 2
- Culms 0.2–4 (5) dm tall; panicles rarely more than 7 cm long; spikelets 4–8 (9) mm long 3
- 2(1). Awn of the lemma usually less than 1 mm long; plants reported from Navajo Mt. in San Juan County, occurring in dry meadows or in openings in aspen-fir (*F. arizonica*) *F. ovina* var. *arizonica* Hackel ex Beal
- Awn of lemma usually at least 1 mm long; widespread, plants of foothills to subalpine, often in sagebrush-grass communities (*F. idahoensis*) *F. ovina* var. *ingrata* Hackel ex Beal
- 3(1). Culms over 2.5 dm tall, at least twice the height of the basal leaves; anthers more than 1 mm long; plants of foothills to alpine *F. ovina* var. *rydbergii* St. Yves
- Culms 0.2–2.5 dm tall, usually less than twice the height of the basal leaves; anthers to 1 mm long; plants of subalpine and alpine (*F. brachyphylla*) *F. ovina* var. *brevifolia* (R. Br.) Wats.

Native strains of *F. ovina* are an important source of forage and will thrive in areas with a mean annual precipitation from 20–36 cm (Thornburg 1952). Commercial strains used for turf and for erosion control have been developed from plants originating in Europe, e.g., var. *ovina* and var. *duriuscula* (L.) Koch. They are adapted to areas receiving mean annual precipitation of approximately 36 cm or more. Blue fescue, a low, usually strongly glaucous form of *F. ovina* grown for ornament, is generally referred to var. *glauca* Koch.

Festuca pratensis Hudson Meadow Fescue. [*F. elatior* L., nom. ambig.]. Tufted perennials; culms rarely more than 1 m tall, erect to basally curved-ascending, sometimes rooting at the lower nodes and appearing to be short-rhizomatous; sheaths mostly open, the outermost often dark and soon shredding, auricles usually present, glabrous or rarely minutely ciliate; blades (2) 3–9 mm wide, flat to occasionally involute, smooth or more often scabrous; ligule 0.2–1 (2) mm long; panicles mostly 6–20 cm long, erect or somewhat nodding, the branches erect or at flowering spreading, often spikelet-bearing throughout their length or nearly so; spikelets (4) 5– to 13-flowered, 10–15 (17) mm long; glumes subequal or unequal, lanceolate, acute, the first 2.5–4 mm long, 1– to 3-nerved, the second 3.5–5 mm long, 3– to 5-nerved, shorter than the body of the lowermost lemma; lemma laterally or dorsiventrally compressed, lanceolate to elliptical, (4) 5–7 (7.5) mm long, more or less obscurely 5–

7-nerved, smooth or somewhat scabrous, membranous-margined, acute or with an awn to 3 (4) mm long; stamens 3, the anthers 1.5–3.5 mm long; $2n = 14, 28, 42, 70$. Moist to dry sites, chiefly along roadsides and waterways, in meadows, fallow fields, and other disturbed sites, occasionally in aspen-spruce-fir, ponderosa pine, and lodgepole pine communities and on open slopes, at 1310 to 2900 m in all but Morgan and Piute counties; native to Eurasia, introduced in Canada and throughout most of the U. S.; South America; 105 (v). *Festuca pratensis* readily hybridizes with *Lolium perenne*. The sterile progeny of such a cross, described as having short-pedicelled spikelets and rudimentary first glumes, are referred to *x Festulolium loliaceum* (Hudson) P. Fourn. (Tutin et al. 1980). Meadow fescue (Hanson 1972) is used as a pasture grass and for erosion control in the humid parts of the northern U. S., but it is neither as high in yield nor so persistent as *F. arundinacea* (q.v.).

Festuca rubra L. Red Fescue. *Festuca rubra* differs from *F. ovina* chiefly in nearly always having rhizomes. Our few specimens also differ from the strongly tufted *F. ovina* in having more or less conspicuously hairy sheaths, leaf blades mostly flat and 0.5–1.5 (3) mm wide, and spikelets from 7.5–17 mm long. These distinctions may represent a habitat-related extreme of variation; or they may be the product of selective breeding, since in Utah this combination of characters apparently exists only in plants under cultivation or escaped therefrom; $2n = 14, 21, 28, 42, 46, 49, 53, 56, 64, 70$. Cultivated as a lawn grass, rarely escaping, reported from Cache, Salt Lake, Summit, Utah, and Washington counties; native races circumboreal, south through the U. S., except in the Great Plains, the Southeast, and parts of the Southwest; South America; 13 (iii).

Festuca sororia Piper Ravine Fescue. Perennial; culms loosely tufted, 4–10 dm tall, erect or basally curved-ascending, sheaths glabrous, otherwise as in *F. ovina*; blades thin, flat, 2.5–7 mm wide, glabrous or scaberulous; ligule to 1 (1.5) mm long; panicle loose to open, 1–2 dm long, usually nodding, the branches solitary or in pairs, in some plants to 8 cm or more long, ultimately widely spreading to reflexed, scabrous, spikelet-bearing over the distal 1/2–2/3; spikelets 2– to 4 (5) -flowered, 8–11 mm long; glumes unequal, long-tapered to sharply acute tips, the first subulate to narrowly lanceolate, 2–4 mm long, the second lanceolate, 3.5–5.5 mm long, shorter than the lowermost lemma; lemma rounded on the back to more or less laterally compressed, 6–8 (8.5) mm long, with 3–5 evident nerves, scaberulous or nearly smooth, long-tapered to an acute or awn-tipped apex; stamens 3, the anthers 1.5–2.5 mm long. Spruce-fir communities in more or less dense shade at 2440 to 3050 m in Emery, Iron, San Juan, and Utah counties; Arizona, New Mexico, and Colorado; 7 (0).

Festuca subulata Trin. Bearded Fescue. [*F. jonesii* Vasey, type from Salt Lake County]. Perennial; culms in mostly small, loose tufts, 5–10 dm tall, erect or curved-ascending near the base, often rooting at the lowermost nodes, occasionally stoloniferous; leaves chiefly cauline; sheaths glabrous or scaberulous, otherwise as in *F. ovina*; blades thin, flat, 3–10 mm wide, smooth or scaberulous; ligule to ca 1 mm long; panicle loose to open, 10–40 cm long, frequently nodding, the branches 1–5 (6) per node, often to 8 cm or more long, ultimately widely spreading to occasionally abruptly reflexed, scabrous or glabrous,

mostly spikelet-bearing over the distal 1/2–2/3; spikelets usually with 1–4 perfect florets below 1–3 partially developed to vestigial ones, (6) 7–9 (10) mm long; glumes unequal, sharply acute to awn-tipped, the first subulate, 1.5–4 mm long, the second subulate to narrowly lanceolate, 2–6 mm long, shorter than the body of the lowermost lemma; lemma rounded to keeled on the back, 4–7 mm long, mostly 3–nerved, glabrous or scaberulous, long-tapered to a slender awn (4) 5–17 mm long; stamens 3, the anthers 1.1–3 mm long; 2n = 28. Mesic to moist sites, usually in dense shade within maple-aspens, aspen-mountain brush, and aspen-spruce-fir communities at 1680 to 2320 m in Cache, Davis, Salt Lake, and Utah counties; Alaska to Alberta, south to California, east to Idaho, Montana, and Wyoming; 28 (viii).

Festuca thurberi Vasey Thurber Fescue. [*Poa festucoides* Jones, type from Mt. Ellen, Henry Mts.]. Tufted perennial; culms erect, relatively stout, 4–9 (12) dm tall; sheaths glabrous or obscurely scabrous, without auricles, the persistent old bases loose, opaque, and often conspicuous; blades firm, involute or rarely flat, to ca 2 mm wide, glabrous or scabrous on the lower surface, minutely hairy above; ligule 2.5–8 (9) mm long; panicle loosely contracted to open, 8–17 cm long, frequently nodding, the branches mostly solitary at each node, to 8 cm or more long, ultimately widely spreading, scabrid-puberulent to minutely hairy, mostly spikelet-bearing over the distal 1/2–2/3; spikelets 3– to 6 (7) –flowered, (8) 10–14 mm long, terete to somewhat compressed; glumes usually subequal, narrowly to broadly lance-elliptical, 3–5.5 mm long, broadly membranous-margined, sharply acute to obtuse at the apex, shorter than the lowermost lemma; lemma lance-elliptical, 6–10 mm long, rounded to somewhat keeled on the back, 5–nerved, often conspicuously so, glabrous or scaberulous, acute to minutely awn-tipped; stamens 3, the anthers 1.5–4.5 mm long; 2n = 28, 42. Mesic to moist sites, chiefly in dense shade within aspen-spruce-fir communities, occasionally in sagebrush-grass, mountain brush, ponderosa pine, and meadow communities, and on open slopes, at 2130 to 3350 m in Emery, Garfield, Grand, San Juan, Sevier, Uintah, Utah, and Wayne counties; Wyoming, Colorado, New Mexico, and Arizona; 63 (i). Thurber fescue is a palatable grass that may ultimately prove valuable for range seeding.

Glyceria R. Br.

Perennials; culms erect to prostrate; sheaths closed throughout or over at least 2/3 the length, the lowermost often cross-veined; blades flat to loosely involute; ligule membranous; inflorescence a narrow to open, erect to nodding panicle or raceme; spikelets linear to ovoid, flattened or subterete, 3– to 15 (20) –flowered, disarticulating above the glumes and between the florets; glumes unequal, ovate to lanceolate, shorter than the lowermost lemma, 1–nerved; lemmas broadly ovate or obovate to lance-elliptical, rounded to somewhat flattened on the back, with 7–9 usually prominent parallel nerves, obtuse to acutish apically; palea shorter to slightly longer than the lemma; stamens 2 or 3; caryopsis free of the lemma and palea, narrowly to broadly ovoid to obovate, the embryo 1/5–2/5 as long as the grain; x = 10.

- 1. Lemmas 3.3–4 mm long; spikelets linear (except at flowering), 9–15 (18) mm long *G. borealis*

- Lemmas 1.4–3 mm long; spikelets ovate to oblong, to 5 mm long 2
- 2(1). Second glume 3–nerved; sheaths open throughout; lemmas mostly truncate at the broadly membranous apex *Puccinellia pauciflora*
- Second glume 1–nerved, sheaths closed nearly to the summit; lemmas obtuse to rounded at the firm or narrowly membranous apex 3
- 3(2). Lemmas membranous-margined and broadest at the apex, 1.4–2.3 mm long *G. striata*
- Lemmas firm throughout, broadest at midlength or below, 2–2.8 mm long *G. grandis*

Glyceria borealis (Nash) Batch. Northern Mannagrass. [*Panicularia borealis* Nash]. Rhizomatous perennial; culms 6–15 dm tall, erect or decumbent at the base; sheaths often open 1–4 cm below the summit, glabrous; blades flat or folded, 2–7 mm wide, glabrous throughout or scaberulous to papillose on the upper surface; ligule 4–12 mm long; panicle usually narrow and erect, 2–4 (5) dm long, the primary branches relatively few and widely spaced, to ca 13 cm long, appressed to the main axis or occasionally more or less spreading, the spikelets borne on slender, mostly appressed pedicels; spikelets linear and subterete (lemmas spreading at flowering), 9–15 (18) mm long, 8– to 12–flowered; glumes lance-elliptical to oblanceolate, obscurely nerved, broadly membranous-margined, acute to rounded at the apex, the first 1.1–2.2 mm long, the second 2.2–3.5 mm long, shorter than the lowermost lemma; lemma lance-elliptical, 3.3–4 mm long, rounded or more or less flattened on the back, prominently (5) 7–nerved, green or tawny, obscurely scaberulous on the nerves, otherwise essentially glabrous, broadly membranous and often erose at the acute to rounded apex; palea slightly shorter than the lemma; stamens 3, the anthers 0.5–0.8 mm long; 2n = 20. Wet places, occasionally partially submersed, in meadows, streamside, along lake margins, and in areas of ground-water seepage in mountain brush, aspen-spruce-fir, and lodgepole pine communities at 1890 to 3140 m in Duchesne, Garfield, Iron, San Juan, Sevier, Summit, Uintah, and Utah counties; Alaska to Newfoundland, south in the U. S. throughout most of the West, and from the Dakotas to Maine, south to Illinois and Pennsylvania; 36 (0).

Glyceria grandis Wats. ex Gray American Mannagrass. [*G. maxima* ssp. *grandis* (Wats.) Hulten; *Panicularia grandis* (Wats.) Nash]. Rhizomatous perennial; culms 5–20 dm tall; sheaths closed throughout or nearly so, glabrous or scaberulous; blades flat to loosely involute, 4.5–12 (15) mm wide, glabrous or scaberulous; ligule (2) 4–9 mm long; panicle ultimately open, 2–4 dm long, the branches often drooping; spikelets mostly oblong, 4–6.5 mm long, 4– to 9–flowered; glumes membranous, pale, elliptical to ovate, acute at the apex, the first 1.2–2 mm long, the second 1.5–2.5 mm long, shorter than the lowermost lemma; lemma elliptical to ovate, 2–2.8 mm long, rounded on the back, prominently (5) 7–nerved, typically purple or purple-tinged, obscurely scaberulous, gradually tapered from about midlength to the obtuse, firm, usually entire apex; palea mostly equal to or slightly longer than the lemmas; stamens (2) 3, the anthers 0.5–0.9 mm long; 2n = 20. Wet sites, occasionally partially submersed, along waterways, in meadows, and in areas of ground-water seepage at 1310 to 2440 m in

Cache, Duchesne, Morgan, Piute, Rich, Salt Lake, Summit, Uintah, Utah, Wasatch, and Weber counties; Alaska to Nova Scotia, south in the U. S. through most of the West, and from the northern Great Plains to Maine, south to Tennessee; sparingly introduced in northern Europe; 47 (ii). *Glyceria grandis* is a link in a circumboreal chain of very closely related taxa and was for a time reduced by Hulten (*Flora of Alaska* 1968) to infraspecific status under the Eurasian *G. maxima* (Hartman) Holmberg. Our material differs from *G. maxima*, however, in having smaller anthers, smaller, less acute glumes, and smaller lemmas that are firm throughout rather than membranous at the tip.

Glyceria striata (Lam.) A. S. Hitchc. Fowl Manna-grass. [*Poa striata* Lam.; *G. elata* (Nash) Jones; *G. striata* var. *stricta* (Scribn.) Fern.; *Panicularia elata* Nash; *P. nervata* (Willd.) Kuntze]. Rhizomatous perennial; culms (1.5) 3–10 (15) dm tall, erect or decumbent at the base; sheaths closed throughout or nearly so, glabrous or scabrous; blades flat to loosely involute, (1) 2–10 (12) mm wide, glabrous or scaberulous; ligule 1–4 (6) mm long; panicle open, 0.5–3 dm long, the branches usually drooping; spikelets ovate to oblong, 2–4 (5) mm long, 3- to 7-flowered; glumes membranous except along the midnerve, pale or purple-tinged, mostly lance-elliptical to obovate, obtuse to rounded and usually erose at the apex, the first 0.4–1.3 mm long, the second 0.7–1.5 mm long, shorter than the lowermost lemma; lemma obovate, 1.4–2.3 mm long, rounded on the back, prominently 7- to 9-nerved, green or purple-tinged, scaberulous, broadest near the rounded, narrowly membranous, often erose apex; palea mostly equal to or longer than the lemma; stamens 2, the anthers 0.3–1 mm long; $2n = 20, 28$. Wet meadows and in other moist sites in aspen-spruce-fir, ponderosa pine, and lodgepole pine communities, chiefly between 1220 and 3200 m in all but Carbon County; Alaska to Newfoundland, south throughout the U. S. and in Mexico; introduced in Europe; 267 (xv). *Glyceria striata* ranges across the entire North American continent, exhibiting considerable variation, particularly in the height of the culm and width of blades. In the western states, robust forms have been referred to *G. elata* and those less robust to *G. striata*. Plants referred to *G. elata* in the West, however, are identical to what is called *G. striata* var. *striata* in the East. Moreover, characters traditionally used to separate two taxa are quantitative, overlapping, and by no means consistently correlated. Under these circumstances, formal recognition of more than one entity appears unwarranted.

Helictotrichon Besser

Tufted perennials; sheaths open to at least midlength; blades flat to involute; ligule membranous; inflorescence a more or less narrow panicle; spikelets large, subterete, 2- to 7-flowered, the lower 1–4 perfect, the upper 1–4 neuter, the rachilla long-hairy, disarticulating above the glumes and usually between the florets; glumes lanceolate, broadly membranous-margined, 1- to 5-nerved; lemma lanceolate, firmer than the glumes, membranous-margined and often cleft at the apex, keeled to rounded on the back, 5- to 7-nerved, at least that of the lower lemma awned from about midlength, the awn stout, geniculate, the lower portion terete and twisted; palea shorter than the lemma; stamens 3; caryopsis free of but enclosed within the lemma and palea, the embryo not more than 1/3 as long as the grain; $x = 7$.

Helictotrichon mortonianum (Scribn.) Henrard Alpine Oat. [*Avena mortoniana* Scribn.]. Perennial; culms densely tufted, 0.5–2 dm tall; sheaths open; ligule membranous, to about 1 mm long; blades usually involute and in that state mostly less than 1 mm wide; panicle narrow, compact to loose, 2–7 cm long, the branches short, erect or nearly so; spikelets (1) 2 (3)-flowered, 7–12 mm long, typically solitary at the tip of each branchlet, the lower floret perfect, the upper 1 (2) typically reduced and neuter, the rachilla long-hairy; glumes equal or nearly so, equal to or longer than the uppermost floret, pale or purplish, broadly membranous-margined, long-tapered to a sharply acute tip, the first 1-nerved, the second 3-nerved; lemma of the perfect lower floret 6–9 mm long, bearded on the callus with hairs mostly 1–2 mm long, firm and obscurely nerved except near the sharply acute, often cleft, membranous apex, the body scaberulous, at least toward the apex, awned from midlength or above, the awn 10–15 mm long, stout, geniculate, the lower portion twisted; lemma of the upper floret variable in size, usually reduced, awnless or with a straight or geniculate awn more slender than that of the lower floret; anthers 1.5–2.5 mm long. Grass-sedge communities, along lake margins, and on open slopes above timberline, at 3050 to 3720 m in Daggett, Duchesne, Summit, and Uintah counties (Uinta Mts.); southern Rocky Mts. of Colorado to New Mexico; 9(0).

Hierochloe R. Br.

Perennials; culms erect; sheaths open; blades soft, flat to involute; ligule membranous; inflorescence a compact to ultimately open panicle; spikelets compressed, 3-flowered, the 2 lower florets staminate with 3 stamens, the upper floret perfect with 2 stamens, all 3 florets closely occupying nearly the same plane, the rachilla disarticulating above the glumes and the florets falling as a unit; glumes membranous, ovate, equal or the second slightly longer than the first, 1- or 3-nerved, about as long as the uppermost floret; lemmas laterally compressed, usually obscurely 5-nerved, those of the staminate florets entire to short-awned from a bifid tip, the lemma of the perfect floret ultimately hardened, sometimes awned; caryopsis free of but enclosed by the lemma and palea, ellipsoid, the embryo 1/4–1/2 as long as the grain, often undeveloped; $x = 7$.

Weinmarch, G. 1971. Variation and taxonomy of *Hierochloe* (Gramineae) in the Northern Hemisphere. Bot. Not. 124: 129–175.

Hierochloe odorata (L.) Beauv. Sweetgrass. [*Holcus odoratus* L.; *Torresia odorata* (L.) A. S. Hitchc.]. Rhizomatous perennial with an aroma of coumarin; culms solitary or loosely tufted, 1.5–6 (7.5) dm tall, basal sheaths brownish or reddish; blades flat, (2) 3–6 (8) mm wide, scabrous and sometimes long-hairy, those of the culm leaves often much reduced; ligule (0.3) 1.5–6 (8) mm long; panicle mostly pyramidal, compact to open, 3–10 (12) cm long, the branches smooth, ascending to ultimately drooping; spikelets compressed to somewhat inflated, ovate, mostly 3–6.5 mm long and 2–4 mm wide, greenish tan or at maturity bronze, 3-flowered, the florets nearly sessile, the perfect central one flanked by and falling with the larger staminate ones; glumes soon becoming membranous throughout, ovate, 2.5–7.5 mm long, obscurely nerved, slightly shorter to slightly longer than the uppermost floret; lemmas entire or rarely bifid

and awn-tipped, otherwise dimorphic: those of the lateral, staminate florets ovate, 3–5 mm long, more or less keeled, scabrous to appressed short-hairy on the back with longer hairs along the margins; that of the perfect floret lanceolate, 2.2–4 mm long, usually rounded on the back, minutely hairy above midlength, glabrous below; anthers 1.2–2.5 mm long; $2n = 28, 42, 56$. Wet meadows and along streams, lake shores, and margins of spruce-fir and lodgepole pine communities at 2130 to 3500 m in Daggett, Duchesne, Emery, Garfield, Summit, Uintah, Wasatch, and Wayne counties; circumboreal, south throughout most of the western U. S., in the Dakotas, the Great Lake States, and New England; Eurasia; 50 (0). With few exceptions, populations of *H. odorata* are largely infertile, reproducing largely by rhizomes or by apomixis or both (Reeder & Norstog, Bull. Torrey Bot. Club 88: 77. 1961). Weimarck (1971) treats *H. odorata* as a complex comprised of several cytological races.

***Hilaria* H.B.K.**

Perennials; culms stiffly erect or decumbent at the simple to much-branched base; sheaths open; blades flat to involute; ligule membranous or rarely entirely of hairs; inflorescence a more or less slender spike, the superficially uniform spikelets in appressed, often overlapping clusters of 3 at each node of a zigzag rachis, the clusters falling as a unit; the central spikelet 1- or 2-flowered, the lateral spikelets 2- or 3-flowered; glumes membranous to firm, typically laterally compressed, often asymmetrical with the keel near one margin, 2- to 9-nerved, variable within the cluster as to size, shape, and development of awns, shorter to slightly longer than the lemmas; lemma membranous, laterally compressed, 3-nerved, awnless or awned; palea similar to the lemma in texture, varying from slightly shorter to longer than the lemma; stamens (2) 3; caryopsis not seen; $x = 9$.

- 1. Sheaths woolly-hairy to some degree; ligule often chiefly or entirely of hairs. *H. rigida*
- Sheaths essentially glabrous or long-hairy only at the summit, not at all woolly-hairy; ligule a ciliate membrane 1–4 mm long, the hairs mostly shorter than the membranous portion. *H. jamesii*

***Hilaria jamesii* (Torr.) Benth.** Galleta or Curlygrass. [*Pleuraphis jamesii* Torr.]. Strongly rhizomatous or stoloniferous perennial; herbage generally glaucous; culms 1–5 (6.5) dm tall, stiffly erect or sometimes decumbent at the simple to much-branched base, usually puberulent below the inflorescence and long-hairy at the nodes; leaves firm, generally recurved when dry; sheaths glabrous or scaberulous, often with a few long hairs at the summit; blades firm, 1–3 (4) mm wide and mostly 1–16 cm long, flat to involute, long-tapered to a sharply acute tip, glabrous or scaberulous to minutely hairy; ligule membranous, 1–4 mm long, ciliate, the hairs usually shorter than the membranous portion; spike 2–9 cm long, the pale to purple-tinged spikelets in clusters of 3, the clusters 6–11 mm long (including awns) and subtended by a dense tuft of hairs mostly 2–5 mm long; central spikelet about equal to or slightly exceeding the lateral ones, 1- or 2-flowered, the lower floret typically perfect, the upper (when present) usually staminate, the minutely ciliate glumes more or less fan-shaped and irregularly cleft, the (2) 3–9 nerves mostly free at varying levels as

awns 1–6 (7) mm long, occasionally 1 or more awns arising from the back, the body of the glumes shorter than the lemma; lemma lanceolate, 4–9 mm long, apically obtuse to acutish and notched, 3-nerved, the midnerve prolonged as an awn 1–2.5 mm long, the anthers to ca 5 mm long; lateral spikelets 2- or 3-flowered, the florets typically staminate or the upper ones neuter, the glumes narrowly lanceolate to elliptical, shorter to longer than the florets, minutely ciliate with hairs rarely more than 0.5 mm long, tapered to an acute to obtuse tip, the first usually asymmetrical (one side undeveloped), with a straight to ultimately recurved awn 1–6 (7) mm long arising at or above midlength, occasionally lobed or with a second awn, rarely awnless, the second glume often asymmetrical and usually awnless or only minutely awn-tipped, the lemma lanceolate, obtuse to acutish at the tip, more or less obscurely nerved laterally, awnless, the anthers to ca 4 mm long; $2n = 36, 38$. Desert flats to dry foothills, in salt desert shrub, creosote bush, desert shrub, sagebrush, and pinyon-juniper communities chiefly below 2130 m in Beaver, Box Elder, Carbon, Daggett, Duchesne, Emery, Garfield, Grand, Iron, Juab, Kane, Millard, San Juan, Sevier, Tooele, Uintah, Washington, and Wayne counties; southwestern U. S., Wyoming, and Texas; 286(v). Galleta is moderately palatable as forage during the growing season but is harsh and unpalatable after growth ceases. It has the advantage of being drought resistant and tolerant of heavy grazing (Vallentine 1961).

***Hilaria rigida* (Thurber) Benth. ex Scribn.** Big Galleta. [*Pleuraphis rigida* Thurber]. Strongly resembling *H. jamesii*, differing as follows: culms 3–8(10) dm tall, often stout (to 5 mm or more in diameter), woolly-hairy; sheaths (some of them) typically conspicuously woolly-hairy; blades firm to rigid, often woolly-hairy to some degree; ligule ciliate with the membranous portion short or consisting only of a dense ring of woolly hairs; central spikelet typically 1-flowered; lateral spikelets mostly 2-flowered with glumes narrowly oblanceolate to elliptical and obtuse to rounded or truncate at the often erose to shallowly lobed apex, usually ciliate with hairs often 1 mm or more long; $2n = 18, 36, 108$. Creosote bush and shadscale communities below 1220 m in the Mohave desert extension into Washington County; California, Nevada, Arizona, and northern Mexico; 26 (0). Reeder (Amer. J. Bot. 64: 102–110. 1977) presents cytological and morphological evidence of hybridization and subsequent introgression between *H. rigida* and *H. jamesii*.

***Holcus* L.**

Perennials or annuals; sheaths open or closed to above midlength; blades flat; ligule membranous; inflorescence a contracted panicle; spikelets compressed, 2 (3)-flowered, the lower floret perfect, the upper usually smaller and staminate, the rachilla disarticulating above the glumes and often at fruiting between the florets; glumes membranous, subequal, strongly keeled, the first 1-nerved, the second 3-nerved, exceeding the florets; lemmas more or less leathery, shiny, laterally compressed, obscurely nerved, obtuse to abruptly acute apically, lemma of the lower floret awnless, that of the upper floret awned from just below the apex (ours), rarely both awned; palea equal to or slightly shorter than the lemma; stamens 3; caryopsis free of or only slightly adherent to the lemma and palea, the embryo 1/3–2/5 as long as the grain; $x = 7$.

***Holcus lanatus* L.** Yorkshirefog Velvetgrass. [*Notholcus lanatus* (L.) Nash]. Perennial, often short-lived; culms solitary or tufted, mostly (2) 3–10 dm tall, erect or ascending; sheaths open to midlength or below, soft-hairy; blades lax, flat, 3–10 (12) mm wide, soft-hairy throughout; ligule 1–3 (4.2) mm long; panicle compact to loose, 4–15 (20) cm long, whitish to pale green or variously pink- to purple-tinged, the branches erect to ascending-spreading, spikelet-bearing nearly to the base, the rachis and pedicels minutely soft-hairy throughout; spikelets oblong-elliptical, strongly compressed, (3.5) 4–5 (6) mm long, 2 (3) –flowered, the lower floret typically perfect, the upper 1(2) staminate or neuter, usually smaller than the lower one; glumes thin, whitish or purple-tinged, subequal, 3.5–6 mm long, exceeding both florets, scaberulous to puberulent, often awn-tipped, the first glume 1-nerved, the second 3-nerved; lemma more or less leathery, shiny, lanceolate, the lowermost to ca 2.5 mm long and typically awnless, the upper usually smaller with a relatively stout, hooked or occasionally straight, subterminal awn to ca 2 mm long, the awn included within the glumes or exserted; anthers 1.3–2.5 mm long; $2n = 14$. Weed of cultivated places, occasionally in meadows and oak-maple communities, mostly below 1520 m in Cache, Davis, Salt Lake, Utah, and Washington counties; native to Eurasia and Africa, now circumboreal, south in the U. S. throughout most of the West, essentially absent from the Great Plains, well established in much of the East; South America; 10 (i).

***Hordeum* L.**

Annuals or perennials; culms erect, solitary or tufted; sheaths with or without auricles, the membranous sheaths of the lowermost leaves initially closed to the summit or nearly so, those of the culm leaves open; blades flat to involute; ligule membranous; inflorescence a dense terminal spike or spike-like raceme with 3 spikelets at each node of the rachis, the central spikelet perfect and sessile or, in a few species, short-pedicelled, the lateral spikelets short-pedicelled (sessile in the cultivar *H. vulgare*) with rudimentary, staminate or occasionally perfect florets, the rachis at maturity readily disarticulating at the nodes (continuous in *H. vulgare*), the rachis segment falling with the spikelet trio; spikelets 1-flowered, the rachilla of the well-developed florets prolonged behind the palea as a bristle and sometimes bearing a rudimentary second floret; glumes firm, borne in front of the floret and fused at the base, obscurely 1 (3) –nerved, awnlike throughout or in a few species some of the glumes dilated or winged for a short distance above the base; lemma of the central spikelet firm, lanceolate, laterally to somewhat dorsiventrally compressed, obscurely 5-nerved, awned from the apex; palea slightly shorter than the lemma; stamens 3; caryopsis free of or adherent to the palea and sometimes to the lemma, the hilum linear and as long as the grain; $x = 7$. *Hordeum* is a member of the tribe Triticeae (see discussion under *Agropyron*). Species of *Hordeum* are known to hybridize with species in other genera within the Triticeae (Bowden 1967). These hybrids can often be detected, in plants that otherwise have the characters of *Hordeum*, by the presence of more than one floret per spikelet (see guide to hybrids, p. 722).

Rajhathy, T. and J. W. Morrison. 1959. Cytogenetic studies in the genus *Hordeum*. *Canad. J. Genet. Cytol.* 1: 124–132.

1. Rachis remaining intact; spikelets all sessile; lemma with an awn 60–150 mm long and often 1 mm wide near the base (or apically 3-lobed but awnless); plants cultivated, occasionally escaping *H. vulgare*
- Rachis ultimately disarticulating; lateral spikelets short-pedicelled; lemmas with awns variable in length but less than 1 mm wide at the base; plants native or weedy 2
- 2(1). Glumes of at least the central spikelet ciliate along the basally expanded portion, the hairs to ca 1 mm long; lateral spikelets about equal to or longer than the central one *H. murinum*
- Glumes not ciliate below; lateral spikelets typically smaller than the central one 3
- 3(2). Glumes dimorphic, at least the inner glumes of the lateral spikelets slightly to markedly dilated below, the outermost glumes of the spikelet trio awnlike throughout 4
- Glumes uniformly tapered from the base upward, none abruptly expanded near the base 5
- 4(3). Spikes to about 1 cm wide including the awns; awn of the central spikelet typically averaging no more than 8 (2–9) mm long; uppermost sheath typically inflated, spathe-like *H. pusillum*
- Spikes at maturity more than 1 cm wide including the awns; awn of the central spikelet typically averaging more than 8 (8–20) mm long; uppermost sheath not dilated and spathe-like *H. marinum*
- 5(3). Glumes 30–100 mm long, ultimately widely spreading; spike at maturity mostly 4–15 cm wide including the awns *H. jubatum*
- Glumes 6–26 mm long, mostly ascending; spike at maturity to about 3 cm wide including the awns 6
- 6(5). Plants perennial, occupying chiefly native habitats; culms 1–10 dm tall, mostly erect; awn of the central lemma 2–8 (11) mm long *H. brachyantherum*
- Plants annual, weedy; culms to 5 dm tall, frequently geniculate at the lower nodes; awn of the central lemma mostly 8–20 mm long *H. marinum*

***Hordeum brachyantherum* Nevski** Meadow Barley. [*Critesion brachyantherum* (Nevski) Barkworth & D. Dewey; *H. nodosum* of American authors, not L.]. Perennials; culms tufted, erect or occasionally geniculate at some of the lowermost nodes, 1–10 dm tall; sheaths glabrous or variously hairy, lacking auricles; blades flat to loosely involute, 1–8 mm wide, scabrous to long-hairy; ligule 0.2–0.7 mm long; spike 2–10 cm long and at maturity to ca 1.5 cm wide including the awns, erect, green or purplish, the rachis disarticulating, the internodes at mid-length of the spike 1–2 mm long; spikelets 3 per node, the central spikelet sessile, the much reduced

(rarely staminate) lateral ones borne on curved pedicels 0.7–1 mm long; glumes awnlike throughout, mostly 7–15 mm long, scaberulous to the base, straight or nearly so, erect to slightly divergent; lemma of the central spikelets 5–10 mm long, glabrous throughout or scaberulous near the apex, tapering to an awn 2–8 (11) mm long; anthers 0.8–1.8 mm long; $2n = 28$. Mesic to wet sites in the spruce-fir zone mostly between 1830 and 3200 m, infrequently to as low as 3000 m, from all but Daggett, San Juan, Wayne, and Weber counties; Alaska south throughout the western U. S. and in Mexico; sparingly introduced in the eastern U. S. and Canada; Siberia; 142 (x). The largely North American *H. brachyantherum* was thought to be a phase of the European *H. nodosum* [a nomen confusum now replaced by *H. secalinum* Schreber (Tutin et al. 1980)] until Nevski recognized the North American plant as distinct from *H. secalinum* in having no auricles, shorter awns, and smaller anthers. *Hordeum brachyantherum* occasionally forms natural hybrids with *H. jubatum* (q.v.) and with *Elymus trachycaulus*. See discussion following *H. jubatum* on the relationship between *H. brachyantherum* and *H. jubatum*. Meadow barley is palatable but rarely present in sufficient quantity to constitute a good source of forage.

Hordeum jubatum L. Foxtail Barley. [*Critesion jubatum* (L.) Nevski]. Perennials, short-lived, sometimes flowering the first year; herbage glabrous to densely soft-pubescent throughout; culms tufted, 0.7–5 (7) dm tall, erect, or sometimes decumbent at the base, occasionally geniculate at some of the nodes; sheaths with auricles lacking or less than 0.5 mm long; blades flat to involute, 1–5 mm wide; ligule 0.2–1 mm long; spikes ultimately nodding, 4–15 cm long and at maturity often nearly as wide (including the awns), pale green or purple, the rachis readily disarticulating; spikelets 3 per node, the central spikelet sessile, the much reduced lateral ones borne on curved pedicels to about 1 mm long; glumes awnlike throughout, mostly 3–8 (10) cm long, ultimately widely spreading; lemma of the central spikelet 5.5–8 mm long, tapered to an ultimately widely spreading awn mostly 2–8 cm long; anthers 1–1.5 mm long; $2n = 14, 28, 42$. Along roadsides, in saline meadows, and sporadically in every type of plant community from salt desert shrub at 1280 m to aspen-conifer communities as high as 3350 m, also occupying dry weedy areas and open rocky slopes, known from all but Morgan and Piute counties; throughout most of temperate North America; Siberia; adventive in many other parts of the world; 186 (v). On the bases of interfertility and chromosome homology, Rajhathy and Morrison (1959) conclude that *H. jubatum* and *H. brachyantherum* are conspecific; but Mitchell and Wilton (1964) cite differences in morphology, habitat preference, and overall geographic distribution favoring the continued recognition of two species. In our area, these taxa form distinct, largely isolated populations, with only an occasional plant appearing to be a hybrid (e.g., Brotherston 2774 and Neese 14921, BRY). Plants with awns of the lemmas intermediate in length between those of *H. jubatum* and *H. brachyantherum* (1.5–3 cm long) have been referred to *H. caespitosum* Scribn. or to *H. jubatum* var. *caespitosum* (Scribn.) A. S. Hitchc. According to Mitchell and Wilton (1964), such plants are the result of hybridization between the two species and should be referred to *H. x caespitosum* Scribn. *Hordeum jubatum* also hybridizes

occasionally with *Elymus trachycaulus* (see guide to hybrids, p. 722). Foxtail barley is a native plant that moves into disturbed areas in the manner of an introduced weed. Although it is rated fair as forage for cattle prior to seed-head development, mature fruiting heads can cause injury to eyes and mouth parts of all grazing animals. The species is widely cultivated in Europe and the U.S.S.R. as an ornamental.

Hordeum marinum Hudson Mediterranean Barley. [*Critesion marinum* (Hudson) Love; *H. geniculatum* All., nom. ambig.; *H. gussoneanum* Parl.; *H. hystrix* Roth]. Annual; culms solitary or tufted, mostly 1–5 dm tall, erect or frequently geniculate at some of the lower nodes; herbage gray green; sheaths glabrous or short-hairy, the auricles obscure or lacking; blades flat to loosely involute, 1–3.5 mm wide, glabrous or scaberulous to short-hairy; ligule 0.2–0.5 mm long; spikes erect, mostly 2–5 cm long and to ca 3 cm wide including the stiffly ascending to moderately spreading awns, the rachis readily disarticulating, the internodes 0.8–1.5 mm long; spikelets 3 per node, the central spikelet sessile, the moderately to greatly reduced lateral ones borne on straight to slightly curved pedicels 0.7–1.5 mm long; glumes mostly (6) 9–22 (26) mm long, typically smooth or nearly so at the base, scaberulous above, all awnlike or the inner glumes of the lateral spikelets dilated below, the expanded portion 0.2–0.6 (1.4) mm wide; lemma of the central spikelet 5–6.5 mm long, glabrous or rarely scaberulous, with an awn 8–20 mm long; anthers 0.5–1 mm long; $2n = 14, 28$. Salt desert shrub, along roadsides, and as a weed of other dry waste places chiefly below 1370 m but occasionally to 1650 m, in Box Elder, Cache, Davis, Salt Lake, Utah, and Weber counties; native of Eurasia, adventive in British Columbia and Ontario, south in the U. S. through much of the West and in Mexico; South America; 32 (vii). As described by Tsvelev (1984), the inner glume of the lateral spikelets of *H. marinum* varies from awnlike throughout to markedly dilated below. Some authors (e.g., Tutin et al. 1980) treat those plants with the inner glume not at all or only slightly dilated as *H. hystrix* Roth, and those with the inner glume "lanceolate or winged below" as *H. marinum*. European specimens seen at the National Herbarium exhibit a continuum of variation, however, the lateral spikelets with inner glumes ranging from 0.2–1.4 mm wide, occasionally the entire range of variation occurring within a single population. For this reason, and because no other character is consistently correlated with the width of the inner glume, I have followed the treatment of Tsvelev (1984), according to which our plants, with the inner glumes of the lateral spikelets only moderately dilated, are ssp. *gussoneanum* (Parl.) Thell.

Hordeum murinum L. Rabbit Barley. [*Critesion murinum* (L.) Love; *H. glaucum* Steudel; *H. leporinum* Link; *H. stebbinsi* Covas]. Annual; culms solitary or loosely to densely tufted, 0.5–8 (10) dm tall, frequently geniculate at some of the nodes; sheaths usually glabrous, often with slender auricles; blades flat or folded, 2–10 mm wide, glabrous or short-hairy; ligule to ca 1 mm long; spikes erect, 2–12 cm long and to ca 3 cm wide at midlength including the awns, the rachis readily disarticulating, the internodes 1.5–3 mm long; spikelets 3 per node, about equal in length or the lateral ones longer than the central one, the central spikelet sessile or borne on a pedicel to ca 2 mm long, the sterile or staminate lateral ones borne on

erect pedicels 1–2 mm long; glumes of the central spikelet mostly 12–30 mm long, expanded for a short distance above the base to ca 0.5 mm wide at the widest point, the expanded portion ciliate with hairs to ca 1 mm long; glumes of the lateral spikelets dimorphic, the outer awnlike or nearly so throughout the length, subglabrous to scaberulous, the inner slightly to distinctly dilated below, the expanded portion often ciliate; lemma of the central spikelet 6–12 mm long, glabrous or scaberulous, tapered to an awn 1–5 (6) cm long; lemmas of the lateral spikelets 7–18 mm long, each tapered to an awn about equal to that of the central one; anthers 0.2–1.4 mm long; $2n = 14, 28, 42$. Chiefly a weed of roadsides, cultivated areas, and dry waste places, rare on saline soils and in sagebrush and mountain brush-conifer communities, mostly at 810 to 1830 m, occasionally as high as 3000 m, in Cache, Davis, Grand, Kane, Millard, Salt Lake, San Juan, Sevier, Tooele, Utah, Washington, and Weber counties; native to Europe, adventive in British Columbia, now established throughout the western U. S., in Texas, and northern Mexico; South America and Asia; 91 (ix). *Hordeum murinum* sensu lato has been treated as consisting of two or more species based chiefly upon a single character or quantitative differences, the range of variation in each character either overlapping or forming a continuum. Consistent correlation between even two of six features used by various authors as distinguishing characteristics was lacking in 19 of 35 specimens examined. I have, therefore, followed Tsvelev (1984) and Tutin et al. (1980) in treating the complex as a single species.

Hordeum pusillum Nutt. Little Barley. [*Critesion pusillum* (Nutt.) Love; *H. pusillum* var. *pubens* A. S. Hitchc., type from LaVerkin, Washington County]. Annual; culms solitary or loosely tufted, 1–4 (6) dm tall, erect to ascending or geniculate at some of the nodes; sheaths glabrous to long-hairy, without auricles, the uppermost inflated; blades flat, 1–5 mm wide, glabrous or scabrous to long-hairy; ligule 0.2–0.8 mm long; spikes erect, 2–8 (9) cm long and to ca 1 cm wide including the awns, the rachis readily disarticulating, the internodes to ca 2 mm long; spikelets 3 per node, the central spikelet sessile, the usually reduced lateral ones borne on curved pedicels 0.3–2.3 mm long; glumes mostly 7–17 mm long, usually scaberulous, the inner glumes of the lateral spikelets and often those of the central spikelet dilated below, the expanded portion 0.5–1.8 mm wide, the outermost glumes of the spikelet trio awnlike throughout; lemma of the central spikelet 4–7 (8) mm long, glabrous to pubescent, with an awn 2–9 mm long; anthers 0.5–1.3 mm long; $2n = 14$. Roadsides, in salt desert shrub, desert shrub, and pinyon-juniper communities, at 1280 to 1980 m in Garfield, Grand, Salt Lake, San Juan, Uintah, and Washington counties; British Columbia, Alberta, and Ontario, south throughout most of the U. S., and in Mexico; South America; 20(i).

Hordeum vulgare L. Common Barley. Annual; culms moderately stout, erect, 5–14 dm tall; sheaths glabrous, typically with auricles to 6 mm long; blades flat, 5–16 mm wide, glabrous or scabrous; ligule 0.5–3 mm long; spikes erect to nodding, 2–10 cm long excluding awns the rachis continuous; spikelets 3 per node, all sessile and fertile; glumes subulate, to about 8 mm long, nerveless or 1– to 3-nerved, glabrous or scaberulous to appressed-hairy, tapering to a slender, smooth to scabrous awn mostly 4–20 mm long; lemma (6.5) 8–12 mm long, glabrous and

often glaucous, tapering to a flattened, smooth to scabrous awn to 15 cm long and to ca 1 mm wide near the base (in some cultivars the lemma 3-lobed but awnless at the apex); anthers 2–2.5 mm long; $2n = 14, 28$. Barley is native to Eurasia and widely cultivated as a cereal throughout the temperate and subtropical regions of the world. It occasionally escapes from cultivation but is not known to persist; 5 (ii).

Imperata Cirillo

Rhizomatous perennials; culms tufted, mostly tall; sheaths open; blades flat; ligule membranous; inflorescence a terminal, contracted, whitish panicle, the spikelets borne on closely spaced, short pedicels arising in groups of 2 or 3 from erect-ascending branches; spikelets terete or subterete, 2-flowered, disarticulating below the glumes, the lower floret neuter, the upper perfect, the upper floret much shorter than the long white hairs arising from the base of the spikelet and from the glumes; glumes membranous, subequal, about equal to the upper floret, 3- to 9-nerved; sterile lemma and the fertile lemma and palea hyaline; stamens 1 or 2; caryopsis free of but usually remaining enclosed within the lemma and palea, the embryo about 1/2–3/5 as long as the grain; $x = 10$.

Imperata brevifolia Vasey Satintail. [*I. hookeri* Rupr. ex Hackel]. Perennial with short, scaly rhizomes; culms tufted, erect, 0.7–1.5 m tall; sheaths glabrous; blades flat, (3) 4–18 mm wide and to ca 5 dm long, tapered at both ends, glabrous throughout or more often long-hairy near the base of the blade; ligule 1–2 mm long, usually truncate; panicle contracted, dense, 1–3 dm long and to ca 3 cm wide, silvery white to grayish, speckled with the brown of anthers and stigmas, the slender branches more or less elongate, erect-ascending and spikelet-bearing to the base or nearly so; spikelets 2-flowered, subterete, awnless, largely obscured by silky white hairs mostly 8–15 mm long arising from the spikelet base and from the glumes; glumes membranous, narrowly lanceolate, 5- to 7-nerved, long-hairy, the first 2.3–3.5 mm long, the second to 4 mm long, about equal to the upper floret; first floret consisting of a neuter lemma to ca 2.5 mm long, the upper floret perfect with a lanceolate lemma to ca 3.5 mm long, the palea broadly ovate; anthers 1.4–2.5 mm long; caryopsis obovoid, ca 1 mm long, dark brown. Streamside and in other moist places below 1220 m in San Juan County; California east to New Mexico, Texas, and Mexico; 4 (0).

Koeleria Pers.

Annuals or tufted perennials; sheaths open; blades narrow, flat to involute; ligule membranous; inflorescence a more or less glistening, spikelike panicle; spikelets laterally compressed, lanceolate to elliptical, 2- to 5-flowered, the rachilla disarticulating above the glumes and between the florets, prolonged beyond the uppermost floret as a short, usually scabrous bristle or bearing a rudimentary floret; glumes equal or unequal, keeled, the first 1-nerved, the second 3- to 5-nerved, slightly shorter than the lowermost floret to barely exceeding the uppermost one; lemma lanceolate to ovate-lanceolate, keeled, 3- to 5-nerved, acute or occasionally short-awned; palea hyaline throughout, equal to or shorter than the lemma; stamens 3; caryopsis free within the lemma and palea, the embryo not more than 1/3 the length of the grain; $x = 7$.

Greuter, W. 1968. *Notulae nomenclaturales et bibliographicae* 1-4. *Candollea* 23: 81-108.

Shinners, L. H. 1956. Illegitimacy of Persoon's species of *Koeleria* (Gramineae). *Rhodora* 58: 93-96.

Koeleria macrantha (Ledeb.) Schultes Junegrass. [*K. cristata* (L.) Pers.; *K. gracilis* Pers.; *K. nitida* Nutt.; *K. pyramidata* of American authors, not (Lam.) Beauv.]. Loosely tufted perennial, sometimes with short rhizomes; culms 1-7 (8) dm tall; leaves chiefly basal; sheaths glabrous or scabrous to more often retrorsely puberulent; blades flat to involute, 0.5-2 (3) mm wide, more or less prow-shaped at the long-tapered tips, smooth or minutely to strongly scabrous, occasionally short-hairy; ligule 0.2-2 mm long, truncate; panicle spikelets, (2)3-16 cm long and 0.5-1.5 (2) cm wide when pressed, occasionally somewhat interrupted or the branches spreading at flowering, the lower branches rarely more than 2 cm long, densely flowered with the spikelets mostly pale and glistening (especially at flowering when the hyaline paleas are exposed), the rachis, pedicels, and branches minutely soft-hairy (at 10x magnification); spikelets compressed, 3-6 (6.3) mm long, 2 (3-4) -flowered, the rachilla minutely hairy (at 10x magnification), sometimes prolonged beyond the uppermost floret when 2-flowered; glumes narrowly lanceolate to oblanceolate-elliptical, subequal or unequal, strongly keeled, broadly membranous and glistening on the margins, abruptly to sharply acute and occasionally minutely awn-tipped at the apex, subglabrous to scaberulous, the first (2) 2.5-5 (6) mm long, narrower than the second, 1-nerved, the second 3-6 (6.3) mm long, obscurely to distinctly 3- to 5-nerved, slightly shorter than the lower floret to barely exceeding the upper one; lemmas similar to the glumes in texture and color, lanceolate, often narrowly so, (3) 3.5-6 (6.3) mm long, strongly laterally compressed, obscurely 5-nerved, minutely hairy on the callus, otherwise glabrous to scaberulous, acute to awn-tipped or with a subterminal awn to ca 1 mm long; palea shiny-hyaline throughout, usually slightly shorter than the lemma, spreading at flowering; anthers 1.2-2.5 (3) mm long; $2n = 14-16, 28, 42, 70$. Chiefly in sagebrush, mountain brush, and pinyon-juniper communities, and on open slopes, or occasionally in moist meadow communities, at 1370 to 3480 m in Beaver, Box Elder, Cache, Carbon, Daggett, Davis, Duchesne, Emery, Garfield, Grand, Kane, Morgan, Piute, Rich, Salt Lake, San Juan, Sanpete, Sevier, Summit, Uintah, Utah, Wasatch, Washington, and Wayne counties; circumboreal, south throughout the western half of the U. S., in much of the East, and into Mexico; Eurasia; 209 (xvi). The tortuous nomenclatural history of this plant is briefly described by Arnov et al. (1980). Although Shinners (1956) arrived at the name *K. macrantha* as the correct one for our plants, Gould (1975), without explanation, refers North American plants to *K. pyramidata*. European taxonomists assign a more robust phase of the complex (plants having spikelets (5) 6-8 mm long) to *K. pyramidata* and smaller plants (having spikelets 2-5 (6) mm long) to *K. macrantha*. Although North American populations of *K. macrantha* occasionally contain some plants with a few spikelets more than 6 mm long, none match in all details the specimens of *K. pyramidata* seen at the Komarov Botanical Institute. Until the complex as it occurs throughout its range is better understood, however, the name *K. macrantha* should be considered tentative. Two collections of *K. macrantha*

(Harrison 12518 UT and Harrison 12527 BRY) provide evidence of hybridization between this species and *Trisetum spicatum*. One sheet contains two plants, one of which is "good" *K. macrantha*, whereas the other has with the awned lemmas, long-hairy rachilla, and broad leaves of *T. spicatum* in combination with the exposed paleas and longer anthers of *K. macrantha*. The second sheet is similar to the first except that the anthers are short as in *T. spicatum*. *Koeleria macrantha* can be distinguished from two outwardly similar species with which it is occasionally sympatric (*Poa fendleriana* and *Trisetum wolfii*), by the minutely hairy panicle axis and generally smaller spikelets.

Leersia Sol. ex Swartz

Perennials, mostly rhizomatous; herbage glabrous to strongly scabrous; sheaths open; blades mostly long-tapered to a sharply acute tip; ligule membranous; inflorescence an open panicle with the spikelets subsessile or short-pedicelled, in strongly overlapping, and mostly single rows along branches and branchlets; spikelets mostly flat, 1-flowered, disarticulating below the spikelet and, in most species, falling entire; glumes lacking or reduced; lemma membranous or firm, laterally compressed and sharply keeled, 5-nerved, the marginal nerves sometimes indistinct; palea narrow, usually 3-nerved, the lateral nerves marginal; stamens 1-6; caryopsis free within the lemma and palea, the embryo typically ca 2/5 the length of the grain; $x = 12$.

Leersia oryzoides (L.) Swartz Rice Cutgrass. [*Phalaris oryzoides* L.; *Homalocenchrus oryzoides* (L.) Mieg]. Rhizomatous perennial; culms 0.5-1.5 (2) m tall, solitary or loosely tufted, tapered to a usually weak base and supported by surrounding vegetation, simple or branched at nodes above the base; sheaths usually strongly scabrous, the collar often puberulent; blades (3) 6-15 mm wide and to ca 3 dm long, flat or folded, long-tapered to a sharply acute tip, usually scabrous, strongly so on the margins; ligules firm, to ca 1 mm long, truncate; panicles 1-2 (3) dm long, ultimately open and nodding or more or less erect in age, the spikelets overlapping in a single row and appressed to one side of the slender, often flexuous branches; panicles of culm branches remaining at least partially included within the sheath, the included florets cleistogamous; spikelets flat, asymmetrically elliptical, 1.5-2 mm wide; glumes lacking; lemma semicircular, 3.7-5.5 mm long, ciliate on the sharp keel with minute stiff hairs, more or less scabrous on the 5 nerves and on the area between; palea equal to or slightly longer and much narrower than the lemma, stiffly ciliate on the sharp keel; stamens 3, the anthers to ca 2 mm long; $2n = 48, 60$. Wet, heavily vegetated sites along waterways or in marshes below 1400 m in Davis, Utah, and Weber counties; Canada, throughout the U. S. and in Mexico; Eurasia; 19 (ii).

Leptochloa Beauv.

Tufted annuals and perennials; sheaths open; blades flat to involute; ligule membranous; inflorescence a panicle with few to numerous spikelets or racemose branches, these 1-4 or more per node, the spikelets sessile or short-pedicelled and remote to closely overlapping; spikelets 2- to 12-flowered, subterete to distinctly compressed, disarticulating above the glumes and between the florets, the uppermost florets in some species stami-

nate or neuter; glumes membranous, laterally compressed and more or less keeled to rounded on the back, the first 1-nerved, the second 1- to 3-nerved, shorter to longer than the lowermost lemma; lemma similar to the glumes in texture and color, laterally compressed and more or less keeled to dorsiventrally compressed, 3-nerved, acute to truncate and entire or erose to bifid at the apex, awnless or mucronate to awned; palea well developed; stamens 3; caryopsis free within the lemma and palea, the embryo to about half the length of the grain; $x = 10$. The characters upon which McNeill (1979) based the separation of *Leptochloa* into *Diplachne* and *Leptochloa* are not consistently correlated throughout the complex. Gould and Shaw (1983), without explanation, follow Hitchcock (1951) in treating *Leptochloa* as a single genus.

McNeill, J. 1979. *Diplachne* and *Leptochloa* (Poaceae) in North America. *Brittonia* 31: 399-404.

1. Spikelets 1.5-3.5 mm long; sheaths usually papillose-hairy *L. filiformis*
- Spikelets 4-13 mm long, sheaths glabrous or scabrous ... 2
- 2(1). Lemmas averaging more than 3 (3-6) mm long, mostly sharply acute, the midnerve often prolonged as an awn 0.5-3.5 mm long, second glumes sharply acute *L. fascicularis*
- Lemmas averaging no more than 3 (1.8-3) mm long, abruptly acute to truncate and usually mucronate; second glume abruptly acute to rounded *L. uninervia*

Leptochloa fascicularis (Lam.) Gray Bearded Sprangletop. [*Festuca fascicularis* Lam.; *Diplachne fascicularis* Beauv.]. Tufted annual; culms 1-7 (10) dm tall, erect to ascending or rarely prostrate, often branched at nodes above the base; sheaths glabrous; blades flat to loosely involute, 1-5 (7) mm wide, long-tapered to sharply acute or filiform tips, smooth or scabrous to occasionally sparsely hairy, those of the culm often equal to or exceeding the inflorescence; ligule 2-7 mm long; panicle 7-30 (40) cm long, typically partially enclosed by the uppermost sheath, the few to numerous, stiffly erect to widely spreading, spikelike branches mostly 4-12 cm long; spikelets mostly on pedicels less than 1 mm long, appressed, overlapping to remotely spaced, 5- to 12-flowered, linear, subterete, 4-13 mm long, initially whitish or pale green, becoming grayish at maturity, rarely purple-tinged; glumes unequal, 1-nerved, mostly sharply acute and sometimes minutely awn-tipped, the first subulate to narrowly lanceolate, 1.3-4 mm long, the second lanceolate to elliptical, 2.5-4 (5) mm long, shorter than the lowermost lemma; lemma similar to the glumes in texture and color, rounded on the back, mostly lanceolate to elliptical, 3-5 (6) mm long, 3-nerved, appressed-hairy, at least near the base of the lateral nerves, the entire or minutely bifid apex acute, the midnerve usually prolonged as a mucro or as an awn to ca 3.5 mm long, the lateral nerves often prolonged as minute teeth; anthers 0.2-0.5 mm long; $2n = 20$. Wet or drying margins of waterways, ponds, and lakes, occasionally partially submerged in shallow water, at 1310 to 2740 m in Cache, Grand, Duchesne, Salt Lake, San Juan, Uintah, Utah, and Washington counties; throughout most of the U. S.; Mexico; South America; 26 (iii).

Leptochloa filiformis (Lam.) Beauv. Red Sprangletop. [*Festuca filiformis* Lam.]. Annual; culms solitary or tufted, 0.8-8 (10) dm tall, erect to decumbent-based and

spreading, usually sparingly branched at nodes above the base; sheaths typically pubescent with papilla-based, soft hairs to 6 mm long; blades flat or folded, mostly 2-13 mm wide, long-tapered to sharply acute or filiform tips, smooth or scaberulous, sometimes papillose-hairy near the base; ligule 0.5-2 mm long, ciliate and sometimes appearing to be of hairs; panicle 10-40 cm long, usually 1/3-1/2 the height of the plant, with few to numerous, ascending to spreading, spikelike branches 2-15 cm long; spikelets sessile or occasionally short-pedicelled, appressed to the rachis, slightly overlapping to more or less remote, 2- to 4-flowered, lance-elliptical, 1.5-3.5 mm long, green or more often reddish purple; glumes equal or subequal, 1-nerved, acute to long-tapered at the apex, the first subulate, 1-2.5 mm long, the second slightly broader, 1.5-2.7 mm long, shorter to longer than the first glume, slightly shorter to distinctly longer than the lowermost lemma, sometimes both glumes exceeding all the florets; lemma similar to the glumes in texture and usually in color, mostly compressed laterally and slightly keeled along the midnerve, 0.7-1.7 mm long, 3-nerved, abruptly acute to truncate and often erose to minutely bifid at the apex, usually appressed-hairy along each nerve, at least below; anthers to ca 0.3 mm long; $2n = 20$. Known in Utah by a single collection (Higgins 823 BRY) from a wet site near a spring below 1520 m in a creosote bush community in Washington County; southwestern U. S. east through Texas to Mississippi; rare in the eastern U. S.; Mexico; South America; 1 (0).

Leptochloa uninervia (Presl) Hitchc. & Chase Mexican Sprangletop. [*Megastachya uninervia* Presl]. Tufted annual; culms mostly 4-10 dm tall, usually strictly erect, often branched at nodes above the base; sheaths glabrous or scabrous; blades flat to loosely involute, 1-4 mm wide, elongate, long-tapered to filiform tips, smooth or more often scabrous; ligule 2-6 mm long; panicle narrowly ovoid to oblong, 10-30 cm long, tardily emergent from the uppermost sheath, the usually numerous, stiffly erect to moderately spreading, spikelike branches mostly 2-7 cm long; spikelets on pedicels mostly less than 1 mm long, typically appressed to the rachis and overlapping, 6- to 10-flowered, subterete to oblong, 4-10 mm long, pale gray green to dark gray; glumes unequal, 1-nerved, the first subulate to linear, 0.8-1.7 mm long, acute to obtuse, the second oblong to oblanceolate, 1.5-2.6 mm long, abruptly acute to rounded and often minutely mucronate, shorter than the lowermost lemma; lemma similar to the glumes in texture, usually darker in color, rounded to somewhat flattened on the back, 1.8-3 mm long, 3-nerved, abruptly acute to truncate and usually mucronate, the lateral nerves rimming the margins and often inconspicuous, sparsely hairy near the base of each nerve, the lateral nerves sometimes protruding as minute teeth; anthers 0.2-0.6 mm long; $2n = 20$. Known in Utah by a single collection (Menzies 8001 BRY) from a moist site in a grass community at 1370 m in Utah County; California east to Colorado and from Arizona to Mississippi, sparingly introduced along the eastern seaboard; Mexico; South America; 1 (0).

Leucopoa Griseb.

Imperfectly dioecious perennials; sheaths open; ligule membranous; inflorescence a loose to contracted panicle; spikelets subterete to flattened, 3- to 7-flowered, the rachilla disarticulating above the glumes and between the

florets; glumes soon membranous throughout, pale, obscurely nerved; lemmas pale green, soon membranous, laterally compressed and somewhat keeled to rounded on the back, 5-nerved; stamens 3; caryopsis at maturity typically adherent to lemma and palea, bidentate apically, the embryo less than half as long as the grain; $x = 7$. This North American species was included in *Festuca* by Hitchcock (1935) and removed by Chase to *Hesperochloa* (Hitchcock 1951). Weber (1966) found the genus *Hesperochloa* inseparable from the largely Asian genus *Leucopoa*, but meantime Tsvetlev (1984) has returned *Leucopoa* to subgeneric rank under *Festuca*.

Weber, W. A. 1966. Additions to the flora of Colorado IV. Univ. Colorado Stud. Ser. Biol. 23: 2.

Leucopoa kingii (Wats.) W. A. Weber Spike Fescue. [*Poa kingii* Wats.; *Festuca confinis* Vasey; *Festuca kingii* (Wats.) Cassidy; *Hesperochloa kingii* (Wats.) Rydb.]. Incompletely dioecious perennial, often with short rhizomes; herbage green or glaucous; culms usually densely tufted, (2) 3–10 dm tall; sheaths smooth, the old sheath bases straw colored and persistent; blades firm, erect-ascending or occasionally recurved, flat or loosely involute upon drying, mostly 2–10 mm wide, long-tapered to an acute tip, smooth or occasionally scaberulous; ligules 0.5–4 mm long; panicle narrow, (5) 10–20 cm long, the branches erect or slightly spreading, smooth or occasionally sparingly scabrous on the angles; spikelets soon turning tawny, subterete to somewhat compressed, 6–10 (12) mm long, 3- to 5 (6)-flowered, the florets mostly functionally unisexual; glumes initially green along the midnerve, becoming membranous throughout, broadly lanceolate to ovate, rounded on the back to more or less keeled, glabrous, the first glume (2) 3–5.5 mm long, 1-nerved, the second 4–7 mm long, shorter than the lowermost lemma, 3-nerved, the lateral nerves obscure; lemma firmer than the glumes, lanceolate to ovate, (4.5) 5–9 (10) mm long, rounded on the back to more or less keeled, obscurely to distinctly 5-nerved, typically roughened to scabrous throughout (at 10x magnification), acute to minutely awn-tipped at the apex; palea about as long as the lemma; pistillate florets with anthers to ca 1 mm long, the staminate ones with anthers 2.5–6 mm long; $2n = 56$. Chiefly grassy or lightly wooded slopes in oak-sagebrush and aspen-spruce-fir zones and on exposed rocky slopes at high elevations, occasionally in pinyon-juniper, ponderosa pine, and meadow communities, at 1370 to 3660 m in Box Elder, Cache, Carbon, Daggett, Davis, Duchesne, Emery, Juab, Morgan, Piute, Rich, Salt Lake, Sanpete, Tooele, Utah, Wasatch, and Weber counties; in most of the western U. S., in the Great Plains as far south as Kansas; 161 (vi). In our area, staminate plants appear to outnumber pistillate ones, but the range of variation in size of spikelets and lemmas in the plants I have seen is the same for pistillate as in staminate florets. *Poa fendleriana* differs from *L. kingii*, which it superficially resembles, in having sheaths closed at least near the base, mostly involute leaves rarely more than 3 mm wide, and lemmas no firmer than the glumes and often pubescent on the keel and marginal nerves, rarely scabrous throughout. Spike fescue is palatable as forage in the spring but becomes harsh and unpalatable as it matures. Because it occurs chiefly as scattered clumps, its production per acre is usually low (Valentine 1961).

Lolium L.

Annuals or perennials; sheaths open, with or without auricles; blades flat to more or less involute; ligule membranous; inflorescence a solitary terminal spike (rarely branched), the spikelets solitary and sessile at each node of the rachis, narrowly oblong to elliptical, compressed, 2- to 22-flowered, the rachilla disarticulating above the glumes and between the florets; first glume lacking except on the terminal spikelet, the second glume 3- to 9-nerved, awnless, shorter to longer than the lowermost florets; lemma membranous to hardened, mostly lanceolate, laterally compressed, rounded on the back, 5- to 9-nerved, awnless or awned; palea usually subequal to but as broad as the lemma; stamens 3; caryopsis somewhat adherent to the lemma and palea, with an apical appendage, the embryo 1/6–1/3 as long as the grain; $x = 7$. When taxonomic considerations are based on characteristic of the flower and fruit rather than those of the inflorescence, *Lolium perenne*, traditionally included in the tribe Triticeae, is seen to be more closely related to *Festuca pratensis* (q. v.) than to other species of *Lolium*, and *F. pratensis* is likewise more closely allied to *L. perenne* than to other representative species of *Festuca* (Stebbins, Evolution 10: 235–236. 1956). The ease with which the two species hybridize supports this contention. Accordingly, Gould and Shaw (1983) include the genus *Lolium* in the tribe Poaceae.

Lolium perenne L. Ryegrass. [*L. multiflorum* Lam.; *L. perenne* var. *italicum* Parnell]. Annual or perennial; culms tufted, mostly erect, 3–7 (10) dm tall; sheaths with auricles often well developed; blades flat or somewhat involute, 2–8 (10) mm wide; ligule to 1.5 mm long; spike 7–25 cm long; spikelets (3) 4- to 15 (20)-flowered, 7–20 (23) mm long, solitary and sessile at each node, placed edgewise to and alternating on opposite sides of the rachis; first glume (adaxial) lacking except on the terminal spikelet, the second glume membranous or hardened, lanceolate, (4) 6–12 mm long, mostly 5- to 9-nerved, 1/2–3/4 as long as the spikelet; lemma membranous or hardened, (4) 5–7.5 (8) mm long, rounded on the back with margins inrolled at maturity, mostly 5-nerved, the lateral nerves typically conspicuous, the remainder more or less obscure, glabrous or scaberulous, acute or with awns to 8 mm long; anthers (2) 3–4 mm long; $2n = 14$. An escape from cultivation, in dry to moist sites, along waterways, in waste places, fallow fields, and on open grassy slopes at 760 to 2440 m in Cache, Davis, Duchesne, Garfield, Grand, Salt Lake, Sanpete, Tooele, Utah, Wasatch, Washington, and Weber counties; native to Eurasia and Africa, now circumboreal, south throughout most of the U. S. and in Mexico; South America; 58 (v). *Lolium multiflorum* is often treated as a species distinct from *L. perenne* in being annual and in having larger spikelets, more numerous florets, and awned rather than awnless lemmas. As it occurs in this hemisphere, the grass is a mixture of annual and perennial forms from which improved varieties have been developed for commercial use. In the absence of consistent correlation between even two characters, recognition of more than one species becomes impractical. Although the awned form may be referred to var. *aristatum* Willd. [var. *italicum*], individual panicles may bear both awned and awnless lemmas, rendering unsatisfactory the recognition of variation even at the infraspecific level (Gould 1975). Ryegrass is thought to be the first meadow grass to have been

cultivated in Europe, records of its use in England dating back to 1681. It was being grown in North America as early as 1782 (Gould and Shaw 1983) and is now widely used for pasture, hay, lawns, and erosion control in most of North America and in temperate South America. See *Festuca pratensis* for discussion of hybrids between that species and *L. perenne*.

***Lycurus* H.B.K.**

Perennials; culms tufted, erect; sheaths open; blades narrow, flat or folded; ligule membranous; inflorescence a cylindrical, spikelike panicle with spikelets borne on mostly paired pedicels, these united at the base and disarticulating as a unit; spikelets narrowly lanceolate, subterete, 1-flowered, not or only tardily disarticulating, the floret borne on the shorter pedicel staminate or neuter, that borne on the longer pedicel perfect; glumes subequal, the first 2 (3)-nerved, the second 1-nerved, both with the nerves prolonged as slender awns, the body of the glumes shorter than the lemma; lemma 3-nerved, the midnerve prolonged as an awn; palea about equal to or shorter than the lemma; stamens 3; caryopsis free of the lemma and palea; $x = 10$. According to Reeder (1985), who treats the North American genus *Lycurus* as consisting of three species, plants north of the Trans-Pecos region of Texas [*L. setosus* (Nutt.) C. Reeder] are distinct from the remainder of the complex in having at least the upper leaves terminating in a slender seta to 10 mm long or more, ligules (3) 5–10 mm long, and culms erect. In contrast, the plants south of the Trans-Pecos are described as having leaves without setae or with only short mucros, ligules 0.5–2 (3) mm long, and culms decumbent or ascending to widely spreading. Those plants I have seen (all from north of the Trans-Pecos) do indeed have the mostly longer ligules and seta-tipped leaves described by Reeder, although some of them have decumbent-based, spreading culms. I suggest that variation of this nature, in which some overlapping occurs, might more reasonably be given recognition at the infraspecific rather than at the specific level.

Reeder, C. G. 1985. The genus *Lycurus* (Gramineae) in North America. *Phytologia* 57: 283–291.

***Lycurus phleoides* H.B.K.** Wolf tail. Perennial; culms tufted, 1.5–6 dm tall, simple or sparingly branched at the nodes, erect or decumbent near the base, often geniculate at nodes below midlength, the culms then ascending to widely spreading; sheaths generally keeled, glabrous or puberulent; blades flat or folded, 1–2 (3) mm wide and mostly 3–15 cm long, usually scabrous on the narrow white margins, terminating in a sharply acute to bristle-like tip; ligule (1.8) 2–6 (10) mm long, acute or 3-lobed; panicle spikelike, cylindrical, (2) 3–10 (13) cm long and 3–8 mm wide, densely flowered, the short branches erect or nearly so, rebranched immediately above the base to form two subequal pedicels averaging less than 2 mm long, each branch disarticulating at the base of the paired pedicels, the spikelets and attached pedicels usually falling as a unit; spikelets subterete, 1-flowered, borne on short, mostly paired, erect pedicels, the florets perfect, staminate or neuter, that on the shorter pedicel more frequently reduced than that on the longer one; glumes membranous, narrow, subequal, 1–1.8 mm long,

the first 2-nerved and 2-awned, the second 1-nerved with a solitary awn, the awns mostly 1–5 mm long, the body of the glumes shorter than the lemma; lemma similar to or slightly firmer than the glumes in texture, narrowly lanceolate, rounded on the back, 2.7–4.2 mm long, light green to grayish, often purple-tinged toward the apex, short-hairy along the margins over the back, 3-nerved, the midnerve prolonged as an awn mostly 2–4 mm long; palea about as long as the lemma; anthers 1–2 mm long; $2n = 40$. Desert shrub and juniper communities, on open slopes, and in rock crevices at 1520 to 2130 m in Garfield, Kane, San Juan, and Washington counties; Arizona east to Colorado, Oklahoma, Texas, and in Mexico; 12 (0). *Muhlenbergia wrightii* resembles *L. phleoides* but can readily be distinguished from *Lycurus* by its 1-nerved first glume. See *M. depauperata* for a discussion of its possible relationship to *Lycurus*.

***Melica* L.**

Perennials; culms solitary to densely tufted, some species arising from bulblike corms; sheaths closed throughout or nearly so; blades flat to involute; ligule membranous, sometimes ventrally fused; inflorescence a contracted to open panicle or raceme; spikelets lanceolate to elliptical and subterete to moderately flattened, mostly 3- to 10-flowered, disarticulating above or below the glumes; florets becoming progressively smaller upward, the lower 1–6 perfect, the upper 1–4 reduced to a mostly club-shaped rudiment consisting of one or more empty lemmas; glumes unequal or subequal, ovate to oblong-elliptical, laterally compressed and somewhat keeled to rounded on the backs, membranous at least near the apex, the first (1) 3- to 7-nerved, the second (3) 5- to 9-nerved, shorter or longer than the lowermost floret; fertile lemmas firmer than the glumes, laterally compressed, slightly keeled to rounded on the back, (5) 7- to 15-nerved (the weaker nerves often alternating with more pronounced ones), broadly membranous-margined, awnless (ours) or awned from an entire or bifid apex; callus glabrous; palea shorter than the lemma, often markedly so; stamens 3; caryopsis free within the lemma and palea, the embryo 1/5–2/5 as long as the grain; $x = 9$. Utah species of *Melica* are highly palatable, but populations of even the relatively common *M. bulbosa* are too well dispersed to be of much significance as forage.

Boyle, W. S. 1945. A cytotoxic study of the North American species of *Melica*. *Madrone* 8: 1–26.

1. Spikelets disarticulating above the glumes; pedicels mostly erect-ascending, glabrous to scabrid-puberulent on the upper portion; culms arising from bulblike corms 2
- Spikelets disarticulating below the glumes; pedicels often spreading or recurved, hairy at the summit; culms not distinctly bulblike at the base 3
- 2(1). Corms "threaded" along a rhizome, when detached the rhizome fragments forming "tails" on each corm; first glume averaging less than 6 (3.5–7) mm long, typically becoming membranous throughout, ovate to broadly lanceolate and acute apically *M. spectabilis*
- Corms tightly clustered, not "tailed"; first glume averaging at least 6 (5–11) mm long, mostly opaque, at least in the center, lance-elliptical and obtuse to abruptly acute at the apex *M. bulbosa*

- 3(1). First glume averaging no more than 6 (4–6) mm long; plants rhizomatous, loosely tufted *M. porteri*
 — First glume averaging more than 6 (6–16) mm long; plants densely tufted, not rhizomatous *M. stricta*

***Melica bulbosa* Geyer ex Port. & Coult.** Oniongrass. [*Bromelica bulbosa* (Port. & Coult.) W. A. Weber; *M. bella* Piper]. Perennial; culms solitary or in mostly small tufts, 3–6 (10) dm tall, each usually arising from a swollen, bulblike corm, these typically tightly clustered; sheaths glabrous or scabrous to short-hairy; blades flat to involute, 2–5 mm wide, often short-hairy; ligule 2–5 (7) mm long; panicle sublinear, (7) 10–16 (20) cm long, the short branches mostly erect-appressed; spikelets mostly erect, (6) 9–18 (24) mm long, disarticulating above the glumes and ultimately between the florets, the fertile florets 3–6, the rudiment 1.5–5 mm long; glumes subequal to unequal, lance-elliptical, obtuse to abruptly acute at the pale to tawny or purplish, broadly membranous apex, mostly scaberulous, at least on the nerves, the first (5) 6–9 (11) mm long, 1– to 4–nerved, the second 6–13 mm long, 5– to 7–nerved, typically shorter than the lowermost lemma; lemma (lowermost) lance-elliptical, 6–12 mm long, (5) 7– to 15–nerved, firmer and more conspicuously scabrous than the glumes, usually with a purple band below the pale to brownish membranous tip; anthers 1.3–4 mm long; $2n = 18$. Open, grassy or rocky slopes, in sagebrush, oak, pinyon-juniper, mountain brush, aspen, and ponderosa pine communities, and at upper elevations in montane meadows and on exposed rocky ridges, at 1520 to 3200 m in Beaver, Box Elder, Cache, Carbon, Daggett, Davis, Duchesne, Juab, Millard, Piute, Rich, Salt Lake, Sanpete, Sevier, Summit, Tooele, Uintah, Utah, Wasatch, Washington, and Weber counties; British Columbia and Alberta south through most of the western U. S.; 136 (v).

***Melica porteri* Scribn.** Porter Melic. Rhizomatous perennial; culms loosely tufted, 0.5–1 m tall; sheaths typically glabrous; blades flat to somewhat involute, mostly 2–5 mm wide, smooth or scabrous to hairy; ligule 3–7 mm long; panicle green or tawny, 13–25 cm long, narrow, the branches few, erect or nearly so, often racemose and usually secund, the spikelets loosely spaced, the pedicels erect or abruptly recurved at the puberulent summit; spikelets ascending to drooping, mostly elliptical, 8–16 mm long, disarticulating below the glumes and falling entire, the fertile florets 3–5, the rudiment 2–5 mm long; glumes subequal, subovate to oblanceolate, acute to obtuse at the apex, broadly membranous-margined, glabrous or scaberulous, the first 4–6 mm long, 3– to 5–nerved, the second 5–8 mm long, 5– to 7–nerved, shorter than the uppermost floret; lemma (lowermost) 6–10 mm long, slightly firmer and usually more scabrous than the glumes, pale or green, mostly 7– to 9–nerved, occasionally with a faint purple band below the membranous apex; anthers to ca 2 mm long; $2n = 18$. Known in Utah by a single collection (Thompson s.n. BRY) from an aspen-mountain brush community at 2440 m in San Juan County; Arizona east to Texas and from Colorado south into Mexico; 1 (0).

***Melica spectabilis* Scribn.** Purple Oniongrass. [*Bromelica spectabilis* (Scribn.) W. A. Weber]. Perennial; culms solitary or in mostly small tufts, 2.5–12 dm tall, each arising from a bulblike corm, the corms spaced along a rhizome, usually at intervals of 1–3 cm, a portion

of the rhizome typically forming a "tail" on any corm becoming detached; sheaths mostly glabrous or scabrous; blades flat to involute, 1–5 mm wide, smooth or scabrous; ligule 1–3.2 mm long; panicle usually sublinear, 5–26 cm long, the short branches or pedicels often flexuous, erect-appressed to slightly spreading, scaberulous; spikelets mostly erect, 7–20 mm long, disarticulating above the glumes and ultimately between the florets, the fertile florets 3–7, the rudiment 1.5–3.5 mm long; glumes subequal to unequal, ovate to broadly lanceolate, abruptly acute to acuminate apically, typically becoming membranous and brownish to purple throughout, rarely pale, glabrous or scaberulous on the nerves and sometimes over the back, the first glume 3.5–6 (7) mm long, 1– to 3–nerved, the second 5–7.5 mm long, 7– to 9–nerved, equal to or shorter than the lowermost lemma; lemma (lowermost) ovate to broadly lance-elliptical, 6–9 mm long, firmer and more conspicuously scabrous than the glumes, 7– to 9–nerved, usually purple-banded below the brownish membranous tip or occasionally the tip purplish; anthers 1.8–2.6 mm long; $2n = 18$ (Amer. J. Bot. 64: 103, 1977). Dry to moderately moist sites, chiefly under aspen and in meadows in the spruce-fir zone, less frequent in sagebrush or juniper communities and on open grassy slopes, at 1980 to 3200 m in Cache, Carbon, Daggett, Duchesne, Grand, Rich, Salt Lake, San Juan, Sanpete, Summit, Uintah, Utah, and Wasatch counties; British Columbia and Alberta, south through most of the western U. S.; 45 (0).

***Melica stricta* Bolander** Rock Melic. Perennial; culms densely tufted, 2–6 (8.5) dm tall, more or less thickened but not bulblike at the base; sheaths typically scaberulous, occasionally pubescent; blades flat to somewhat involute, 1.5–3 (5) mm wide, smooth or scabrous to more often short-hairy; ligule 3–5.5 mm long; panicle or raceme mostly pale green or whitish, 3–30 cm long, narrow, the branches few, erect or nearly so, often racemose and more or less secund, the spikelets loosely spaced, the pedicels erect throughout or more often abruptly recurved at the puberulent summit; spikelets spreading to drooping, becoming broadly V-shaped, (8) 10–20 mm long, disarticulating below the glumes and falling entire, the fertile florets 2–5, the rudiment 2–7 mm long; glumes mostly subequal, oblanceolate-elliptical, often broadly so, acute at the apex, pale-membranous and glistening marginally, initially greenish and occasionally purple-tinged medially, glabrous or scaberulous, 5– to 7–nerved, the first 6–16 mm long, the second 7–15 (18) mm long, typically narrowed below to a pedicellike base, the whole often as long as or longer than the uppermost floret; lemma (lowermost) 8–16 mm long, 9–nerved, slightly firmer and usually more scabrous than the glumes, typically pale green to whitish throughout; anthers 1–3 mm long; $2n = 18$. Dry to moist sites, chiefly rocky slopes and open woods at 1520 to 2740 m in Beaver, Box Elder, Juab, and Tooele counties; Oregon, California, and Nevada; 11 (0).

***Muhlenbergia* Schreber**

Annuals or perennials; culms simple or sparingly to freely branched at nodes above the base; sheaths open; blades flat or folded to involute; ligule membranous, rarely obsolete or consisting chiefly or entirely of hairs; inflorescence an open or contracted to spikelet panicle; spikelets whitish or pale to dark gray or less often reddish

purple, terete to somewhat laterally compressed, 1-flowered (occasionally 2- or 3-flowered in *M. asperifolia*, rarely so in other species), disarticulating above the glumes (except in *M. depauperata*); glumes usually membranous, mostly subequal, shorter to longer than the lemma, rounded to acute or short-awned apically, the first 1 (2) -nerved (rarely obsolete), the second 1- to 3-nerved; lemma similar to or firmer than the glumes, mostly rounded on the back, 3 (5) -nerved, often obscurely so, glabrous or variously pubescent, sometimes bearded on the callus, obtuse to acute or awned from the tip, rarely from between minute apical lobes, the awn often flexuous; palea similar to the lemma in texture, shape, and often in length; stamens 3; caryopsis free of but usually remaining enclosed within the lemma and palea, the embryo less than half as long as the grain; $x = 10$. Note: This treatment of *Muhlenbergia* has been reviewed by C. M. Morden.

Pohl, R. W. 1969. *Muhlenbergia*, subgenus *Muhlenbergia* (Gramineae) in North America. Amer. Midl. Naturalist 82: 512-542.

Rehder, C. G. 1949. *Muhlenbergia minutissima* (Steudel) Swallen and its allies. J. Wash. Acad. Sci. 39: 363-367.

1. Panicles at maturity open; pedicels averaging longer than the spikelets (excluding awns) 2
- Panicles narrow, compact or occasionally loose to open, and then the pedicels averaging shorter than the body of the lemma 5
- 2(1). Lemmas terminating in an awn 3-20 mm long; plant perennial, tufted from a hard, knotty base ... *M. porteri*
- Lemmas awnless or with an awn to 2 mm long, plants annuals or strongly rhizomatous perennials 3
- 3(2). Lemmas 4-6 mm long including the short awn; basal sheaths (sometimes only the inner ones) woolly-hairy; leaf blades typically pungent-tipped *M. pungens*
- Lemmas 2 mm long or less; basal sheaths glabrous or scaberulous; leaf blades soft or firm but not pungent-tipped 4
- 4(3). Annual with fibrous roots; glumes mostly blunt, often minutely ciliate at the apex or short-hairy over the back *M. minutissima*
- Perennial from scaly rhizomes; glumes mostly acute and glabrous or scabrous *M. asperifolia*
- 5(1). First glume conspicuously 2-nerved and usually bifid at the apex, the second glume 1-nerved; panicle branches disarticulating at the base and falling with the spikelets; plants annual, much branched from the lower nodes *M. depauperata*
- First glume 1 (3) -nerved, rarely obsolete; plants not otherwise as above 6
- 6(5). Second glume 3 (5) -nerved, typically 3-toothed at the apex; ligule 4-20 mm long *M. montana*
- Second glume 1 (3) -nerved but not 3-toothed; ligule rarely more than 3.5 mm long 7
- 7(6). Panicles both terminal and axillary; glumes with an awn-tip to 1.5 mm long; anthers to 0.5 mm long ... *M. mexicana*
- Panicles all terminal on culms or culm branches; plants otherwise variable 8
- 8(7). Lemmas awned, the awns averaging more than 1 (1-25) mm long 9
- Lemmas awnless or with awn-tips averaging no more than 1 mm long 13
- 9(8). Glumes averaging not more than 1 mm long (often rudimentary or obsolete in *M. schreberi*) 10
- Glumes averaging more than 1 mm long 11
- 10(9). Awns mostly 10-20 mm long; panicles loose to open, often purple *M. microsperma*
- Awns 1-5 mm long; panicles contracted, typically green *M. schreberi*
- 11(9). Lemma densely bearded from the base, the hairs about equal to the body; glumes equal to or exceeding the body of the lemma; leaf blades often flat, 1.5-5 mm wide, mostly 5-12 cm long *M. andina*
- Lemma glabrous to variously pubescent, the hairs shorter than the body; glumes shorter than the body of the lemma or, if longer, the leaf blades to 1.5 (2) mm wide and mostly 1-3 cm long (the two taxa below sometimes intergrading) 12
- 12(11). Sheaths glabrous; glumes averaging not more than 2/3 as long as the lemma; ligule averaging more than 1 (1-5) mm long; leaf blades mostly 1-15 cm long and strongly ascending; lemmas glabrous or short-hairy, the awns averaging at least 6 (5-25) mm long *M. pauciflora*
- Sheaths typically pubescent; glumes averaging more than 2/3 as long as the lemma; ligule 0.2-0.8 mm long; leaf blades typically 1-3 cm long and stiffly spreading; lemmas pubescent with hairs to ca 1.5 mm long, the awns usually less than 6 (0.8-10) mm long *M. thurberi*
- 13(8). Glumes awned or awn-tipped 14
- Glumes awnless, obtuse to acute at the apex 16
- 14(13). Glumes with an awn almost as long as the body, the whole 3-8 mm long *M. racemosa*
- Glumes with an awn distinctly shorter than the body, the whole to 3.8 mm long 15
- 15(14). Lemmas pubescent with hairs to ca 1.5 mm long ... *M. thurberi*
- Lemmas glabrous to minutely hairy *M. wrightii*
- 16(13). Lemmas pubescent with hairs mostly ca 1.5 mm long *M. thurberi*
- Lemmas glabrous to minutely hairy 17
- 17(16). Plants annual (rarely perennial) from hairlike fibrous roots; anthers 0.2-1 mm long, culms not distinctly nodulose *M. filiformis*
- Plants perennial from slender, knotty rhizomes; anthers at maturity more than 1 mm long, sometimes only slightly so; culms typically nodulose at least above (at 20x magnification) 18
- 18(17). Lemmas averaging more than 2.7 (2.5-4) mm long (including the awn-tip); glumes 1.5-3 mm long, typically more than half as long as the lemma; plants known from a single, low-elevation population in Kane County *M. repens*
- Lemmas averaging no more than 2.7 (1.8-3) mm long; glumes 0.6-1.8 mm long, mostly not more than half as long as the lemma; plants of montane areas, widely distributed *M. richardsonis*

Muhlenbergia andina (Nutt.) A. S. Hitchc. Foxtail Muhly. [*Calamagrostis andina* Nutt.]. Perennial from somewhat coarse, scaly rhizomes; culms 2.5-6 (10) dm tall, erect, simple or sparingly branched; leaves chiefly cauline, green or glaucous; sheaths glabrous or minutely hairy; blades flat to loosely involute, mostly 5-15 cm long and 1.5-4 (5) mm wide, scaberulous; ligule 0.5-1.3 mm long, truncate; panicle spikeletlike to narrowly oblong, compact or sometimes loose, often interrupted or lobed, 4-16

cm long and to ca 2 cm wide, the primary branches mostly 0.5–5 cm long, erect-appressed to slightly spreading, the pedicels mostly shorter than the body of the lemma; spikelets 1-flowered, 2.5–4.5 mm long (excluding the awn), whitish to gray green, occasionally purple-tinged; glumes narrowly lanceolate, subequal, the larger 2.5–4.5 mm long, equal to or exceeding the body of the lemma, prominently 1-nerved, gradually tapered to a sharply acute to awnlike tip; lemma similar to the glumes in texture and shape, 1.8–3.2 mm long, 3-nerved, tapered to a hairlike awn 2–10 mm long, the callus densely bearded with silky hairs about as long as the body of the lemma; palea equal to or more often slightly exceeding the lemma; anthers 0.4–0.7 mm long; $2n = 20$. Streamside, moist sandy soil, and wet rock faces at 1370 to 2900 m in Cache, Carbon, Daggett, Garfield, Grand, Iron, Kane, Rich, San Juan, Sanpete, Sevier, Summit, Uintah, Utah, Washington, and Wayne counties; throughout the western U. S., rare in Texas; 46 (i).

***Muhlenbergia asperifolia* (Nees & Mey.) Parodi** Scratchgrass. [*Sporobolus asperifolius* Nees & Mey.]. Yellow green to glaucous perennial from long, slender, scaly rhizomes, occasionally stoloniferous; culms 1–5 (10) dm tall, slender, decumbent-ascending, often branched, especially near the base; leaves chiefly cauline; sheaths glabrous; blades ascending to spreading, flat or folded, mostly 2–8 (14) cm long and 1–2.5 (3) mm wide, essentially glabrous or more often scaberulous to scabrid-puberulent; ligule 0.2–1 mm long, truncate; panicle open, mostly 5–25 cm long and nearly as wide, branches and hairlike pedicels ultimately widely spreading, the pedicels much longer than the spikelets, the entire panicle usually breaking off at maturity; spikelets 1 (2 or 3)-flowered, 1.2–2 mm long, pale to dark gray, often purple-tinged; glumes subequal, the larger 0.7–1.7 mm long, considerably shorter to slightly longer than the lemma, 1-nerved, sometimes obscurely so, mostly sharply acute at the apex, glabrous or more often scabrous on the nerve and sometimes over the back; lemma lanceolate to elliptical or ovate, 1.2–2 mm long, 3-nerved, glabrous, obtuse to minutely awn-tipped at the apex; palea as long as the lemma or nearly so; anthers to 1.2 mm long; $2n = 20, 22, 28$. Wet or drying, often alkaline or saline sites, along waterways and in meadows, in salt desert shrub, sagebrush, and pinyon-juniper communities, often on disturbed sites, at 1000 to 2130 m in all Utah counties except Daggett, Davis, Iron, Morgan, Sanpete, and Wasatch; British Columbia to Manitoba, south throughout the western half of the U. S. and into Mexico, sporadic in the central states east to Ohio; South America; 144 (vi). The caryopsis of *M. asperifolia* is frequently infected by a smut fungus (*Tilletia asperifolia* Ellis & Everhart), producing a globose black body.

***Muhlenbergia depauperata* Scribn.** Sixweeks Muhly. Annual; herbage glabrous or scabrous to puberulent; culms 2–15 cm tall, much branched from the lower nodes, erect to ascending; sheaths glabrous or puberulent; blades flat or loosely involute on drying, 0.5–1.5 mm wide and to ca 3 cm long; ligule 1.5–4.5 mm long, generally split near the margins, the lateral portions auriclelike; panicle spikeletlike, often partially included in the uppermost sheath, 1–6 (7) cm long and to ca 5 mm wide, each short branch appressed to the rachis, bearing 1–3 spikelets, and disarticulating at the base; spikelets 1-flowered, 2.5–3.5 mm long (excluding awn when

present), disarticulating (if at all) above the glumes; glumes narrowly lanceolate, subequal, typically scaberulous, the first 2-nerved and usually bifid at the apex, 2.5–3.5 mm long, the second 1-nerved and acute or tapered to an awn tip 0.5–2 mm long, to 3.8 mm long overall, often equal to or exceeding the body of the lemma; lemma lanceolate, 2.5–3.5 mm long, conspicuously 3-nerved, usually minutely pubescent with appressed hairs between the nerves, the apex acute or the midnerve prolonged as an awn to 10 mm long; palea about as long as the lemma, usually minutely hairy between the nerves; anthers 0.5–0.8 mm long; $2n = 20$. Sagebrush and pinyon-juniper communities at 1520 to 2130 m in Beaver and San Juan counties, first collected in Utah in 1983 (Welsh 22448 BRY); Arizona, New Mexico, Texas; Mexico; 3 (0). Because *M. depauperata* has the same distinctive morphology and the same basic chromosome number as *Lycurus phleoides*, inclusion of this species in the genus *Lycurus* where it was placed (as *L. schaffneri*) by C. Mez (Repert. Sp. Nov. Regni Veg. 17: 212. 1921) would seem a more rational treatment than this, the currently accepted one.

***Muhlenbergia filiformis* (Thurber) Rydb.** Pullup Muhly. [*Vilfa depauperata* var. *filiformis* Thurber, type from Uinta Mts., Summit County]. Annual or occasionally a short-lived, fibrous-rooted perennial; culms slender, 0.2–3 (4) dm tall, simple to freely branched from the base, sparingly so above, erect to ascending, not distinctly nodulose, often rooting at the lower nodes; sheaths glabrous; blades flat or involute near the tips, mostly 0.3–2 mm wide and rarely more than 3 cm long, scaberulous on the margins and often puberulent; ligule 1–3.5 mm long, obtuse to acute; panicle linear to narrowly oblong, 0.5–5 (9) cm long, usually interrupted, the short branches erect to slightly divergent, the pedicels much shorter to slightly longer than the spikelets; spikelets 1-flowered, 1.5–2.5 mm long, greenish or more often pale to dark gray, sometimes mottled; glumes ovate to fan-shaped, subequal, 0.5–1.8 (2) mm long, much shorter than the lemma, both 1-nerved, often scaberulous near the acute to rounded, entire or erose apex; lemma lanceolate, 1.5–2.5 mm long, 3-nerved, often conspicuously so, sometimes appearing fluted, usually sparsely short-hairy laterally or along the midrib and scabrous toward the acute to mucronate or awn-tipped apex; palea as long as the body of the lemma or nearly so; anthers 0.2–1 mm long; $2n = 18$. Wet meadows or other moist to mesic places in sagebrush-grass, aspen, spruce-fir, and lodgepole pine communities at 1280 to 3200 m in Cache, Duchesne, Emery, Garfield, Iron, Juab, Kane, Salt Lake, Sanpete, Sevier, Summit, Tooele, Uintah, Utah, and Wasatch counties; British Columbia south throughout the western U. S. and into Mexico, occasional in the Great Plains; 121 (vi). *Muhlenbergia filiformis* is occasionally mistaken for *M. filiculmis* Vasey, which differs from *M. filiformis* in being perennial and in having the second glume 3-nerved and 3-toothed as in *M. montana* (q.v.). I have seen no Utah plants that can be identified as *M. filiculmis*.

***Muhlenbergia mexicana* (L.) Trin.** Mexican Muhly. [*Agrostis mexicana* L.; *M. ambigua* Torr.; *M. foliosa* ssp. *ambigua* (Torr.) Scribn.]. Perennial from stout, scaly rhizomes; culms 3–10 dm tall, erect or ascending, simple below and branching from the middle and upper nodes; sheaths glabrous or nearly so; blades lax, flat, 1.5–6 mm

wide and mostly 4–15 cm long, scaberulous; ligule 0.4–1.5 mm long, truncate to acute; panicles both terminal and axillary, narrow, often interrupted, 3–21 cm long and 2–12 mm wide, often partly included in the uppermost sheath, the branches typically erect, densely flowered to the base, the pedicels much shorter than the spikelets; spikelets 1-flowered, 2–4.4 mm long, pale green, sometimes purple-tinged; glumes narrowly lanceolate to elliptical, subequal, 2–4.4 mm long, 1-nerved, the nerve prolonged as an awn 0.5–1.5 mm long, the body of the glume equal to or slightly shorter than the body of the lemma; lemma narrowly lanceolate, the body 2–4.4 mm long, 3-nerved, the callus bearded with hairs 0.2–1.5 mm long, the apex sharply acute to awn-tipped or with an awn to about 6 mm long; palea about as long as the body of the lemma; anthers 0.3–0.5 mm long; $2n = 40$. Along waterways and in other moist, often disturbed sites below 1520 m in Utah and Grand counties; Alaska and British Columbia to Nova Scotia, sporadic in the U. S. except in the Southeast; 4 (0). *Muhlenbergia mexicana* is sometimes confused with *M. frondosa* (Poir.) Fern. of the eastern states. In *M. frondosa*, however, the internodes of the culm are shiny and glabrous rather than dull and scabrous to pubescent as in our plants (Gould 1975).

Muhlenbergia microsperma (DC.) Kunth Littleseed Muhly. [*Trichochloa microsperma* DC.]. Annual or short-lived perennial; culms 0.5–6 (7) dm tall, much branched at the lower nodes, sparingly so above, erect or decumbent, often geniculate at the nodes; sheaths loose, glabrous or scaberulous; blades often deciduous, flat or loosely involute, 1–6 (10) cm long and 1–1.5 (2) mm wide, scaberulous to short-hairy; ligule 0.5–2 mm long, truncate, erose, and soon splitting vertically; panicle narrow, loosely flowered, 2–20 cm long, the branches mostly less than 3 cm long, erect to more or less spreading, the pedicels rather stout, scabrous to scabrid-puberulent, averaging shorter than the spikelets; spikelets 1-flowered, 2–4 mm long, often purple; glumes unequal or subequal, ovate to oblong, averaging no more than 1 mm long, broadly acute to rounded at the apex, 1(2)–nerved, glabrous or the midnerve scaberulous; lemma narrowly lanceolate, 2–3.5 (4) mm long, 3-nerved, sometimes obscurely so, short-hairy on the lower 1/4–1/3, scabrous above, the midnerve prolonged from between minute teeth as a hairlike awn mostly 10–20 mm long; palea slightly shorter than the lemma; anthers 0.3–1 mm long. Dry rocky sites, often in the shelter of desert shrubs or cacti, in creosote bush communities at about 1070 m in Washington County; California, Nevada, Arizona, and Mexico; South America; 7 (0). Cleistogamous spikelets are usually present in the axils of the lowermost culm branches of *M. microsperma*. They develop within a short, hardened, reduced sheath, lack glumes, have a short-awned lemma, and a caryopsis more rounded than those of the chasmogamous florets.

Muhlenbergia minutissima (Steudel) Swallen Annual Muhly. [*Agrostis minutissima* Steudel]. Annual; culms slender, mostly 0.5–3.5 dm tall, simple or branched from the base, erect or ascending; leaves often chiefly basal; sheaths essentially glabrous; blades flat to weakly involute near the tips, mostly 1–6 cm long and 0.3–1.5 (2) mm wide, scaberulous to puberulent; ligule 1–2.5 (3) mm long, truncate, erose, and soon splitting vertically; panicle ultimately open, 2–18 cm long, usually 1/2–3/4 the height of the plant, and to about 4 cm wide, the branches

soon spreading, the pedicels hairlike, ascending-spreading, averaging longer than the spikelets; spikelets 1-flowered, 0.8–1.8 mm long, greenish to straw colored, often purple-tinged; glumes subequal, elliptical to lanceolate or ovate, 0.6–1 mm long, shorter than the lemma, 1-nerved, acutish to rounded and often minutely ciliate at the apex, usually sparsely short-hairy over the back; lemma lanceolate to elliptical, 0.8–1.8 mm long, obscurely nerved, glabrous or more often sparsely short-hairy below, obtuse to acute or awn-tipped; palea about equal to the lemma; anthers 0.3–0.6 mm long; $2n = 60, 80$. Dry to mesic sites in openings in sagebrush, pinyon-juniper, and aspen-spruce communities at 1830 to 2740 m in Beaver, Iron, and Sevier counties, also reported [as *Sporobolus confusus* (Fourn.) Vasey] from Tooele County by Flowers (Bot. Gaz. 95: 405. 1934); throughout the western U. S., and in Texas and Mexico, rare in the Great Plains; 9 (0).

Muhlenbergia montana (Nutt.) A. S. Hitchc. Mountain Muhly. [*Calycodon montanum* Nutt.]. Tufted perennial; culms slender to moderately robust, 0.6–8 (9) dm tall, erect or sometimes decumbent at the much branched base; leaves chiefly basal, often glaucous; sheaths glabrous or scaberulous, old sheath bases persistent, often broad and loose, becoming conspicuously flattened; blades typically stiffly erect or ascending, flat or more often involute, mostly 6–25 cm long and 1–2 mm wide, more or less scabrous; ligule 4–14 (20) mm long, acute, entire; panicle sublinear to loose and narrowly oblong, 2–25 cm long, the branches mostly 1–9 cm long, erect to moderately spreading, the pedicels averaging shorter than the body of the lemma; spikelets 1-flowered, 2.5–4.5 mm long excluding awns, greenish to tan or pale to dark gray, sometimes whitish or purple-tinged; glumes equal or unequal, usually scabrous on the keel and sometimes across the back, the first lanceolate to ovate, 1–3 mm long, 1 (3)–nerved, acute to mucronate or awn-tipped, the second ovate to elliptical, 1.5–3.2 mm long, 3 (5)–nerved, 3-toothed or some of them erose and then more or less truncate, both glumes shorter than the lemma; lemma firmer than the glumes, lanceolate, 2.5–4 (4.5) mm long, 3-nerved, usually obscurely so, often mottled with dark gray, the callus short-bearded, the body variously hairy on the lower portion or laterally nearly to the apex, typically scabrous above, gradually tapered to a slender flexuous awn 2–12 (20) mm long, or occasionally sharply acute to awn-tipped; palea about equal to the body of the lemma; anthers 1.5–2.3 mm long; $2n = 40$. Dry to moist sites on grassy slopes and in openings in sagebrush, aspen, spruce-fir, and ponderosa pine communities at 1830 to 3295 m in Beaver, Garfield, Grand, Iron, San Juan, Washington, and Wayne counties; sporadic in the western U. S.; 81 (0). Vasey (Contr. U.S. Natl. Herb. 1: 267–280. 1893) separated *M. montana* Vasey from *M. filiculmis*, with which Utah plants have occasionally been confused, on purely quantitative bases: culms filiform, ligules to 2 mm long, lemma awns about 1 mm long. As currently interpreted, however, the range of variation in the two taxa is continuous or overlapping. The type specimen of *M. filiculmis* (US) reveals no basis for distinguishing it from *M. montana* other than the quantitative characters mentioned above. In view of the random nature of the variation and the existence of numerous intermediates, it is possible that size is related to microhabitat, and that the name *M. filiculmis* has been

applied to depauperate specimens of *M. montana*. Mountain muhly is a good source of forage early in the year but becomes unpalatable at maturity unless fully grazed throughout the growing season (Valentine 1961). The species appears to have potential for use in land reclamation.

Muhlenbergia pauciflora Buckley New Mexican Muhly. Tufted perennial, rarely short-rhizomatous; culms 1–7 dm long from a hard, knotty base, erect or ascending to spreading, sometimes geniculate and rooting at the lower nodes, simple or sparingly to freely branched chiefly below midlength; leaves chiefly cauline; sheaths glabrous; blades typically involute-filiform or rarely flat and to ca 1.5 mm wide, mostly 1–15 cm long and strongly ascending, scaberulous or scabrous to occasionally short-hairy; ligule 1–5 mm long, often split, the lateral, auriclelike projections exceeding the central portion; panicle narrow but frequently loose, mostly 2–15 cm long, the primary branches 0.5–6 cm long, erect-appressed to slightly spreading, the pedicels erect, scabrid-puberulent, averaging shorter than the body of the lemma; spikelets 1 (2) –flowered, (3) 3.5–5.5 mm long, often reddish purple, occasionally greenish white; glumes lanceolate, subequal, (1.5) 2–3.5 mm long, the longer glume 1/2–2/3 as long as the lemma, 1–nerved, acute to awn-tipped, rarely subacute to obtuse, entire to minutely erose at the apex; lemma narrowly lanceolate, (3) 3.5–5.5 mm long, glabrous or scabrous to sparsely hairy, the hairs usually minute, often arising just above the callus or along the lower lateral margins (lemma pubescence variable within a panicle), gradually tapered to a hairlike awn (5) 7–25 mm long; palea about equal to or slightly exceeding the body of the lemma; anthers 1.5–2.7 mm long. Desert shrub, sagebrush, juniper, pinyon-juniper, and ponderosa pine communities at 1520 to 2130 m in Beaver, Garfield, Kane, Millard, San Juan, Washington, and Wayne counties; California, Colorado, Arizona, New Mexico, western Texas, and Mexico; 21(0). *Muhlenbergia arsenei* is reported for Utah by Hitchcock (1951). As originally described (Proc. Biol. Soc. Wash. 41: 161. 1928), *M. arsenei* differs from *M. pauciflora* in having a ligule only 1 mm long and glumes "somewhat hispidulous toward the awnless and rounded tips." The paratype cited by Hitchcock (Rydberg and Garrett 9498 UT) is, however, a specimen of *M. pauciflora* with ligules longer than 1 mm and glumes sharply acute. Both *M. pauciflora* (Welsh & Moore 2508 BRV) and *M. thurberi* (Rydb. & Garrett 9511 UT) have been collected from the paratype locality for *M. arsenei*. Under these circumstances, it appears possible that *M. arsenei*, with the short leaves and rounded glumes of *M. pauciflora* and the awns of the lemmas intermediate between those of *M. thurberi* and *M. pauciflora*, may have been based on a hybrid between the two taxa. *Muhlenbergia polycaulis* Scribn., reported for Utah by Tidestrom (1925); differs from *M. pauciflora* in being consistently rhizomatous and in having shorter ligules (0.5–1 mm long), glumes with an awn to 1.5 mm long, and smaller lemmas (2.3–3.5 mm long) densely hairy over the lower 1/2–2/3 (Gould 1975). I have seen no Utah material matching Gould's description of *M. polycaulis*. See *M. thurberi* for discussion of the possibility of hybridization between that species and *M. pauciflora*.

Muhlenbergia porteri Scribn. ex Beal Bush Muhly. [*M. texana* Thurber]. Tufted perennial from a hard knotty base; culms mostly 1.5–10 dm tall, sparingly branched

above the base, ascending-spreading, typically geniculate at some or all the numerous, often swollen nodes; leaves chiefly cauline; sheaths glabrous or scabrous, those below loose and becoming more or less flattened; blades soft, flat, mostly 1.5–6 cm long and 0.5–2 mm wide, scaberulous; ligule 1–2 mm long, often vertically split laterally; panicle ultimately open, mostly 4–10 cm long and at maturity nearly as broad, the branches and hairlike pedicels ultimately widely spreading, the latter averaging longer than the body of the lemma; spikelets 1–flowered, 2–5 mm long (excluding awns), often reddish purple; glumes narrowly lanceolate, equal or unequal, 1 (3) –nerved, acute or the midnerve of at least the second glume often prolonged as an awn-tip or as an awn to about 3 mm long, the body of the glumes 1.5–3 mm long, shorter than the lemma; lemma narrowly lanceolate, 2–4 (5) mm long, 3–nerved, sparsely pubescent between the nerves and laterally, terminating in a hairlike awn 3–20 mm long; palea about equal to the body of the lemma; anthers 1.6–2.5 mm long; 2n = 20, 40. Dry, mostly rocky or sandy sites on open hillsides, in creosote bush and desert shrub communities, at 760 to 1310 m in San Juan, Washington, and Wayne counties; southwestern U. S. from California east to Colorado, Texas, and Mexico, rare in Oklahoma; 21 (0). Bush muhly is highly palatable to all classes of livestock but is not sufficiently abundant in Utah to provide a significant source of forage.

Muhlenbergia pungens Thurber in Gray Sandhill Muhly. Glaucous perennial from coarse scaly rhizomes, often forming large rounded clumps and dying out in the center; culms 1–6 (7) dm tall, erect or more often decumbent-ascending, usually much branched just above the base; sheaths mostly woolly-hairy at the base, essentially glabrous above; blades rigid, involute, typically pungent-tipped, 2–6 (8) cm long and to ca 1 mm wide, glabrous to puberulent; ligule 0.2–1 mm long, often with membranous lateral lobes, occasionally appearing to consist of a ring of hairs; panicle ultimately open, (7) 8–15 (18) cm long and 2–8 cm wide, the branches and hairlike pedicels ultimately widely spreading, the pedicels to ca 1.5 cm long, averaging much longer than the spikelets; spikelets 1 (2) –flowered, 4–6 mm long (including awns), mostly red purple to brownish; glumes lanceolate to ovate, subequal, 1 (3) –nerved, entire or erose to 3-toothed, often awn-tipped, the whole 1.2–4 mm long, considerably shorter than the lemma, scaberulous above or nearly throughout; lemma narrowly lanceolate, gradually tapered to a short awn 1–1.5 (2) mm long, the whole 4–6 mm long, glabrous throughout or sparsely short-hairy near the base; palea equal to or slightly longer than the body of the lemma, the 2 nerves prolonged as awn-tips; anthers 1.3–2.5 mm long; 2n = 42, 60. Desert shrub, sagebrush-juniper, and pinyon-juniper communities at 1070 to 1950 m in Emery, Garfield, Grand, Kane, San Juan, and Wayne counties; Wyoming, Colorado, Arizona, New Mexico and Texas, east to South Dakota and Nebraska; 98 (iii).

Muhlenbergia racemosa (Michx.) B.S.P. Green Muhly. [*Agrostis racemosa* Michx.]. Perennial from long scaly rhizomes; culms 2.5–10 (13) dm tall, typically erect, simple or more often branching at or above the base, often from the nodes at midlength, the internodes glabrous to puberulent; leaves chiefly cauline; sheaths glabrous or scaberulous; blades soft, flat or loosely involute, to ca 15 cm long and mostly 2–6 mm wide, scabrous; ligule 0.2–1 (1.5) mm long, truncate; panicle spikelike to narrowly

oblong, 4–18 cm long and 0.3–0.7 (1.5) cm wide, often lobed or interrupted, the branches 0.5–2 cm or more long, erect to slightly spreading, the lowermost branch often somewhat remote, the pedicels shorter than the spikelets; spikelets 1-flowered, 2.2–4.5 mm long including the awn-tip, usually greenish, occasionally purpletinged; glumes narrowly lanceolate, equal or subequal, the solitary scabrous nerve prolonged as an awn often as long as the body or nearly so, the whole 3–7.5 (8) mm long, exceeding the lemma; lemma narrowly lanceolate, acute or awn-tipped, the whole 2.2–4 (4.5) mm long, 3-nerved, often mottled with black, pubescent on the lower half and sometimes along the margin almost to the apex, the hairs to ca 1 mm long; palea about equal to the lemma; anthers 0.4–1 (1.5) mm long; $2n = 20, 40$. Dry to moist sites, on open slopes, in hanging gardens, in mountain brush, aspen, ponderosa pine, and meadow communities, and a weed of gardens, at 1220 to 3050 m in Duchesne, Garfield, Grand, Piute, Salt Lake, San Juan, Uintah, Utah, Washington, Wayne, and Weber counties; Alaska and British Columbia to Newfoundland, south in the U. S. except in the Southeast; 22(i). Pohl (1969) recognizes two species in this widespread complex, separating them as follows:

1. Internodes of the culm dull, puberulent; ligules 0.2–0.6 mm long; anthers 0.8–1.5 mm long; lemma pilose at the base and along the margins; species of wet sites
 *M. glomerata* (Willd.) Trin.
- Internodes of the culm smooth and polished except near the summit, ligules 0.6–1 mm long; anthers 0.5–0.8 mm long; lemma pilose at the base only; species of dry open sites *M. racemosa*

According to Pohl (1969), both species are present in Utah. Although the total range of variation for both forms can be seen in our plants, the characters as outlined above are not consistently correlated, either in Utah material or in numerous North American specimens examined at the National Herbarium. Under these circumstances, the validity of recognizing *M. glomerata* as a distinct species appears to need additional scrutiny.

Muhlenbergia repens (Presl) A. S. Hitchc. Creeping Muhly. [*Sporobolus repens* Presl]. Perennial with hard shiny rhizomes; culms often loosely tufted, wiry, freely branched above the base, 0.6–3.5 dm tall, the sterile culms decumbent, the flowering ones erect, usually smooth below and nodulose to some degree above; leaves chiefly cauline; sheaths usually glabrous; blades flat or soon involute, mostly 1–2 mm wide, those of the sterile shoots to as much as 9 cm long, those of the flowering culms 1–3 (5) cm long and often recurved; ligule 0.5–1 mm long, acute to obtuse; panicles terminal and axillary, narrow, 1–6 cm long, the spikelets loosely spaced along the rachis on erect or slightly spreading pedicels averaging shorter than the spikelets; spikelets 1 (2) -flowered, 2.5–4 mm long, pale green to gray; glumes lanceolate to ovate, subequal, 1.5–3 mm long, averaging at least half as long as the body of the lemma, 1-nerved, typically acute, glabrous or scaberulous on the midnerve; lemma typically a darker gray than the glumes, lanceolate, 2.5–4 mm long including the awn tip; 3-nerved, the lateral nerves sometimes obscure, glabrous or scaberulous, acute or tapered to an awn tip to ca 0.5 mm long; palea about as long as the lemma; anthers 1.2–1.5 mm long; $2n = 72$. This low-elevation plant is represented in Utah by a single collection

(Morden 649 UT) from a small population in a sagebrush community at 1615 m in Kane County; Nevada and Arizona to Texas; Mexico; 1 (0).

Muhlenbergia richardsonis (Trin.) Rydb. Mat Muhly. [*Vilfa richardsonis* Trin.; *M. squarrosa* (Trin.) Rydb.]. Mat-forming perennial from slender knotty rhizomes; culms slender, 0.5–6 (7) dm tall, erect or decumbent-ascending, often geniculate at the lower nodes, typically much branched at or near the base, usually nodulose (at 10–20x magnification); leaves chiefly cauline; sheaths glabrous; blades flat or more often involute, 0.5–1.8 (2) mm wide, 1–5 (9) cm long, scaberulous to puberulent; ligule 1–3 mm long, acute; panicles terminal and often axillary, narrow, (1) 2–7 (10) cm long, mostly exserted from the upper sheath, often somewhat interrupted, the short branches erect or slightly divergent, the pedicels averaging shorter than the spikelets; spikelets 1-flowered, 1.8–3 mm long including the awn tips, greenish or more often pale to dark gray; glumes ovate, subequal, 0.6–1.5 (1.8) mm long, much shorter than the lemma, obtuse to acute, occasionally minutely erose at the apex, glabrous or scaberulous on the midnerve, the first 1-nerved, the second 1 (3) -nerved; lemma lanceolate, 1.8–2.8 (3) mm long, 3-nerved, usually obscurely so, glabrous or scaberulous, acute or mucronate to awn-tipped; palea about as long as the lemma; anthers 1–1.8 mm long; $2n = 40$. Dry to moist sites in sagebrush, mountain brush, pinyon-juniper, aspen-spruce-fir, ponderosa pine, and meadow communities, occasionally on open slopes, at 1680 to 3200 m in Beaver, Box Elder, Cache, Carbon, Daggett, Duchesne, Emery, Garfield, Grand, Iron, Piute, Rich, Salt Lake, San Juan, Sanpete, Sevier, Summit, Uintah, Utah, Wasatch, Washington, and Wayne counties; Alaska and Yukon to New Brunswick, south throughout the western U. S. and into Mexico, east in the Great Plains as far south as Nebraska, rare in the eastern states; 110 (vii).

Muhlenbergia schreberi J. F. Gmel. Nimblewill Muhly. Perennial, often appearing annual, sometimes stoloniferous; culms lax, 1–6 dm long, erect or ascending to prostrate and rooting at the nodes, simple or branched above the base; leaves evenly distributed along the culm; sheaths glabrous or with a few long hairs near the summit; blades soft, flat, mostly 1–3 (4) mm wide and 3–8 cm long, glabrous or sparsely hairy near the ligule; ligule to 0.5 mm long, truncate, sometimes evidently lacking or consisting of short hairs; panicle linear to somewhat loose, mostly 4–15 cm long and to about 6 mm wide, often nodding, the short branches erect to slightly spreading, the pedicels erect, averaging shorter than the body of the lemmas; spikelets 1-flowered, 2–2.5 mm long excluding awns, usually greenish; glumes obsolete or the second to about 0.4 (1) mm long; lemma narrowly lanceolate, 2–2.5 mm long, often mottled with black, 3-nerved, typically puberulent near the base, terminating in a hairlike awn 1–5 mm long; palea about equal to the body of the lemma; anthers 0.1–0.4 mm long; $2n = 40$. Known in Utah by a single collection (Deming s.n. UTC) at about 1200 m from a dry hillside in Washington County; Colorado, Arizona, Texas, and Mexico, and from Ontario south throughout the eastern U. S.; South America; adventive in many subtropical countries; 1 (0).

Muhlenbergia thurberi Rydb. Thurber Muhly. [*M. curtifolia* Scribn., type from Kane County]. Glaucon perennial from slender rhizomes; culms wiry, mostly 1–6

dm tall, solitary or tufted, erect or decumbent-based, often loosely branched above the base; leaves chiefly cauline; sheaths typically pubescent; blades soft or more often pungent-tipped, flat or involute toward the tips, 1–1.5 (2) mm wide and mostly 1–3 cm long, usually widely spreading, often puberulent; ligule 0.2–0.8 mm long, lacking lateral projections; panicle sublinear to narrow, 2–8 (9) cm long, often more or less interrupted, the short branches erect or slightly divergent, the pedicels scabrid-puberulent, averaging shorter than the spikelets; spikelets 1 (2) –flowered, 2.5–4.5 mm long excluding the awn, greenish white, occasionally tinged with rose or purple; glumes lanceolate, subequal, (2) 2.5–4 mm long, often nearly as long as the lemma, usually purple-tinged, acute or tapered to awnlike tips, essentially glabrous or scaberulous on the upper half of the midnerve, the first 1–nerved, the second 1– to 3–nerved; lemma narrowly lanceolate, the body 2.5–4.5 mm long, 3–nerved, pubescent in part or throughout with hairs to ca 1.5 mm long, sharply acute or more often awned, the awn 0.8–7 (10) mm long; palea about equal to or slightly longer than the body of the lemma; anthers 1–2 mm long. Dry to moist, often sandy or rocky sites, in hanging gardens, desert shrub, pinyon-juniper, and ponderosa pine communities at 1130 to 2500 m in Garfield, Grand, Kane, San Juan, Washington, and Wayne counties; Nevada, Arizona, and New Mexico; 29(0). *Muhlenbergia curtifolia* is reduced to synonymy by Cronquist et al. (1977), who found the asserted distinctions between *M. curtifolia* and *M. thurberi* difficult to detect. Although *M. thurberi* and *M. pauciflora* are usually easily separable according to the characters cited in the key, occasional specimens (e.g., Welsh 21384 BRY and Albee 3414 UT) combine the characters of both, suggesting that hybridization is occurring where their ranges overlap.

Muhlenbergia wrightii Vasey ex Coult. Spike Muhly. Tufted perennial from a usually knotty base, occasionally with elongate, decumbent tillers and appearing rhizomatous; culms wiry, 1–5 (6) dm tall, erect or occasionally somewhat decumbent at the base, simple or more often sparingly branched above the base, sometimes obscurely nodulose; sheaths glabrous or scabrous to puberulent; blades soft, typically folded or involute, 0.5–2 mm wide and to about 15 cm long, scaberulous to puberulent; ligule 0.8–2 (3) mm long, truncate or obtuse to acute; panicle spikeletlike, 1–15 cm long, 0.2–1 cm wide, often interrupted, the short branches erect, the lowermost often more or less remote, the pedicels much shorter than the spikelets; spikelets 1 (2) –flowered, 3–4.5 (5) mm long including the awn tips, greenish white or more often pale to dark gray; glumes ovate to lanceolate, subequal, mostly 0.6–2 mm long, the solitary scabrous nerve generally prolonged as an awn tip 0.2–1 mm long, the whole shorter than the lemma; lemma narrowly lanceolate, gradually tapered to a short awn tip averaging less than 1 mm long, mostly 3–5 mm long overall, 3–nerved, sometimes obscurely so, glabrous or scabrous to puberulent; palea about as long as the body of the lemma; anthers 1.2–2.2 mm long. Desert shrub, sagebrush, mountain brush, pinyon-juniper, and ponderosa pine communities, occasionally roadside or in other disturbed places, at 1370 to 2740 m in Emery, Garfield, Millard, and Sevier counties; Colorado, Arizona, and New Mexico; Mexico; 15 (0). Spike muhly is palatable to all classes of livestock and is an excellent soil binder recommended for revegetation of mined lands.

Munroa Torr.

Low, often stoloniferous, gynomonocious annuals; culms branching at and above the decumbent base; leaves appearing fasciated at culm nodes; sheaths open, hairy at the summit; blades narrow, mostly flat or folded; ligule a ring of hairs; inflorescence a small headlike cluster of sessile to short-pedicelled spikelets closely subtended by and partially hidden within the fasciated leaf blades; spikelets (2) 3– to 6 (10) –flowered, the lower florets pistillate or perfect, the terminal one rudimentary, the rachilla continuous or disarticulating above the glumes and between the florets; glumes narrowly lanceolate, 1–nerved, usually shorter than the lowermost lemma, sometimes one or both reduced or lacking; lemma obscurely to prominently 3–nerved, mucronate or short-awned, those of the lower spikelets leathery, those of the upper spikelets typically membranous; palea shorter and narrower than the lemma; stamens 2 or 3, well developed or rudimentary; caryopsis free of the lemma and palea, the embryo to about half the length of the grain; $x = 8$.

Anton, A. M. and A. T. Hunziker. 1978. El genero *Munroa* (Poaceae): Sinopsis morfológica y taxonómica. Bol. Acad. Nac. Ci. 52: 229–252.

Munroa squarrosa (Nutt.) Torr. False Buffalograss. [*Crypsis squarrosa* Nutt.]. Low, mat-forming annual; culms 0.1–1.5 (3) dm long, branched at the base and at the nodes above the base, prostrate to ascending or erect, sometimes rooting at the nodes, a pair of short-sheathed leaves arising at each node, these closely subtending several leafy culm branches with greatly shortened internodes, the lowermost sheaths in the clusters greatly reduced, sometimes fused, the blades awnlike; sheaths of unreduced leaves mostly less than 1 cm long, hairy at the base and sometimes along the margins, often with tufts of hairs 1–3 mm long at the summit; blades of unreduced leaves firm or occasionally soft, generally white-margined and long-tapered to an often needlelike tip, flat or folded, mostly 1–2 (3) mm wide and 1–4 cm long, essentially glabrous to strongly scabrous or scabrid-puberulent; ligule a ring of hairs 0.2–1 mm long; panicle headlike, composed of 2–4 spikelets borne in the axils of leaf clusters, much shorter than and often obscured by the leaves; spikelets sessile or short-pedicelled, subterete to somewhat compressed, 6–8 mm long, 3– to 5–flowered, all but the lowermost spikelet usually disarticulating above the glumes and between the florets, the lower 1 or 2 florets often pistillate, the uppermost rudimentary; glumes membranous, narrow, variable in size but shorter than the lowermost lemma, 1–nerved, the first sometimes lacking (reduced leaf blades often appearing to be glumes); lemmas rounded on the back, (3) 3.5–5 mm long, that of the lowermost spikelet in each panicle ultimately hardened, more or less obscurely nerved, scaberulous or otherwise roughened and with or without lateral pubescence, those of the upper spikelets often more or less membranous and conspicuously 3–nerved, truncate, minutely notched and awn-tipped, glabrous to hairy over the back, the lateral nerves pubescent below midlength with hairs to ca 1 mm long, palea shorter than the lemma; stamens 3, the anthers either rudimentary or 1–2 mm long; $2n = 16$. Salt desert shrub, desert shrub, sagebrush, and pinyon-juniper communities, usually in disturbed sites, at 1280 to 2930 m in Beaver, Carbon, Duchesne, Emery, Garfield, Iron, Kane, Millard, San

Juan, Sevier, Uintah, Washington, and Wayne counties; most of the southwestern U. S., Montana to Colorado and throughout the Great Plains, south to Texas and northern Mexico; 86 (i). Plants of this species are often infected by a woolly aphid, with the frequently abundant remains of egg cases deposited in leaf axils and over leaf surfaces as white-woolly tufts.

Oryzopsis Michx.

Tufted perennial; sheaths open; blades flat to involute; ligule membranous; inflorescence a narrow to open panicle, occasionally reduced to a raceme; spikelets terete to dorsally or laterally compressed, 1-flowered, disarticulating above the glumes; glumes green to pale and translucent, elliptical to ovate, shorter to more often longer than the body of the lemma, usually 3- to 9-nerved, rounded to short-tapered apically; lemma at maturity firm to hardened, elliptical to obovate, terete or somewhat compressed, glabrous or hairy, the callus short and blunt, the apex awned, the awn readily deciduous, straight, curved, or geniculate, sometimes basally twisted; palea similar to the lemma in texture, color, and length; stamens 3; caryopsis free of or adherent to the palea, firmly enclosed within the hardened lemma and palea, the embryo 1/6-1/3 as long as the grain; $x = 11$. *Oryzopsis miliacea* (L.) Benth. & Hook., native to the Mediterranean Region and distinguished by its broad, flat leaf blades and glabrous lemmas, has been introduced in scattered localities in the U. S., but I have seen no specimens from Utah.

1. Blades of basal leaves (1.5) 2-10 mm wide; blades of cauline leaves typically much reduced; lemmas 5-7 mm long, the callus densely short-bearded *O. asperifolia*
- Blades of basal and cauline leaves well developed but rarely more than 2 mm wide; lemmas to 5 mm long, not more conspicuously hairy on the callus than above 2
- 2(1). Lemma averaging more than 3 (3-5) mm long, the awn once geniculate; panicle branches strictly erect
 *O. exigua*
- Lemma 1.8-3 mm long, the awn straight or flexuous; panicle branches erect or ultimately spreading to deflexed. *O. micrantha*

Oryzopsis asperifolia Michx. Roughleaf Ricegrass. Perennial; culms tufted, erect to prostrate, 2-7 dm long; sheaths glabrous; blades of the basal leaves firm and erect-ascending, often exceeding the culms, (1.5) 2-10 mm wide, flat or rarely loosely involute, tapered at both ends, scabrous on the margins, dark green and smooth to scaberulous on the lower surface, glaucous and typically scabrid-puberulent above; blades of the culm leaves much reduced, mostly less than 3 cm long or lacking; ligule 0.1-0.7 mm long, truncate; panicle or raceme narrow, 3.5-8 cm long, the short branches appressed or at flowering somewhat spreading; glumes broadly elliptical to obovate, subequal, 5-8.5 mm long, 5- to 9-nerved, membranous-margined, abruptly acute at the tip, shorter than or more often at least the second equal to or slightly exceeding the lemma; lemma at maturity leathery to hardened, lanceolate, terete to somewhat flattened, 5-7 mm long and to ca 2.5 mm wide, pale green to white or yellowish, sometimes purple-tinged, glossy or dull, sparsely puberulent over the body, the short, blunt callus densely short-bearded, the awn terminal or nearly so,

5-14 mm long, usually flexuous, readily deciduous; palea similar to the lemma; anthers 2.7-3.5 mm long, with an apical tuft of hairs; $2n = 46, 48$. Moist to mesic sites under aspen, ponderosa pine, and lodgepole pine at 2250 to 2770 m in Daggett, Duchesne, Juab, and Uintah counties (Uinta and Deep Creek mts.); across Canada, south into Idaho and Montana to Colorado and New Mexico, in the Dakotas and Nebraska, and through most of the Northeast; 12 (0).

Oryzopsis exigua Thurber in Torr. Little Ricegrass. Perennial; culms tufted, slender, stiffly erect, 1-4.3 dm tall; sheaths glabrous or scaberulous; leaves chiefly basal; blades involute-filiform or occasionally flat and then to ca 2 mm wide, typically stiffly ascending and scabrous; ligule 1.5-4 mm long, acute; panicle narrow, 3-9 (11) cm long, the few-flowered, short branches appressed to the rachis; glumes membranous throughout or green near the base, occasionally purple-tinged, elliptical to obovate, subequal, 3-6 mm long, obscurely 3- to 5 (7)-nerved, smooth or scaberulous, abruptly acute to rounded at the erose or entire tip, shorter than to barely exceeding the lemma; lemma at maturity pale to brown, leathery to hardened, terete to somewhat compressed, ellipsoidal, (3) 3.5-5.5 mm long and to ca 1 mm wide, sparsely appressed-puberulent and minutely bearded above the short, blunt callus, the awn terminal or nearly so, 3-7 mm long, stout, once geniculate, usually loosely twisted below, readily deciduous; palea similar to the lemma; anthers 1.5-2 mm long; $2n = 22$. Dry, open, often rocky sites and in aspen- and lodgepole pine communities at 1820 to 2900 m in Cache, Daggett, Duchesne, Juab, San Juan, and Summit counties; British Columbia and Alberta, south in much of the western U. S. and in South Dakota; 29 (0).

Oryzopsis micrantha (Trin. & Rupr.) Thurber Littleseed Ricegrass. [*Urachne micrantha* Trin. & Rupr.]. Perennial; culms tufted, slender, erect-ascending, 3-7 (9) dm tall; sheaths glabrous to puberulent; blades flat to loosely involute, 0.5-2 (3) mm wide, more or less soft, glabrous or more often scabrous; ligule 0.2-2 mm long, usually truncate; panicle 5-20 cm long, narrow to open, the branches erect to widely spreading or deflexed, the spikelets on short, appressed pedicels; glumes thin-membranous throughout or occasionally greenish near the base, lance-elliptical, 2.7-4 (5) mm long, equal or nearly so, mostly 5- to 7-nerved, often obscurely so, abruptly acute at the tip, both glumes exceeding the lemma; lemma at maturity pale to dark brown, leathery, terete to somewhat compressed, ellipsoidal, 1.8-3 mm long and to ca 1 mm wide, glossy, glabrous or sparsely puberulent, the callus very short and blunt, glabrous or minutely hairy, the awn essentially terminal, 4-9.5 mm long, hair-like, straight or flexuous, readily deciduous; palea similar to the lemma; anthers to ca 1 mm long; $2n = 22, 24$. Dry to moist, often sandy or rocky sites in sagebrush, pinyon-juniper, mountain brush, and ponderosa pine communities, occasionally in openings in or under aspen and spruce-fir, at 1380 to 2930 m in Beaver, Carbon, Daggett, Duchesne, Emery, Garfield, Grand, Iron, Juab, Millard, San Juan, Sevier, Uintah, Washington, and Wayne counties; British Columbia to Manitoba, south in most of the states west of the Mississippi; 85 (i).

Panicum L.

Annuals or perennials; sheaths open; blades mostly flat; ligule a ring of hairs, often membranous at the base,

occasionally entirely membranous or lacking; inflorescence an open to contracted panicle or raceme; spikelets plano-convex to subterete, disarticulating below and in some species above the glumes, 2-flowered, the lower floret staminate or neuter, the upper floret perfect; glumes often markedly unequal, usually prominently several-nerved, the first commonly clasping the base of the spikelet, the second often somewhat hooded or beaked at the apex; lemma of the lower floret generally similar to the second glume in size, shape, and texture, the lemma and second glume typically sheathing the upper floret; lemma of the upper floret dorsiventrally compressed, firm or leathery, acute to rounded at the apex, at maturity often smooth and shiny or finely striate, the firm margins incurved around the edges of the equally firm palea; stamens 3; caryopsis free of but firmly enclosed within the lemma and palea, the embryo at least half the length of the grain; $x = 9, 10$. *Panicum bulbosum* H. B. K., reported from southern Utah by Cronquist et al. (1977), apparently reaches its northernmost limits in Arizona and New Mexico (Gould 1975). The manuscript for this genus was reviewed by Gerrit Davidse.

- 1. Glumes pubescent (at 10 x magnification) 2
- Glumes glabrous or scabrous, not hairy 3
- 2(1). Spikelets averaging no more than 2.5 (0.8-2.7) mm long *P. acuminatum*
- Spikelets averaging more than 2.5 (2.5-4) mm long *P. oligosanthes*
- 3(1). Second glume and sterile lemma acute to acuminate at the apex, distinctly longer than the hardened upper floret 4
- Second glume and sterile lemma abruptly acute to rounded at the apex, only slightly exceeding to shorter than the hardened upper floret 8
- 4(3). Plants perennial, occupying mostly native habitats 5
- Plants annual, typically occupying disturbed habitats 6
- 5(4). Plants with stout scaly rhizomes; culms 6-30 dm tall; first glume 2-4 mm long, nearly always averaging more than 2.5 mm long *P. virgatum*
- Plants tufted, not rhizomatous; culms 2-7.5 dm tall; first glume 1.7-2.5 mm long, usually averaging less than 2.5 mm long *P. hallii*
- 6(4). Sheaths glabrous; first glume not more than 1/3 as long as the spikelets *P. dichotomiflorum*
- Sheaths pubescent, the hairs usually papilla-based; first glume mostly more than 1/3 as long as the spikelet 7
- 7(6). Spikelets 4-6 mm long *P. miliaceum*
- Spikelets 2-3.5 mm long *P. capillare*
- 8(3). First glume about equal to the spikelet; ligule membranous, without cilia *P. obtusum*
- First glume 1/3-1/2 as long as the spikelet; ligule a ring of hairs or a membrane with cilia 9
- 9(8). Plants to 6 dm tall; panicles to 13 cm long; pedicels mostly longer than the spikelets *P. oligosanthes*
- Plants 5-30 dm tall; panicles 12-25 cm long; pedicels consistently much shorter than the spikelets *P. antidotale*

Panicum acuminatum Swartz Bundle Panic. [*Dichantheium acuminatum* (Swartz) Gould & Clark; *D. lanuginosum* (Ell.) Gould; *Panicum huachucae* Ashe; *P. lanuginosum* Ell.; *P. occidentale* Scribn.; *P. tennesseense* Ashe; *P. thermale* Bolander]. Perennial; culms 1-7 (8) dm tall, tufted, erect to ascending, unbranched during initial growth, culms appearing late in the season freely branched above the base, the ultimate branchlets forming short, dense, leafy fascicles; herbage glabrous or sparsely to densely long-hairy throughout, usually at least some of the hairs papilla-based; blades flat, initially chiefly cauline, 3.5-12 mm wide and 4-10 cm long, the blades of the autumnal fascicled branchlets mostly 2-4 cm long, a basal rosette of blades shorter and broader than those of the culm usually appearing in late summer or early fall; ligule of hairs 1-5 mm long; panicle open to somewhat contracted, terminal and axillary, the latter usually developing after the terminal ones have flowered; terminal panicles 2-12 cm long, the very slender, flexuous branches ascending to spreading, the pedicels usually averaging longer than the spikelets; axillary panicles similar but rarely more than 3 cm long, usually partially included in the sheaths; spikelets plano-convex, ovate to obovate-elliptical, 0.8-2.7 mm long; florets of the terminal panicles chasmogamous, those of the axillary panicles cleistogamous; glumes pubescent with minute spreading hairs, the first 1/5-1/3 as long as the spikelet, broadly acute to somewhat rounded apically, the second glume and the pubescent sterile lemma about equal, as long as or slightly shorter than the glossy fertile lemma; $2n = 18$. Chiefly in moist sandy sites, in hanging gardens and along waterways at 1070 to 2230 m in Emery, Garfield, Grand, Kane, Salt Lake, San Juan, Uintah, Utah, and Washington counties; sporadic in Canada, throughout the U. S., and in Mexico; South America; adventive in the U.S.S.R.; 109 (0). According to Gould and Clark (1978), the species commonly known as *P. lanuginosum* is considered to be synonymous with *P. acuminatum*. As support for elevation of the subgenus *Dichantheium* to the rank of genus, Gould and Clark (1978) provide a table comparing 24 features within *Panicum* (sensu stricto) with similar features in the dicantheia. The table demonstrates that with respect to only one of these features, namely the Kranz syndrome, can the two groups be consistently separated. Most species of dicantheia develop a rosette of short broad basal leaves and a terminal inflorescence during the cool season, and small clusters of axillary cleistogamous flowers on much branched, reduced lateral shoots during the warm season. These seasonal variations, the only readily observable morphological features by which the two groups may be distinguished, are not consistently present throughout the geographic range of the dicantheia. Perhaps largely for this reason, no consensus exists among agrostologists as to the merit of recognizing two genera (Pohl, Madrono 30: 197. 1981). I have, therefore, followed Lelong (1984) in retaining the dicantheia within *Panicum*.

Panicum antidotale Retz. Blue Panicgrass. Stoloniferous perennial from an elongate, stout rootstock; herbage often glaucous; culms 5-20 (30) dm tall, erect, becoming much branched at and above the base in age; sheaths glabrous or the collar puberulent; blades elongate, flat, mostly 3-12 mm wide, glabrous or puberulent; ligule a membranous-based ring of hairs to ca 1 mm long; panicle contracted to open, mostly 12-25 cm long, the branches

many flowered, ascending to horizontally spreading, the pedicels consistently shorter than the spikelets; spikelets dorsiventrally to laterally compressed, lanceolate to ovate, 2–3 mm long; glumes glabrous, the first more or less clasping, to about half as long as the spikelet, abruptly acute, the second glume acute to obtuse, about equal to the membranous sterile lemma, both about equal to the glossy fertile one; $2n = 18$. First reported for Utah in 1985 (Higgins 16086 BRY) from a creosote bush-blackbrush community at 950 m in Washington County; native to India, becoming established in Arizona, Texas, and Mexico; 1 (0). Blue panicgrass is an excellent sand-binder, introduced into the Southwest for erosion control. It is not tolerant of cold and its value as forage is questionable.

Panicum capillare L. Witchgrass. [*P. barbipulvinatum* Nash in Rydb.; *P. capillare* var. *occidentale* Rydb.]. Annual; culms 1–13 dm tall, typically branched from the base and often sparingly so above, erect to more often decumbent-ascending; sheaths conspicuously pubescent with long, spreading, usually papilla-based hairs; blades flat or folded, 4–15 (20) mm wide, usually long-hairy to some degree, the hairs commonly papilla-based; ligule a membranous-based ring of hairs 0.5–2 (3) mm long; panicle often at least half as long as the total length of the plant and about as broad as long, emerging tardily from the upper sheaths, much branched, the branches slender and ultimately widely spreading, the spikelets solitary at the tips of numerous, short to elongate, hairlike pedicels, the entire panicle ultimately breaking off at maturity; spikelets plano-convex to subterete, narrowly lanceolate to elliptical, 2–3.5 mm long, green or purple; glumes smooth or scabrous, the first broadly ovate, 1/3–2/3 as long as the spikelet, acute to abruptly short-tapered, the second short- to long-tapered at the apex, usually longer than the similarly shaped sterile lemma, both distinctly longer than the glossy fertile lemma; $2n = 18$. Moist to drying, often sandy sites in salt desert shrub and desert shrub communities, in rock crevices, along waterways, roadsides, and in other waste places, less frequently in meadows and in mountain brush communities, at 850 to 1830 m in Cache, Carbon, Daggett, Davis, Emery, Garfield, Grand, Iron, Kane, Salt Lake, San Juan, Sanpete, Sevier, Uintah, Utah, Washington, and Wayne counties; across southern Canada, south throughout most of the U. S. and in Mexico; South America; naturalized in much of Eurasia; 89 (ix). *Panicum flexile* (Gattinger) Scribn., which resembles *P. capillare*, is represented in the Utah flora by a solitary collection (Cottam 206 BRY) made in 1925 at about 1370 m in Utah County. This species differs from *P. capillare* in having a narrower, oblong, relatively few-flowered panicle, typically with a single, long-pedicelled spikelet terminating each branch and branchlet. *Panicum flexile* has not been reported since the initial collection and is otherwise known only from the eastern half of the U. S.

Panicum dichotomiflorum Michx. Spreading or Fall Panicum. Annual; culms 1–20 dm long, branched from the base and often sparingly so above, erect to decumbent-ascending; sheaths glabrous; blades flat, 3–20 mm wide, glabrous or scaberulous to sparsely long-hairy on the upper surface; ligule a membranous-based ring of hairs to ca 2 mm long; panicle terminal and often axillary, variable in size and shape, the terminal one to 40 cm long, emerging tardily from the upper sheaths, the primary branches usually stiffly ascending, naked at the base, the

branchlets relatively short and mostly appressed to the branch axis; spikelets short-pedicelled, plano-convex to subterete, narrowly lanceolate, 2–4.3 mm long; glumes glabrous, the first broadly ovate, 0.5–1.5 mm long, 1/5–1/3 as long as the spikelet, abruptly acute to rounded at the apex, the second acute, about equal to the membranous sterile lemma, the two distinctly longer than the glossy fertile lemma; $2n = 54$. Apparently first reported from Utah in 1919 (Garrett s.n. UT), occurring chiefly in cracks in curbing and along waterways below 1520 m in Salt Lake County; native to the eastern U. S. and south-eastern Canada, sporadically introduced in the West and the Great Plains; Eurasia; 11 (vii).

Panicum hallii Vasey Hall Panicum. Tufted perennial, often glaucous; culms strictly erect, 2–6 (7.5) dm tall; sheaths glabrous or pubescent with spreading, often papilla-based hairs; blades flat, typically curling in age, 1.5–6 (7) mm wide, glabrous or long-hairy, especially near the ligule, the hairs occasionally papilla-based; ligule an inconspicuously membranous-based ring of hairs to 1.5 mm long; panicle variable in size and shape, 6–20 (25) cm long, ultimately well exerted, the primary branches relatively few and stiffly ascending, naked at the base, the branchlets appressed to the branch axis; spikelets short-pedicelled, plano-convex, lanceolate to subovate, 2.2–4.2 mm long; glumes glabrous, the first broadly ovate, 1.7–2.5 mm long, about half as long as the spikelet, the second acute to acuminate at the apex, about equal to the membranous sterile lemma; both distinctly longer than the glossy fertile lemma; $2n = 18$. Known in Utah by a single collection (Hutchings & Stahmann 20 UT) from a juniper-grass community at 1680 m in Beaver County; Colorado, Arizona, New Mexico, Oklahoma, and Texas, south to Mexico; 2 (0). *Panicum lepidulum* Hitchc. & Chase, reported from Utah by Hitchcock (1951), was originally separated from *P. hallii* as having "more evenly flowered," narrower panicles with larger spikelets, and a "greater amount of pubescence" (Hitchcock and Chase 1910). Narrow panicles are not, however, necessarily associated with larger spikelets (Gould 1951). Other small quantitative distinctions in vegetative features noted by Hitchcock (1951) are bridged by Gould's (1975) description of *P. hallii* as it occurs in Texas. Cronquist et al. (1977) noted the weak nature of the distinction between the taxa and did not include *P. lepidulum* as part of the Intermountain Flora.

Panicum miliaceum L. Broomcorn Panicum; Hog Millet. Annual; culms 2–10 (12) dm tall, erect or decumbent-ascending, simple or branching from the base or above; sheaths loose, pubescent with long, usually papilla-based hairs; blades flat, 6–15 (20) mm wide, variously hairy to subglabrous, the margins often undulate; ligule an obscurely membranous-based ring of hairs 1–3 mm long; panicle more or less compact, mostly narrowly oblong, 5–30 cm long, emerging tardily from the upper sheaths, the branches erect-appressed and usually drooping near the tips, the spikelets short-pedicelled and crowded along the branches; spikelets plano-convex, broadly ovate, 4–6 mm long; glumes glabrous, the first 2.5–4.7 mm long, 1/2–3/4 as long as the spikelet, acute or acuminate apically, the second glume and sterile membranous lemma about equal, acute or acuminate apically, typically distinctly longer than the glossy fertile lemma; $2n = 18$, 36, 40, 42, 49, 54, 72. Escaping from cultivation and occurring as a weed of gardens and waste places mostly below

1830 m in Cache, Salt Lake, Sanpete, Utah, and Washington counties; native to China and central Asia, cultivated in temperate regions of the world since prehistoric times either as a cereal or for fodder, escaped from cultivation in North America and reported from parts of Canada and throughout the western and northeastern U. S.; South America; Eurasia; 12 (iii). Broomcorn panicum is currently used in the U. S. as feed grain, in birdseed mixtures, and as a food crop for game birds.

Panicum obtusum H.B.K. Vine Mesquite. Perennial from a base with stolons to ca 2 m long, these with crowded, swollen, densely hairy nodes; herbage glaucous; culms mostly 2–6 (8) dm tall, erect or decumbent-based, simple or branched above the base; sheaths glabrous or coarsely hairy; blades firm, elongate, 2–7 mm wide, flat to involute, often scabrous, usually with a few long hairs near the ligule; ligule membranous, not ciliate, 0.5–2 mm long; panicle narrow, to 15 cm long, the branches 2–6, spike-like and secund, racemously arranged along the main axis, mostly 1–5 cm long, erect to slightly spreading; spikelets sessile to short-pedicelled, dorsiventrally to somewhat laterally compressed or subterete, narrowly oblong to obovate, 2.8–4 mm long and 1.5–2.3 mm wide; glumes subequal, 2.2–4.1 mm long, 5- to 7-nerved, acute to rounded apically, glabrous, the second glume and sterile membranous lemma about equal, the two about as long as or barely exceeding the glossy fertile lemma; $2n = 20, 36, 40$. First reported from Utah in 1941 (Harrison 10391 BRY), generally in sandy sites along waterways, on open hillsides, and along sandstone ledges from 1010 to 1830 m in Garfield, Grand, Kane, San Juan, Washington, and Wayne counties; Arizona east to Missouri, Arkansas, and Texas, and to southern Mexico; 20 (0).

Panicum oligosanthos Schultes Scribner Panicum. [*Dicanthelium oligosanthos* (Schultes) Gould; *P. scribnerianum* Nash]. Perennial; culms 1.5–8.5 dm tall, loosely to densely tufted, unbranched during initial culm growth, the autumnal culms freely branched above the base, the ultimate branchlets forming short, dense, leafy fascicles; sheaths glabrous or more often conspicuously pubescent with papilla-based hairs; blades flat, glabrous to short-hairy or (outside Utah) tomentose, initially chiefly cauline, 3–15 mm wide and 4–14 cm long, the blades of the autumnal fasciated branchlets to ca 7 cm long, a small basal rosette of blades usually appearing in late summer or early fall; ligule of hairs 0.5–4.2 mm long; panicles open, terminal and axillary, the latter developing after the terminal ones have flowered; terminal panicles typically pyramidal, 3.5–9 cm long, the flexuous branches ascending to spreading, the pedicels shorter to much longer than the spikelets, the axillary panicles smaller than the terminal ones and usually partially included in the sheaths; spikelets plano-convex, ovate to obovate-elliptical, 2.8–4 mm long; glumes glabrous or pubescent, the first to about half as long as the spikelet, acute to obtuse or occasionally toothed apically, the second glume usually slightly shorter than the sterile lemma and the glossy fertile one; $2n = 18$. Moist sandy soil or rock crevices in hanging garden and ponderosa pine communities at 850 to 2130 m in Garfield and Washington counties; southern Canada, south through most of the U. S. and in Mexico; 3 (0). According to Gould and Clark (1978), the only phase of the species west of Colorado is var. *scribnerianum* (Nash) Fern. The variety differs from the typical

element of the species in having a ligule less than 1.6 mm long and the abaxial leaf surface glabrous to long-hairy, not tomentose.

Panicum virgatum L. Switchgrass. Perennial with stout, scaly rhizomes; herbage green or more often glaucous; culms 6–20 (30) dm tall, erect, simple or occasionally branched above the base; sheaths glabrous throughout or ciliate along the upper margin; blades elongate, flat, 3–15 mm wide, glabrous or scabrous to occasionally long-hairy; ligule a membranous-based ring of hairs (1) 1.5–5 mm long; panicle open, mostly 10–50 cm long, the mostly few-flowered branches often elongate, ascending to more or less widely spreading, the spikelets borne on slender pedicels and scattered along or clustered near the tips of primary or slender secondary branches; spikelets dorsiventrally to somewhat laterally compressed, more or less ovate, mostly 3–5 mm long; glumes glabrous, the first clasping, broadly ovate, 2–4 mm long, 2/3–3/4 as long as the spikelet, sharply acute to acuminate at the tip, the second glume 3.5–5 mm long, with an erect to spreading, acuminate tip that often slightly exceeds the similarly shaped, membranous, sterile lemma, the glume and sterile lemma distinctly longer than the glossy fertile lemma; $2n = 18, 21, 25, 30, 32, 36, 54–65, 70, 72, 90, 108$. Chiefly in moist, sandy, or rocky places along waterways and in hanging gardens, rarely in meadows, pinyon-juniper communities, or on dry hillsides, below 1830 m in Emery, Garfield, Grand, Kane, San Juan, Utah, and Wayne counties; southern Canada from Saskatchewan to Nova Scotia, south through much of the U. S., and in Mexico; introduced in Asia; 34 (i). Switchgrass is an important grass of the central and southern Great Plains, valuable as forage and pasture and for erosion control. It has been introduced in central Asia for fodder and as an ornamental.

Paspalum L.

Annuals or perennials; culms usually tufted or branched from the base; sheaths open; blades flat or folded, often broad; ligule membranous or a ring of short hairs; inflorescence a panicle of 1–many, spike-like, secund branches, these scattered along the axis or paired at the apex of the culm, the spikelets subsessile or short-pedicelled, solitary or paired, in 1 or 2 rows from one side of a flattened to 3-angled, often winged axis; spikelets orbicular to oblong, flattened to plano-convex, disarticulating below the glumes, 2-flowered, the lower floret staminate or neuter, the upper one perfect; first glume very short or lacking (the spikelet then appearing to have 2 glumes and 1 perfect floret); second glume and the sterile lemma of the lower floret membranous, usually equal or nearly so, closely sheathing the fertile floret; lemma of the perfect floret dorsiventrally compressed, leathery, glossy, minutely striate; palea leathery like the lemma, partially enclosed by the incurved, firm lemma margins; stamens 3; caryopsis free of but firmly enclosed within the lemma and palea, the embryo at least half the length of the grain; $x = 10$.

Paspalum distichum L. Knotgrass. [*P. distichum* var. *indutum* Shinners]. Stoloniferous perennial; culms 2–10 dm tall, erect to decumbent-ascending, the nodes glabrous or pubescent; sheaths essentially glabrous or more often ciliate on the margins and otherwise pubescent to some degree with long, spreading, mostly papilla-based hairs; blades flat or folded, 1.5–6 (7) mm

wide, scabrous on the margins and often sparsely pubescent with papilla-based hairs; ligule membranous, 1–2.5 mm long; panicle of paired or closely spaced, spike-like branches 1.5–7 cm long, occasionally with 1 or 2 branches below the terminal pair, the axis of the branch flat and narrow with 2 rows of solitary or paired, subsessile to short-pedicelled spikelets arising from one side, one row on either side of the midrib; spikelets elliptical to narrowly ovate, plano-convex, 2.5–4 mm long, 1.2–2 mm wide, pale or rarely purple-tinged; first glume lacking or present in variable form on some of the spikelets; second glume thin, broadly elliptical, about equal to the spikelet or nearly so, rounded on the back, 3- or obscurely 5-nerved, acute, minutely crisp-hairy; sterile lemma slightly firmer than the second glume and essentially flat, barely exceeding the fertile lemma, 3 (5)-nerved, acute, glabrous or puberulent; fertile lemma leathery, dorsiventrally compressed, pale, glossy, finely striate; anthers 1.3–1.8 mm long; $2n = 20, 30, 40, 48, 60$. Saline meadows, along waterways, and in desert shrub communities below 1520 m in Utah and Washington counties; most of the western U. S., throughout the South, and into Mexico; South America; southern Eurasia; 22 (0). The status of the name *P. distichum* has recently been the subject of much debate, the consensus appearing to lie with the view expressed by Fosberg (Taxon 26: 201–202. 1977) that the Linnaean type of *P. distichum* is the plant generally known as *P. vaginatum* Swartz. A proposal to reject the name *P. distichum* L. was, however, declined with the recommendation that the traditional use of the name be retained (Taxon 32: 281. 1983). Allred (Great Basin Naturalist 42: 103–104. 1982) finds no basis for bestowing taxonomic recognition upon the pubescent forms of *P. distichum* referred by Shinners to var. *indutum*.

Phalaris L.

Annuals or perennials; sheaths open, often with short auricles; blades flat; ligules membranous; inflorescence an ovoid to narrowly elongate, usually compact, sometimes spikelike panicle; spikelets usually 3-flowered, the terminal floret perfect, the lower 1 or 2 sterile, generally greatly reduced, occasionally lacking, the rachilla disarticulating above the glumes, the florets falling together as a unit; glumes laterally compressed, equal or subequal, longer than the terminal floret, sometimes winged on the keel; lemmas of the lower florets lacking or rudimentary and usually pubescent, the lemma of the perfect floret leathery, often glossy, laterally compressed; palea membranous, shorter and narrower than the lemma; stamens 3; caryopsis free of but at maturity usually firmly enclosed by the lemma and palea, the embryo 1/4–1/2 as long as the grain; $x = (6) 7$.

Anderson, D. E. 1961. Taxonomy and distribution of the genus *Phalaris*. Iowa State J. Sci. 36: 1–96.

1. Plants annual; spikelets obovate; glumes broadly winged *P. canariensis*
- Plants perennial and rhizomatous; spikelets lanceolate to elliptical; glumes wingless or rarely slightly winged on the keel *P. arundinacea*

Phalaris arundinacea L. Reed Canarygrass; Ribbon-grass. Rhizomatous perennial; culms erect, 5–20 dm tall; sheaths without auricles; blades flat, 6–25 mm wide,

scabrous throughout to essentially smooth except near the long-tapered tips; ligule 2–10 mm long; panicle narrowly elongate, sometimes more or less lobed near the base or throughout, more or less open at flowering, (5) 7–30 (40) cm long, the branches strictly erect or at flowering divergent to widely spreading; spikelets lanceolate to elliptical, pale green or sometimes tinged with pinkish purple; glumes subequal, narrowly lanceolate, (3.5) 4–7.5 mm long, strongly keeled, rarely slightly winged on the keel, long-tapered to sharply acute tips, more or less prominently 3-nerved, glabrous or scaberulous, exceeding the solitary perfect floret; sterile lower lemmas 2, reduced to linear, hairy scales 1–2.3 mm long, these closely subtending the perfect floret (often appearing to be pubescence on the fertile lemma); lemma of the perfect floret leathery and glossy, lanceolate, 2.7–4.5 mm long, pale green to yellowish, at maturity straw colored to dark gray brown, glabrous or sparsely appressed-pubescent, ultimately enclosing the similar but smaller palea; anthers 2.5–3.5 mm long; $2n = 14, 27–42, 56$. Along waterways and in wet meadows chiefly at 1290 to 2745 m in Box Elder, Cache, Carbon, Daggett, Davis, Duchesne, Emery, Morgan, Rich, Salt Lake, Sanpete, Sevier, Summit, Uintah, Utah, Wasatch, Wayne, and Weber counties; circumboreal, south through the U. S. (except in the South) and in northern Mexico; South America; Eurasia; 78 (viii). The ribbon grass of gardens is *f. variegata* (Parnell) Druce [var. *picta* L.], differing from the typical element of the species in having white-striped leaves. The cultivar rarely escapes but was found growing along a stream in Park City, Utah. Reed canarygrass provides good forage prior to maturity and is useful in controlling erosion in wet areas. Large populations of the grass can, however, greatly reduce the carrying capacity of irrigation and drainage ditches (Thornburg 1982).

Phalaris canariensis L. Canary Grass. Annual; culms 2–6 (10) dm tall; sheath of uppermost culm leaf inflated, sometimes bearing minute auricles; blades flat, 3–10 mm wide; ligule 3–8 mm long; panicle ovate to oblong, 1.5–4 cm long, to 2 cm wide, compact; spikelets short-pedicelled, obovate, closely overlapping; glumes subequal, 5–10 mm long, abruptly acute, pale with dark green lateral stripes, broadly winged on the keel, glabrous or sparsely appressed-pubescent; sterile lower lemmas 2, linear to narrowly lanceolate, green or chaffy, 2.5–5 mm long, sparsely hairy, one appressed to each side of the perfect floret; lemma of the perfect floret firm and glossy, lanceolate, 4–6.8 mm long, appressed-hairy; $2n = 12$. Moist to mesic, disturbed sites below 1850 m, reported from Salt Lake and San Juan counties; native to northwest Africa and the Canary Islands, a casual weed throughout most of the U. S. and in parts of Mexico; South America; Eurasia; 4 (ii). Canary grass is widely cultivated as a component of birdseed.

Phleum L.

Annuals or perennials; culms solitary or tufted; sheaths open, with or without minute rounded auricles; blades usually flat; ligule membranous; inflorescence a dense, spikelike panicle, the branches very short, often fused with the rachis all along their length (the spikelets then appearing sessile); spikelets 1-flowered, disarticulating above the glumes and at maturity below; glumes laterally compressed, keeled, equal or nearly so, longer than the lemma, gradually tapered to an acute tip or (ours)

obliquely truncate and mucronate to short-awned, mostly 3-nerved, usually ciliate on the prominent keel; lemma laterally compressed, ovate, mostly 3- to 7-nerved; palea equal to the lemma or nearly so; stamens 3; caryopsis free within the lemma and palea, the embryo to about half the length of the grain; $x = 7$.

1. Sheath of uppermost leaf typically inflated; panicles to 4(5) cm long; awns usually averaging more than 1.5 (1.5-4) mm long, culms 1-5(6) dm tall, not bulblike at the base *P. alpinum*
- Sheath of uppermost leaf not regularly inflated; panicles often more than 4 (2-30) cm long; awns usually averaging no more than 1.5 (0.6-2) mm long; culms 2-15 dm tall, typically bulblike at the base *P. pratense*

***Phleum alpinum* L.** Alpine Timothy. Perennial; culms solitary or in small loose tufts, 1-5 (6) dm tall, erect to decumbent, not bulblike at the base; sheaths glabrous, with or without small rounded auricles, sheath of the uppermost culm leaf inflated; blades flat, 2-7 (8) mm wide, subglabrous to scabrous; ligule 0.5-4.5 mm long; panicle ovoid to cylindrical, mostly 1.5-5 cm long and to about 12 mm wide when pressed, often purple; spikelets 1-flowered, oblong, 3.5-8 mm long including awns; glumes equal or nearly so, broadly membranous-margined, the apex obliquely truncate with the midnerve prolonged as an awn 1.5-4 mm long, the body of the glume generally 2-4 mm long, the keel ciliate with mostly spreading hairs to ca 1 mm long; lemma membranous, to ca 2/3 as long as the glumes, truncate-erose at the apex; anthers 1-2 mm long; $2n = 14, 28$. Chiefly streamside, in mesic to wet meadows, and in openings in aspen-spruce-fir and lodgepole pine communities, occasionally in grass-sagebrush and sagebrush-aspen ecotones, and on exposed rocky ridges at high elevations, mostly from 2135 to 3660 m in Beaver, Box Elder, Cache, Carbon, Daggett, Duchesne, Emery, Garfield, Grand, Iron, Juab, Piute, Rich, Salt Lake, San Juan, Sanpete, Sevier, Summit, Tooele, Uintah, and Utah counties; Alaska to Alberta, south throughout the western U. S. and into Mexico, east to northern Michigan and the mountains of New England; South America; Eurasia; 192 (v).

***Phleum pratense* L.** Timothy. Perennial; culms loosely to densely tufted, 2-15 dm tall, erect, typically with 1 or 2 (3) bulblike nodes at the base; sheaths glabrous, with or without small rounded auricles, none regularly inflated; blades flat, 3-8 (10) mm wide, at least the margins scabrous; ligule 1-6 mm long; panicle cylindrical, (2) 3-20 (30) cm long and 5-8 (12) mm wide when pressed, occasionally purple-tinged; spikelets 1-flowered, oblong, 2-5.2 mm long including awns; glumes equal or nearly so, broadly membranous-margined, the apex obliquely truncate with the midnerve prolonged as an awn 0.6-2 mm long, the body of the glume generally 2-3.2 mm long, the keel ciliate with mostly spreading hairs to about 1 mm long; lemma membranous, 2/3-3/4 as long as the glumes, truncate-erose at the apex; anthers 1.2-2.3 mm long; $2n = 14, 21, 28-84$. Roadsides and along waterways, in dry to wet meadows, in aspen-spruce-fir, and occasionally in oak-sagebrush, pinyon-juniper, mountain brush, and ponderosa pine communities, at 1310 to 3200 m in all Utah counties except Wayne; native to Eurasia, now circumboreal, south throughout the U. S.; South America; 134 (iv). Timothy, introduced to America from Europe prior to 1747 (Valentine 1961) because of its

palatability as a hay and pasture grass, is now naturalized in most of the temperate regions of the world. It is both cold and shade tolerant, but is vulnerable to drought, high temperatures, and close grazing.

Phragmites Adanson

Tall, coarse perennials with rhizomes or stolons; sheaths open; blades broad, usually flat; ligule membranous or a ring of hairs, the latter sometimes membranous-based; inflorescence a large, dense to somewhat lax panicle; spikelets subterete to laterally compressed, (1) 3- to 10-flowered, the rachilla densely long-hairy, disarticulating above the glumes and between the florets; florets successively smaller upward, the lowermost 1 or 2 staminate or neuter, the uppermost 1 or 2 rudimentary, the remainder pistillate or perfect, occasionally all spikelets abortive; glumes unequal, the first 1- to 3-nerved, the second 3 (5)-nerved, shorter than the lowermost floret; lemma 3-nerved; palea to about half as long as the lemma; stamens 1-3, the number variable within the spikelet; caryopsis free of and only loosely enclosed by the lemma and palea, the embryo 1/2-2/3 as long as the grain, the grain rarely reaching maturity; $x = 12$.

Clayton, W. D. 1968. The correct name for the common reed. *Taxon* 17: 168-169.

***Phragmites australis* (Cav.) Trin. ex Steudel** Common Reed. [*Arundo australis* Cav.; *P. communis* Trin.]. Rhizomatous and often stoloniferous perennial; culms mostly 2-4 m tall, to 2 cm or more in diameter, usually unbranched; blades flat, to 5 dm long and mostly 1-5 cm wide, strongly scabrous on the margins, otherwise glabrous, long-tapered at the apex, readily breaking off at the base in age due to an abscission layer in the vicinity of the ligule; ligule membranous, minutely ciliate, 0.5-3 mm long; panicle plumelike, oblong to obovoid, mostly 1.5-5 dm long and to about 2 dm wide, densely flowered, initially gray purple, becoming whitish as spikelets mature; spikelets narrowly lanceolate, 10-16 mm long, (1) 2- to 10-flowered, (occasionally entire panicles with all florets abortive), the rachilla with spreading silky hairs 6-11 mm long; glumes thin, elliptical to lanceolate, unequal, the first 3-7 mm long, the second 5.5-10 mm long, shorter than the lowermost floret; lemma thin, linear-lanceolate, the lowermost (8) 9-15 mm long, those above progressively smaller, the uppermost seldom exceeding the lowermost; $2n = 36, 44, 46, 48, 49-52, 54, 72, 84, 96$. Along waterways and in saline or freshwater marshes at 760 to 1980 m, known from all Utah counties except Beaver, Iron, Morgan, Piute, Summit, and Wasatch; circumboreal, south throughout the U. S. but less frequent in the southeast and in Mexico; South America; Eurasia; 83 (ii). *Arundo donax*, which rarely escapes from cultivation in Utah and is similar in general aspect to *P. australis*, can readily be distinguished from the latter by its hairy lemmas and glabrous rachilla. The common reed, the most widely distributed of all angiosperms (Good, Geography of Flowering Plants. 1974), is currently being used for erosion control of shore lines (Thornburg 1982).

Poa L.

Annuals or perennials, tufted or rhizomatous, occasionally stoloniferous, some species dioecious or gynomonoeious, one typically viviparous; culms usually erect;

sheaths persistent or shredding, open throughout or closed nearly to the summit; blades flat or folded to involute, mostly prow-shaped at the tips, in some species obscurely so; ligule membranous, glabrous or the abaxial surface scabrous to pubescent; inflorescence an open to compact, erect to nodding panicle; spikelets laterally compressed to less often terete or nearly so, 2- to 12 (15)-flowered, disarticulating above the glumes and between the florets; glumes subequal to unequal, lanceolate to ovate or elliptical, keeled to rounded on the back, the first glume 1- to 3-nerved, the second 3- to 5-nerved, equal to or in a few species slightly exceeding the lowermost lemma; lemma ovate to narrowly lanceolate, keeled to rounded on the back, with 3-5 (7) obscure to conspicuous nerves converging toward the rounded to acute but awnless apex; callus in some species with a tuft of mostly crumpled, cobweblike hairs, these usually longer than any on the body of the lemma; palea glabrous or scabrous to variously pubescent; palea shorter than the lemma; stamens 3; caryopsis free of or somewhat adherent to the lemma and palea, ellipsoidal, often somewhat compressed ventrally, the embryo 1/6-1/3 as long as the grain; $x = 7$. The frequency of apomixis in species of *Poa* has been viewed as contributing to problems in classification within what is considered a "difficult" genus. Of the species growing in our area, apomixis is known to occur in: *Poa arctica* (Engelbert 1940), *P. alpina*, *P. bulbosa*, *P. compressa*, *P. glauca*, *P. nervosa*, *P. palustris*, *P. pratensis* (Nygren 1954), *P. secunda* (Nygren 1951) and possibly also in *P. fendleriana* (Hitchcock et al. 1969). Although Kellogg (1985) found no correlation between morphological complexity and apomixis in the large and variable *P. secunda* complex, a number of apomictic species are pseudogamous, producing unfertilized seed only after pollination (Nygren 1954, Engelbert 1940, Kellogg 1985). As suggested by Nygren, this need for pollination may lead to hybridization among related species in natural populations. Knobloch (1963), in fact, cited 82 known interspecific hybrids for the genus *Poa*, by far the largest number encountered in all but one of the 64 genera reported upon by him. Evidence of hybridization in our material exists in the field as well as in numerous herbarium specimens, especially among plants growing at high elevations. Intergradation, if it does exist on a large scale, would clearly help to explain the complexity within the genus. Hybrids usually retain sufficient characters of one parent to be classified as such, but vary in one or two characters by which the taxon is generally recognizable. Awareness of this potential for variation should be useful to anyone attempting to identify species of *Poa*. Soreng (1985) reports *Poa stanantha* Trin. as rare in northern Utah, but I have seen no evidence that populations with the characters generally attributed to this little understood taxon actually occur south of Idaho. This treatment of *Poa* was reviewed by Elizabeth Kellogg.

1. Culms bulbous at the base; florets proliferated into bulblets with leafy shoots, occasionally some, rarely all the florets floriferous *P. bulbosa*
- Culms not bulbous-based; florets not producing bulblets 2
- 2(1). Lemmas averaging no more than 3 (1.8-3.1) mm long, typically firm throughout and green (rarely purple-tinged) below a distinct terminal band of bronze or purple (rarely the tip pale), obscurely nerved, the lateral margins soon curving around the palea; panicle branches erect to spreading, not deflexed 3
- Lemmas averaging more than 3 mm long or not otherwise as above 4
- 3(2). Panicles 10-35 cm long, at maturity often more than 3 cm wide, the branches naked below; ligule (1.8) 2-6 mm long; plants 1.5-13 dm tall, rarely appearing short-rhizomatous *P. palustris*
- Panicles often less than 10 (2-14) cm long, rarely more than 3 cm wide, many or all of the branches spikelet-bearing to the base or nearly so; ligule 0.5-2 mm long; plants 1-6 (7) dm tall, strongly rhizomatous *P. compressa*
- 4(2). Lemmas with a tuft of crumpled hairs arising from the callus, i.e., webbed at the base 5
- Lemmas not webbed at the base 13
- 5(4). Plants annual; lemmas either glabrous except for the web or densely pubescent to near the apex; plants from below 2450 m 6
- Plants perennial, not otherwise as above 7
- 6(5). Lemmas densely pubescent to near the apex on keel and marginal nerve and usually to some degree between; panicle branches to 6 cm long, at maturity erect to slightly divergent *P. bigelovii*
- Lemmas glabrous or scaberulous; panicle branches few and remote, linear, to 11 cm long, ultimately stiffly spreading to reflexed *P. bolanderi*
- 7(6). Panicle spike-like, 1-5 cm long and 1 cm wide; second glume averaging more than 3.5 (3.5-5) mm long; glumes and lemmas strongly keeled; plants mostly less than 1.5 dm tall and occurring above 3050 m *P. pattersonii*
- Panicle not spike-like, sometimes small and narrow but then not otherwise as above 8
- 8(7). Body of the lemma glabrous or sparsely pubescent only on the prominent keel, typically conspicuously 5-nerved; first glume often crescent-shaped; ligules 3-10 mm long; plants mostly more than 3 (3-10) dm tall and occurring below 2440 m *P. trivialis*
- Body of the lemma hairy on keel and marginal nerves or, if glabrous, the plants not otherwise as above 9
- 9(8). Glumes mostly incurved at the sharply acute tips and generally scabrous (at 10x magnification) on the upper keel, the second glume usually angled on the margin; lemmas to 3.5 (4) mm long, typically conspicuously 5-nerved, copiously webbed, the hairs (when extended) longer than the lemma; plants strongly rhizomatous, common from low to high elevations *P. pratensis*

- Glumes not both incurved at the tips and conspicuously scabrous on the keel; lemmas often more than 4 mm long or only sparsely webbed; plants either tufted or rarely occurring below 2440 m 10
- 10(9). Anthers averaging less than 1 (0.2–1) mm long; panicle axis usually nodding, at maturity the branches widely spreading to deflexed 11
- Anthers averaging at least 1 (1–2.5) mm long; panicle axis erect, the branches erect to spreading, in *P. arctica* occasionally deflexed 12
- 11(10). First glume typically long-tapered to a nearly awnlike tip; lemmas 3–5 mm long, glabrous between keel and marginal nerves; palea generally ciliate on the keels with minute stiff hairs *P. leptocoma*
- First glume typically abruptly acute or tapered but not at all awnlike at the tip; lemmas averaging no more than 3.5 (2–3.5) mm long, at least some of them sparsely hairy between keel and marginal nerves; palea ciliate on the keels with crinkled hairs, sometimes obscurely so *P. reflexa*
- 12(10). Lemmas often rounded on the back, averaging more than 3.5 (3.4–6) mm long, typically densely pubescent (often to above midlength) on midnerve and marginal nerves and conspicuously so between; ligules 1–4 mm long; plants with short to well-developed rhizomes *P. arctica*
- Lemmas mostly keeled, averaging no more than 3.5 (2–4) mm long, densely to sparsely pubescent on keel and marginal nerves, glabrous or sparsely hairy between; ligules 0.5–2 (2.5) mm long; plants densely tufted, occasionally rooting at subsurface nodes *P. glauca*
- 13(4). Florets pistillate, the anthers rudimentary 14
- Florets perfect or staminate, the anthers sometimes small or sterile but not colorless 16
- 14(13). Panicle internodes elongate, the lowermost averaging at least 3 (1.5–13) cm long, at flowering most of the branches horizontally spreading to deflexed; sheaths glabrous or scaberulous; plants usually bearing both perfect and pistillate florets *P. curta*
- Panicle internodes variable, the lowermost averaging less than 3 (1–4) cm long, the branches erect to spreading or occasionally the lower ones drooping; sheaths glabrous or hairy; plants usually bearing only pistillate florets 15
- 15(14). Panicles at flowering typically open; sheaths (at least some of them) retrorsely puberulent, sometimes obscurely so, the sheath bases from previous years often turning purple or dark brown and ultimately shredding in age, not usually a conspicuous feature; plants generally rhizomatous *P. nervosa*
- Panicles typically narrowly oblong and more or less compact; sheaths glabrous or scabrous, occasionally scabrid-puberulent, the sheath bases from previous years typically straw colored or gray and papery (not disintegrating into fibers), often a conspicuous feature; plants densely tufted, rarely with a few short rhizomes per tuft *P. fendleriana*
- 16(13). Spikelets broadly rounded at the base and averaging at least 2 mm wide at midlength (florets nondivergent) 17
- Spikelets narrowly rounded to wedge-shaped at the base, usually averaging less than 2 mm wide (florets nondivergent) 18
- 17(16). Panicles often pyramidal, 2–6 (9) cm long; second glume to 3 (3.5) mm long, usually incurved at the tip and scabrous on the upper portion of the keel; basal leaf blades to 8 (10) cm long and at least some of them 2 mm or more wide; plants above 2440 m *P. alpina*
- Panicles mostly narrowly oblong, 2–15 cm long; second glume 3–5.3 mm long, not usually incurved at the tip, glabrous or obscurely scaberulous on the keel; basal leaf blades often more than 10 cm long and less than 2 mm wide; plants of low to high elevations *P. fendleriana*
- 18(16). Second glumes typically angled on the margin; lemma generally pubescent on all 5 nerves (rarely entirely glabrous); panicles usually short-pyramidal, the branches smooth or nearly so; plants annual or occasionally perennial and mat-forming *P. annua*
- Second glume not angled on the margin or the plants not otherwise as above in every particular 19
- 19(18). Anthers averaging less than 1 (0.3–1) mm long; panicles to 5 cm long and sublinear to oblong or spike-like; low plants occurring at or above 3050 m 20
- Anthers averaging at least 1 (1–4) mm long, panicles often more than 5 cm long; plants otherwise diverse 21
- 20(19). Lemmas glabrous (rarely pubescent), 2–3.5 mm long, glumes mostly rounded on the back and appearing somewhat inflated *P. lettermanii*
- Lemmas pubescent to some degree, (3) 3.5–5 mm long; glumes strongly compressed and sharply keeled *P. pattersonii*
- 21(19). Sheaths (at least some) retrorsely puberulent; panicles open; plants usually rhizomatous *P. nervosa*
- Sheaths glabrous or scabrous, rarely scabrid-puberulent and then panicles compact and plants densely tufted 22
- 22(21). Lemmas hairy (often to above midlength) on keel and marginal nerves and typically conspicuously so between, averaging more than 3.5 (3.4–6) mm long, panicles loose, the branches naked below and smooth or nearly so; plants rhizomatous, restricted to high elevations *P. arctica*
- Lemma not hairy as above or, if so, either the lemmas averaging less than 3.5 mm long or the plants densely tufted, otherwise diverse 23
- 23(22). Lowermost internode of the panicle averaging at least 3 (1.5–13) cm long, most of the branches horizontally spreading or deflexed by flowering *P. curta*
- Lowermost internode of the panicle averaging less than 3 cm long, those of individual plants rarely to 4 cm long and then most of the branches erect to spreading, rarely the lowermost drooping 24
- 24(23). Lemmas averaging no more than 3.5 (2–4) mm long; ligules 0.5–2.5 mm long; anthers 1–2 mm long *P. glauca*
- Lemmas averaging more than 3.5 (3–7) mm long; ligules 0.5–12 mm long; anthers 1.2–4 mm long 25
- 25(24). Spikelets subterete or occasionally compressed, and then the upper florets very narrow and often terete or nearly so; panicles nearly always narrowly elongate and loose; lemmas glabrous or more often pubescent with minute hairs more or less evenly distributed over the lower portion *P. secunda*
- Spikelets compressed with all florets more or less strongly keeled; panicles open to compact; lemmas glabrous or pubescent with hairs restricted to (or most pronounced on) the keel and marginal nerves 26
- 26(25). Panicles open, the branches spreading, mostly naked below; glumes and lemmas typically narrowly membranous-margined; sheath bases from previous years typically brown and disintegrating into fibers, not usually a conspicuous feature; plants generally rhizomatous *P. nervosa*

— Panicles mostly oblong and densely flowered, the short branches erect to ascending, mostly spikelet-bearing to the base; glumes and lemmas typically broadly membranous-margined; sheath bases from previous years papery (not fibrillose), straw colored or gray, usually a conspicuous feature; plants densely tufted, rarely with a few short rhizomes per tuft . . .
 *P. fendleriana*

Poa alpina L. Alpine Bluegrass. Perennial; culms tufted, erect or more or less flexuous, 0.4–4 (6) dm tall, each arising from a short, thickened caudex, the latter coalesced beneath the surface of the ground; leaves chiefly basal; sheaths open to the base or nearly so, glabrous or occasionally the innermost membranous sheaths minutely hairy; blades (1) 2–4.5 (5) mm wide and to 8 (10) cm long, flat or folded, gradually to abruptly tapered to a prow-shaped tip; ligule 1–4 (5) mm long, truncate to obtuse, glabrous abaxially; panicle oblong to more often pyramidal, compact to open, 2–6 (9) cm long, the branches mostly 1 or 2 per node, 0.5–3 (4) cm long, naked below, smooth or some of them scaberulous, ascending to widely spreading or sometimes reflexed; spikelets strongly compressed, broadly lanceolate to ovate, (3) 4–6 (7) mm long, rounded to subcordate at the base, mostly 2–3 mm wide (florets nondivergent), generally purple-tinged to some degree, 3– to 6 (9) -flowered, the florets perfect or occasionally viviparous; glumes typically ovate, 1.5–3 (3.5) mm long, sharply keeled, acute at the mostly incurved tips, the keel scabrous, at least above, the second glume rounded or angled on the margins, shorter than to nearly as long as the lowermost lemma; lemma 3–5 mm long, usually sharply keeled, abruptly acute to rounded at the broadly membranous, mostly incurved tip, generally obscurely nerved, sparsely to densely pubescent on the keel and marginal nerves and usually sparsely hairy between, not webbed at the base; palea minutely stiff-ciliate on the upper portion of the keels, typically with longer hairs at or below midlength; anthers (1) 1.2–2 mm long; $2n = 14, 21-74$. Meadows, along streams and lake margins, in spruce-fir and lodgepole pine communities, and on exposed rocky slopes above timberline, at 2440 to 3960 m in Daggett, Duchesne, Salt Lake, Sanpete, Summit, Uintah, and Utah counties; circumboreal, south in North America to Oregon, Idaho, Wyoming, Colorado, and Michigan; Eurasia; 67(vii). *Poa alpina* is known to form hybrids with *P. pratensis* (Akerberg 1942, Clausen 1961).

Poa annua L. Annual Bluegrass; Winter Bluegrass. Annual or short-lived perennial, rooting at subsurface nodes and often forming dense mats; herbage bright green; culms erect or decumbent, terete or compressed, 0.2–3 (4) dm tall; sheaths often compressed, open 1/2–3/4 the length, glabrous; blades 0.8–3 (4) mm wide, flat or folded, acute to distinctly prow-shaped at the tips, occasionally scaberulous on the margins, otherwise glabrous, often transversely wrinkled, those of the uppermost culm leaves 0.5–8 cm long; ligule 0.7–4 (5) mm long, truncate to rounded, glabrous abaxially; panicle typically pyramidal, (1) 2–6 (8) cm long, the branches 1 or 2 at each node, to ca 3 (5) cm long, naked below, smooth or nearly so, ultimately widely spreading to deflexed, the lowermost internode of the rachis rarely as much as 2 cm long; spikelets compressed, ovate to lance-elliptical, 2.5–7 (10) mm long, rarely purple-tinged, (2) 3– to 6 (10) -flowered, the florets perfect; glumes moderately to sharply keeled,

the keels glabrous, the first glume narrowly lanceolate, 1.3–2.5 (3) mm long, the second mostly diamond-shaped and angled on the margin, 2–3 (4) mm long, shorter than the lowermost lemma; lemma 2–3 (4) mm long, pale membranous at the acute or more often obtuse or rounded tip, 5-nerved, sometimes obscurely so, sparsely to densely appressed-hairy on all the nerves and glabrous between or rarely completely glabrous, not webbed at the base; palea typically ciliate on the keels with minute soft hairs; anthers 0.3–1.2 mm long; $2n = 24-26, 28, 52$. An invader of lawns and moist, often waste places, occasionally in salt desert shrub, sagebrush, oak-maple, aspen-fir, lodgepole pine, and meadow communities, at 1220 to 2960 m in Beaver, Box Elder, Cache, Daggett, Davis, Duchesne, Emery, Juab, Millard, Piute, Salt Lake, Tooele, Uintah, Utah, Wasatch, and Washington counties; native to Eurasia and western North America, now cosmopolitan (Clausen 1961); 67 (v). In our area this plant is an undesirable invader of lawns, turning yellow except under cool, moist conditions.

Poa arctica R. Br. Arctic Bluegrass. [*Poa grayana* Vasey]. Perennial with short to well-developed rhizomes; culms solitary or loosely tufted, erect or decumbent-based, 0.7–4 (6) dm tall; sheaths open to midlength or below, glabrous or occasionally scaberulous; blades 0.5–3 (4) mm wide, folded or flat, generally distinctly prow-shaped at the abruptly acute tips, the blades of the uppermost culm leaves 1–5 (7) cm long; ligule 1–3 (4) mm long, abruptly acute to rounded or truncate, glabrous or abaxially scaberulous; panicle oblong to loosely pyramidal, (2) 4–8 cm long, the branches 1–4 per node, mostly 1–5 cm long, naked below, smooth or obscurely scaberulous, ascending to widely spreading or occasionally deflexed; spikelets subterete to moderately compressed, elliptical, 4–7 (8) mm long, pale green streaked with purple or purple throughout, 2– to 5 (6) -flowered, the florets perfect; glumes lanceolate, equal or nearly so, (2.5) 3–5 (6) mm long, weakly to moderately keeled, abruptly acute or more often long-tapered to sharply acute tips, glabrous or nearly so on the keels, shorter than to as long as the lowermost lemma; lemma (3.4) 4–6 mm long, keeled to more or less rounded on the back, acute to obtuse at the broadly membranous apex, distinctly to obscurely 5-nerved, typically densely pubescent (often to above midlength) on the keel and marginal nerves and usually densely so between, rarely pubescent on all the nerves and glabrous between, webbed or not webbed at the base; palea minutely to profusely crisp-hairy on the keels and between; anthers 1.2–2.5 mm long; $2n = 36-106$. Open slopes, streamside, in aspen-spruce-fir, lodgepole pine, and meadow communities at 2560 to 3960 m in Beaver, Duchesne, Garfield, Grand, Iron, Juab, Kane, San Juan, Sanpete, Sevier, Summit, and Wasatch counties; circumboreal, south in the mountains of Oregon, Nevada, and New Mexico; Eurasia; 52 (0). Finding that variation within *P. arctica* does not appear to be correlated with either geography or habitat, Welsh (1974) treats the species as a single polymorphic entity. Atypically robust plants from Iron County (Harrison 9853 UT) with panicles more than 6 cm long and lemmas less pubescent than usual, appear to be hybrids with *P. secunda*. Such plants are also known from Colorado (San Juan Mts.) and New Mexico (Wheeler Peak) where both *P. arctica* and *P. secunda* are known to occur. Otherwise, our plants are well within the range of *P. arctica* as it occurs in Eurasia.

Poa bigelovii Vasey & Scribn. in Vasey Bigelow Bluegrass. Annual; herbage yellow green, occasionally purpletinged, glabrous; culms solitary or in small tufts, erect or occasionally geniculate at the lowermost node, 1–7 dm tall; leaves chiefly cauline; sheaths open half their length or more, glabrous or nearly so; blades lax, 1–6 mm wide, mostly flat or folded, long-tapered to slender, mostly obscurely prow-shaped tips, the blades of the uppermost culm leaves to ca 8 cm long; ligule 1–6 mm long, acute, glabrous abaxially; panicle sublinear to narrowly oblong, 4–20 cm long, the branches mostly 2 or 3 at the lower nodes, to ca 6 cm long, smooth, strictly erect or slightly divergent at flowering; spikelets strongly compressed, elliptical to lance-ovate, 4–6 (7) mm long, 3– to 6 (7)-flowered, the florets perfect; glumes equal or nearly so, 2–4 mm long, sharply keeled, the tips acute and often incurved, smooth or scaberulous on the upper portion of the keel, the second glume rounded to somewhat angled on the margins, shorter than or equal to the lowermost lemma; lemma 2.7–4.5 (5) mm long, sharply keeled, incurved at the typically acute, membranous-margined apex, usually obscurely nerved, densely pubescent to near the apex on keel and marginal nerves and usually to some degree between, webbed at the base; palea pubescent on the keels and between with minute soft hairs; anthers 0.4–1 mm long; $2n = 28, 29$. Desert shrub, juniper, and creosote bush communities, in moist washes and on open, sandy or rocky slopes below 1520 m in Kane, San Juan, and Washington counties; southern California east to Colorado, New Mexico, Oklahoma, and Texas, south into Mexico; 21 (0).

Poa bolanderi Vasey Bolander Bluegrass. Annual; culms solitary or in small tufts, erect, 2–5 (8) dm tall; leaves chiefly cauline; sheaths terete or compressed, open 1/3–1/2 the length, glabrous; blades lax, 2–4 (5) mm wide, usually flat, abruptly or gradually tapered to a prow-shaped tip, essentially glabrous, the blades of the uppermost culm leaves to ca 10 cm long; ligule 1.5–4 (5) mm long, rounded to long-tapered, glabrous abaxially; panicle ultimately open, 4–20 cm long, the branches few, remote, linear, initially erect, ultimately stiffly spreading to reflexed, smooth or scaberulous, the lowermost 2–11 cm long; spikelets compressed, elliptical, 3.5–6 (7) mm long, 2- or 3-flowered, the florets perfect; glumes keeled, the first 1.5–2.8 mm long, the second 2–3.5 mm long, mostly shorter than the lowermost lemma; lemma 1.5–4.5 mm long, keeled, not regularly incurved at the acute to obtuse, membranous tip, obscurely to more or less distinctly nerved, webbed at the base, otherwise glabrous; palea glabrous throughout or scaberulous on the keels; anthers 0.5–1.5 mm long; $2n = 28$. Dry to moist, open or wooded habitats from ca 1525 to 2620 m in Cache and Garfield (Eggleston 8219 US, originally determined as *P. occidentalis* Vasey) counties; Washington to southern California, east to Idaho and Nevada; 1 (0).

Poa bulbosa L. Bulbous Bluegrass. Short-lived perennial, in our climate nearly always viviparous to some degree; herbage green or glaucous; culms solitary to densely tufted, 1–5 (7) dm tall, erect or geniculate at one or two of the lower nodes, arising from more or less pear-shaped bulbs to ca 1 cm long; sheaths open from just below midlength nearly to the base, glabrous or occasionally minutely hairy; blades 0.5–3 (4.5) mm wide, flat to loosely involute, obscurely to distinctly prow-shaped at the tips, the blades of the uppermost culm leaves 2–10 cm

long; ligule (1) 1.5–5 (8) mm long, obtuse to long-tapered, abaxially glabrous; panicle narrowly oblong to ovoid, (1.5) 2–13 cm long, erect or nodding, compact or more or less open at flowering, the branches 1–5 per node, usually scaberulous, mostly 0.5–3 cm long; spikelets typically borne in more or less dense clusters at tips of short branches, the 3–6 (8) florets mostly proliferating into a single, ultimately purple-based bulblet, the lowermost 1 or 2 lemmas typically empty, the succeeding one basally thickened and elongating, closely abutting the remaining lemmas, these modified to form the bulblet, the apical portions of the upper lemmas assuming the typical leaf characters of sheath, ligule, and blade, the latter often reaching 3 cm or more in length while still attached to the plant; floriferous spikelets strongly compressed, elliptical or lanceolate to ovate, (2.5) 3–7 mm long, 3- to 7-flowered; glumes equal or nearly so, (1.5) 2–4 mm long, sharply keeled, incurved at the acute tips, the keels scabrous on at least the upper portion, the second glume distinctly shorter than the lowermost lemma; lemma (2) 3–5 (6) mm long, strongly keeled, typically incurved at the acute membranous tip, obscurely 5-nerved, pubescent on keel and marginal nerves or only on the keel, occasionally the body completely glabrous (often variable within a single panicle), webbed or not at the base; palea keels glabrous or scabrous to ciliate with minute, stiff hairs; anthers 1–2.5 mm long; $2n = 14, 21, 28, 39–58$. Moderately dry to moist sites, as a weed of cultivated and waste areas, in sagebrush, oak-maple, pinyon-juniper, mixed conifer, meadow, and streamside communities at 1200 to 3000 m in Box Elder, Cache, Daggett, Davis, Duchesne, Juab, Millard, Morgan, Salt Lake, San Juan, Tooele, Uintah, Utah, Washington, and Weber counties; native to Eurasia and North Africa, now circumboreal, south in the U. S. to California, east to Montana, Wyoming, and Colorado, infrequent to absent elsewhere in the U. S.; 115 (xi). *Poa bulbosa* is the only member of the Gramineae arising from true bulbs (Halperin 1933). Bulbous bluegrass produces palatable forage soon after spring snow melt, but total production is low and the growing period short (Valentine 1961). The species has been used to some extent for pasture and for erosion control in parts of the West, having been adapted for use as an understory grass in range seedings of wheatgrass and other dryland grasses at elevations of less than 1200 m (Hanson 1972).

Poa compressa L. Canada Bluegrass. Perennial, rhizomatous and sometimes stoloniferous; herbage often glaucous; culms solitary to loosely tufted, erect or decumbent-based, often geniculate at one or two of the lower nodes, 1–6 (7) dm tall, usually strongly compressed, at least in the upper portion; leaves chiefly cauline; sheaths typically compressed and keeled, open nearly or quite to the base, glabrous or scabrid-puberulent; blades 1–4 (5) mm wide, flat or folded, at least those of the innovations distinctly prow-shaped at the tips, the blades of the uppermost culm leaves rarely more than 10 cm long; ligule 0.5–2 mm long, truncate to rounded, glabrous or abaxially scaberulous; panicle at maturity erect, sublinear to narrowly oblong, 2–10 (14) cm long, compact to open but rarely if ever more than 3 cm wide, the branches 1–4 (5) per node, smooth or scaberulous, erect-ascending or at flowering moderately spreading, rarely as much as 4 (7) cm long, mostly spikelet-bearing to the base or nearly so; spikelets moderately compressed, elliptical or lanceolate

to ovate, 3–6 (8) mm long, (2) 3– to 8 (10)–flowered, the florets perfect; glumes subequal, elliptical to lanceolate, 1.8–3.1 mm long, moderately to strongly keeled, abruptly acute at the tips, the second shorter than the lowermost lemma; lemma firmer than the glumes, 1.8–3.1 mm long, keeled but not strongly compressed (boat-shaped), narrowly membranous-margined, the lateral margins soon curving around the palea, rounded to abruptly acute at the entire, bronze- or purple-tipped (rarely pale) apex, obscurely nerved, pubescent below midlength on keel and marginal nerves and glabrous between to glabrous over the entire body, copiously to sparsely or not at all webbed at the base; palea subglabrous or roughened to scabrid-puberulent on the keels; anthers 0.8–2 mm long; $2n = 14, 35, 39, 42, 45-50, 56, 84$. Mesic to wet sites in pastures, along waterways, and in open places in sagebrush, juniper, oak-maple, aspen, ponderosa pine, and lodgepole pine communities, often in the wake of disturbance, at 1300 to 2600 m in Cache, Carbon, Duchesne, Juab, Iron, Rich, Salt Lake, San Juan, Summit, Tooele, Uintah, Utah, Wasatch, Washington, and Weber counties; native to Eurasia, now cosmopolitan (Clausen 1961); 46 (viii). In the more humid areas of the U. S., Canada bluegrass is employed as a pasture grass and for erosion control. It adapts well to poor soils but does not withstand heavy grazing (Hanson 1972).

Poa curta Rydb. Wasatch Bluegrass. Perennial, usually rhizomatous, typically gynomonococious; herbage dark green to glaucous; culms solitary or in small loose tufts, erect or decumbent-based, 1.5–8 dm tall, terete or frequently compressed to some degree; sheaths terete or compressed, occasionally keeled, open from about half to nearly the entire length, glabrous or scabrous; blades 1.5–5 (7.5) mm wide, flat, glabrous or scaberulous, obscurely to distinctly prow-shaped at the tips, the blades of the uppermost culm leaves 2.5–13 cm long; ligule 0.5–4 mm long, truncate to acute, the abaxial side glabrous or scaberulous to minutely hairy; panicle pyramidal to oblong, (5) 6–22 cm long, mostly erect, ultimately open, the nodes of the rachis remote, each with (1) 2 or 3 (5) branches, the lowermost internode (1.5) 2.5–13 cm long, in any one population averaging at least 3 cm long, the branches smooth or scabrous, usually all but a few of the uppermost branches horizontally spreading or more often deflexed by flowering, the longer ones typically spikelet-bearing over the distal half, the lowermost branches (1) 3–10 (12) cm long; spikelets moderately compressed, elliptical to lanceolate, (4) 5–9 (11) mm long, green or occasionally faintly purple-tinged, (1) 2– to 4 (6)–flowered, the florets perfect or pistillate, in most populations both present within each panicle, an occasional population with plants mostly pistillate, rarely some plants mostly perfect-flowered; glumes moderately keeled, narrowly lanceolate and sharply acute at the tips to subovate or obovate with tips abruptly acute to rounded, mostly narrowly membranous-margined, the keels typically glabrous or merely roughened, the first glume 1.5–4.6 mm long, the second 2–5 (5.3) mm long, shorter than the lowermost lemma; lemma (2.8) 3–6 (6.5) mm long, narrowly to broadly membranous-margined, not regularly incurved at the sharply acute to rounded, entire to erose tip, obscurely to prominently 5–nerved, glabrous or scabrous to puberulent with short crinkly hairs, often sparsely crisp-hairy on the keel and over the center back near the base with the marginal nerves glabrous, less fre-

quently sparsely crisp-hairy over the entire lower third of the lemma (variable within a population), not webbed at the base; palea keels scaberulous (at 30x magnification); anthers of perfect florets (1.3) 2–3 (3.6) mm long, those of pistillate florets colorless and mostly less than 1 mm long. Under oak-maple, aspen, and spruce-fir, rare in meadows and on open grassy slopes at higher elevations, at 1680 to 3200 m in Cache, Carbon, Davis, Duchesne, Emery, Juab, Morgan, Salt Lake, Sanpete, Sevier, Summit, Utah, Wasatch, and Weber counties; British Columbia, Idaho, Oregon, and Wyoming; 95 (xv). The holotype of this taxon (NY) is a specimen of *P. nervosa*; the name *P. curta* is retained here on a tentative basis. See *P. nervosa* for discussion of the relationship between *P. curta* and *P. nervosa*.

Poa fendleriana (Steudel) Vasey Muttongrass. [*Eragrostis fendleriana* Steudel; *P. cusickii* Vasey; *P. epilis* Scribn.; *P. longiligula* Scribn. & Williams, type from Silver Reef, Washington County; *P. eatonii* Wats., type from Cottonwood Canyon, Salt Lake County; *P. scabriuscula* Williams, type from south of Glenwood, Sevier County]. Perennial, occasionally with a few short rhizomes, usually dioecious; herbage pale to dark green or glaucous; culms tufted, erect, 1–6 (7.5) dm tall; sheaths terete or compressed, open 1/3–3/4 the length, glabrous or scaberulous to retrorsely scabrid-puberulent, the sheath bases of previous years typically straw colored or gray, papery (not disintegrating into fibers), forming a conspicuous feature; blades 1–3 (5) mm wide, flat to involute and then often appearing filiform, distinctly to obscurely prow-shaped at the tips, scabrous to puberulent on one or both surfaces or less often glabrous throughout, the blades of the uppermost culm leaves to ca 7 cm long, often very short or lacking; ligule 0.5–12 mm long, truncate to long-tapered, glabrous or abaxially scaberulous; panicle mostly oblong, 2–10 (15) cm long, densely flowered or occasionally somewhat loose at flowering, the short branches 1–5 per node, scaberulous or smooth, erect to ascending or at flowering more or less divergent, spikelet-bearing to the base or over more than half the length; spikelets compressed, elliptical or lanceolate to ovate, 4–12 (14) mm long, 2–4 (5) mm wide (florets nondivergent) or narrower in very young plants, often tinged with purple or turning pinkish, appearing shiny because of the broad membranous margins of glumes and lemmas, (2) 3– to 8 (10)–flowered, the florets evidently all pistillate in ca 92 percent of plants seen, the remainder with at least some staminate or perfect florets; glumes ovate to narrowly lanceolate, mostly sharply keeled, abruptly to sharply acute at the tips, glabrous to merely roughened on the keel, typically broadly membranous-margined, the first (2) 3–5 mm long, the second 3–5.3 mm long, much shorter than to as long as the lowermost lemma; lemma (3) 4–6 (7) mm long, keeled, typically broadly membranous-margined, rounded to sharply acute at the tip, usually obscurely nerved, glabrous or scabrous to more often sparsely to densely pubescent on keel and marginal nerves and glabrous or rarely sparsely hairy between, not webbed at the base; palea keels scabrous or densely scabrid-puberulent to ciliate with relatively long, soft hairs; anthers of staminate or perfect florets (1.5) 2–4 mm long, those of pistillate florets colorless and less than 1 mm long; $2n = 29, 56$. Commonly in openings in sagebrush, oak, pinyon-juniper, mountain brush, ponderosa pine, and spruce-fir

communities, occasionally in desert shrub communities, in talus and meadows, fringing aspen, streamside, and on exposed alpine ridges, at 910 to 3660 m in all Utah counties; British Columbia to Manitoba, south throughout the western U. S., east to the Dakotas, Nebraska, and western Texas; 787 (xiii). *Poa fendleriana* appears to intergrade with *P. nervosa* by means of occasional staminate or perfect florets (e.g., Arnow 6075, Harrison 9472 and 13004, Cottam 9451 UT) and with *P. secunda* (e.g., Harrison 12479 and Maguire 16381 UT). Because of its ability to hybridize with other species and to occupy diverse habitats throughout a broad altitudinal range, *P. fendleriana* forms an exceptionally polymorphic complex that would appear to comprise more than one species. On the basis of variation in lemma pubescence pattern and leaf width, *P. cusickii* and *P. epilis* have traditionally been segregated from *P. fendleriana* as distinct species. The transition from densely hairy to glabrous lemmas is continuous, however, and the plants with glabrous lemmas grow side by side with those having hairy ones. Plants with glabrous lemmas appear to occur in areas where *P. nervosa* also grows, and because such plants often have other characters of *P. nervosa* (such as its dark green color, broader leaves, unreduced upper blades, less persistent, puberulent sheath bases, etc.) it seems reasonable to assume that they result from intergradation between the two species. In any case, I have been unable to detect even one character that is consistently correlated with pubescence pattern of the lemma and thus find no basis for recognizing more than one species. *Poa arida* Vasey is a grass native to the Great Plains, differing from *P. fendleriana*, at least in part, in being strongly rhizomatous and in having glaucous, thickened, stiffly erect basal leaves and lemmas pubescent between the nerves. *Poa glaucifolia* Scribn. & Williams and *P. juncifolia* Scribn. (a form with glabrous or scabrous lemmas) are both closely related to, if not synonymous with, *P. arida*. I have seen no evidence that any member of the *P. arida* complex occurs in Utah. Muttongrass provides palatable and nutritious spring forage for cattle and horses, and good to fair feed for sheep, elk, and deer (Vallentine 1961). The species is drought-resistant, adapted to a wide variety of soil types, and holds up well under moderately heavy grazing. Its use in range seeding is restricted, however, because the plant produces relatively small amounts of viable seed.

Poa glauca Vahl Greenland Bluegrass. [*P. glauca* ssp. *rupicola* (Nash) W. A. Weber; *P. glaucantha* Gaudin; *P. interior* Rydb.; *P. ncmoralis* ssp. *interior* (Rydb.) Butters & Abbe]. Perennial; herbage bright green to glaucous or anthocyanic; culms densely tufted, occasionally rooting at subsurface nodes, 0.6–5 (6) dm tall, slender, more or less wiry, erect or nearly so; sheaths open nearly to the base, glabrous or occasionally scaberulous to scabrid-puberulent; blades stiffly erect to somewhat lax, 0.5–2.5 (3) mm wide, flat to involute, tapered to slender, sometimes obscurely prow-shaped tips, the blades of the uppermost culm leaves 1–12 cm long; ligule (0.5) 1–2 (2.5) mm long, truncate to obtuse, usually abaxially scaberulous; panicle sublinear to narrowly oblong, (0.8) 1–13 (17) cm long, compact to loose, the branches (1) 2 or 3 (5) per node, usually naked below, closely scabrous throughout to smooth or nearly so, erect or ascending, occasionally widely spreading, the lower branches 0.3–9 cm long; spikelets compressed to occasionally subterete, elliptical

to ovate, (2.5) 3–6 (7) mm long, often purple-tinged or purple throughout, (1) 2– to 5 (6) -flowered, the florets perfect; glumes lanceolate to ovate, at least moderately keeled, narrowly membranous at the abruptly to sharply acute tips, these often distinctly spreading, the first glume 1.5–3 (3.5) mm long, the second 2–3.5 (4) mm long, shorter to occasionally slightly longer than the lowermost lemma; lemma 2–3.5 (4) mm long, moderately to strongly keeled or occasionally rounded on the back, narrowly to broadly membranous-margined at the acute to obtuse tip, often banded below the pale membranous tips with bronze or purple or both, usually obscurely nerved, sparsely to densely hairy on keel and marginal nerves, glabrous or variously hairy between, sparsely or not at all webbed at the base; palea glabrous or scaberulous to densely and minutely scabrid-puberulent on the keels; anthers 1–2 mm long; $2n = 28, 42, 43, 44, 56–58, 62, 70–72, 75, 78$. Variation within *P. glauca* as it occurs throughout its range is very great, and plants indistinguishable from the various forms that grow in our area, including the type of *P. interior* (NY), occur in Europe, in the U.S.S.R., and throughout Canada, where the species has long been known as *P. glauca*. I find no basis for treating *P. interior* as being distinct in North America. Some workers follow Hitchcock (1951) in recognizing more than one species within the *P. glauca* complex as it occurs in North America. Only about half the Utah plants examined can be satisfactorily segregated by means of the characters given below, and correlation among these and other features is even less consistent outside Utah. I have followed Boivin (Naturaliste Canad. 94: 527. 1967) in treating the complex as comprising a single species with two intergradient, partially sympatric varieties:

1. Panicles 0.8–7 cm long, the branches often smooth, at least in part; glumes about equal, mostly abruptly acute at the tips; lemmas (at least some) pubescent between keel and marginal nerves, not webbed at the base; plants to 2.5 (3) dm tall *P. glauca* var. *rupicola*
- Panicles (3) 4–15 cm long, the branches distinctly and uniformly scabrous throughout; first glume narrower than the second and subaristate at the apex; lemmas glabrous between keel and marginal nerves, sparsely webbed at the base; plants 2–6 dm tall *P. glauca* var. *glauca*

Var. *glauca* Chiefly on open, often rocky slopes and in openings in aspen-spruce-fir, ponderosa pine, and lodgepole pine at 2290 to 3735 m in Beaver, Carbon, Daggett, Duchesne, Emery, Garfield, Grand, Iron, Juab, Kane, Millard, Piute, Salt Lake, San Juan, Sanpete, Sevier, Summit, Uintah, Utah, Wasatch, Washington and Wayne counties; circumboreal, south in the Sierra Nevada of California, in the Rocky Mts. to Arizona and New Mexico, in the Great Plains to South Dakota, and to Minnesota and Vermont; South America; Eurasia; 317 (ix).

Var. *rupicola* (Nash) J. Boivin [*P. rupicola* Nash in Rydb.]. Among scattered conifers, in alpine meadows, and on exposed rocky ridges at 2745 to 3735 m in Daggett, Duchesne, Emery, Garfield, Grand, Juab, Piute, San Juan, Sanpete, Summit, and Uintah counties; through most of the western U. S.; 58 (0). *Poa glauca* var. *glauca* apparently forms hybrids with *P. secunda* (e.g., Welsh & Christensen 2658 and Harrison 12526 UT), *P. lettermanii* (e.g., Rydberg and Garrett 9054 NY), and *P. pattersoni* (e.g., Seiler s.n. UT). *Poa glauca* differs from the out-

wardly similar *P. palustris* in occupying mostly open sites at elevations generally above 2290 m and in having lemmas with pale, often erose, membranous tips, ligules mostly less than 2 mm long, and panicles 0.8–15 cm long, in contrast to *P. palustris*, which is nearly always streamside and often below 2290 m, and has entire, mostly bronze- or purple-tipped lemmas, ligules 2–6 mm long, and panicles 10–35 cm long.

Poa leptocoma Trin. Bog Bluegrass. Perennial; culms solitary or in small tufts, erect or weak-stemmed and more or less decumbent below, 1–7.5 (10) dm tall, often rooting at subsurface nodes; sheaths open 1/2–3/4 the length, terete or compressed, glabrous or occasionally scaberulous to retrorsely scabrid-puberulent; blades 1–4.5 mm wide, flat or occasionally folded, smooth or scaberulous, those of the basal leaves mostly distinctly prow-shaped at the tips, those of the culm leaves generally obscurely so, the uppermost blade (2) 6–14 cm long; ligule 1–4.2 mm long, truncate to obtuse, glabrous abaxially; panicle sublinear to ultimately oblong-pyramidal, 3–17 cm long, often nodding, the branches in more or less remote whorls of (1) 2 (4), essentially smooth or sparingly scaberulous, rarely scabrous throughout, erect-ascending to widely spreading or drooping to deflexed, mostly naked below midlength, the lowermost to ca 9 cm long; spikelets compressed, elliptical to lanceolate, (3) 4–7 (8) mm long, usually purple-tinged to some degree, 2– to 4 (6)–flowered, the florets perfect; glumes strongly to moderately keeled, the keel scaberulous (at 20x magnification), the first narrowly lanceolate, 2–4 mm long, usually tapered to a minutely awnlike tip, the second often considerably broader than the first, 2.5–5 mm long, abruptly acute to long-tapered at the apex, much shorter than to as long as the lowermost lemma; lemma 3–4.5 (5) mm long, typically tapered to a sharply acute, membranous, bronze or purple tip, 5-nerved, sometimes distinctly so, pubescent on the keel and marginal nerves and glabrous between, or occasionally the body entirely glabrous, webbed at the base, sometimes very sparsely so; palea keels subglabrous or more often ciliate with minute, mostly stiff, often upwardly curved hairs; anthers 0.3–0.9 (1.1) mm long; $2n = 42$. Under aspen-spruce-fir and lodgepole pine, in meadows, along streams, and on moist open slopes or wet cliffs at 2135 to 3570 m in Beaver, Cache, Carbon, Daggett, Duchesne, Emery, Garfield, Grand, Iron, Juab, Piute, Rich, Salt Lake, San Juan, Sanpete, Sevier, Summit, Tooele, Uintah, Utah, Wasatch, and Wayne counties; Alaska to Alberta, south through Washington to California and Nevada, and in nearly all the Rocky Mt. states; Siberia; 84 (iv). The chief morphological difference between the outwardly similar *P. leptocoma* and *P. reflexa* lies in the shape and size of the glumes and lemmas, the longer, more consistently flat leaves, and the minute stiff cilia of the palea keels in *P. leptocoma* versus the relatively short, mostly folded leaves, and soft, wavy cilia of the palea keels in *P. reflexa*. The taxa also appear to differ ecologically in that *P. leptocoma* is more frequently found in wet places than is *P. reflexa*. The two species are occasionally sympatric, but intermediacy was observed in only 0.05 percent of the specimens examined. Vasey (Contr. U. S. Natl. Herb. 1: 267–280. 1893), in his original description of *Poa occidentalis*, cites Utah collections made by L. F. Ward. The one such collection I have seen (Ward 284 US) proved to be a robust form of *P. leptocoma*. *Poa occidentalis*, as treated by Soreng (1985), is not reported for Utah.

Poa lettermanii Vasey Letterman Bluegrass. Perennial with numerous hairlike fibrous roots; herbage glabrous or nearly so; culms densely tufted, erect or lax, 1–12 (15) cm tall; sheaths open to the base or nearly so, glabrous or some of the inner sheaths scaberulous, outer sheaths at the base of the plant often disintegrating into fibers; blades 0.3–1.8 mm wide and typically less than 3 cm long, folded or rarely flat, mostly gradually tapered to slender, prow-shaped tips; ligule 1–5 mm long, truncate to long-tapered, typically glabrous abaxially; panicle sublinear to narrowly oblong or occasionally dense and spikelike, 0.6–3.5 cm long and to about 0.5 cm wide, the branches erect-appressed or slightly spreading at flowering, smooth or obscurely scaberulous, 1–3 per node, the lowermost branch to about 1.5 cm long; spikelets short-pedicelled, moderately compressed to subterete, elliptical, 2–5 mm long, usually purple to some degree, 2– to 4-flowered, the florets perfect, the uppermost about half as long as the lower and subterete; glumes typically elliptical, mostly rounded on the back and appearing somewhat inflated, abruptly or occasionally sharply acute at the narrowly to broadly membranous tips, glabrous, the first glume 2–3 mm long, the second 2–3.5 (4) mm long, about equal to or longer than the lowermost lemma, often enclosing all the florets or nearly so; lemma 2–3.5 mm long, moderately keeled to rounded on the back, abruptly acute to obtuse at the mostly broadly membranous tip, obscurely nerved, glabrous or rarely pubescent, not webbed at the base; palea subglabrous or scaberulous to scabrous on the keels, at least above midlength; anthers 0.3–0.8 mm long. Meadows and on exposed, often rocky slopes, usually in association with *Poa glauca*, *P. secunda*, or *P. pattersonii*, at or above 3050 m in Duchesne, Grand, San Juan, and Summit counties; British Columbia and Alberta, south in the mountains of Washington, Idaho, Montana, California, Nevada, and Wyoming; 8 (0). *Poa lettermanii* appears to hybridize with *P. secunda* (Humphrey 47 NY), *P. glauca* (Rydberg and Garrett 9054 NY and Seiler s.n. UT), and *P. pattersonii* (Lackschewitz 9697 UT, Henderson & Brunsfeld 4845 NY), the resulting medley of character combinations leading to understandable confusion. *Poa lettermanii* most closely resembles the circumboreal *P. abbreviata* R. Br. Both are very small plants occupying only arctic or alpine habitats and are morphologically similar in having short compact panicles, spikelets only slightly compressed, glumes almost as long as the 4-flowered spikelets, and anthers less than 1 mm long. *Poa lettermanii* is, however, distinct in having flat to folded rather than strongly involute leaf blades, longer ligules, consistently smaller spikelets, and (typically) glabrous rather than pubescent lemmas.

Poa nervosa (Hook.) Vasey Wheeler Bluegrass. [*Festuca nervosa* Hook.; *P. wheeleri* Vasey in Rothr.]. Perennial, usually rhizomatous, incompletely dioecious; herbage green or occasionally glaucous; culms loosely to densely tufted, erect or decumbent-based, (2) 3–8 (9) dm tall; sheaths terete or compressed, open 1/5–1/2 the length, sheaths retrorsely puberulent (sometimes only the upper ones) or rarely glabrous, the lowermost often purple-tinged, usually turning dark brown and shredding in age; blades 1–5 mm wide and (1) 2–10 cm long, flat or folded, mostly long-tapered to sharply acute or obscurely prow-shaped tips, glabrous or the upper surface minutely hairy; ligule 1–3 (4) mm long, truncate to acute, opaque or

occasionally translucent, densely to sparsely puberulent or rarely glabrous on the abaxial side; panicle narrowly to broadly oblong or pyramidal, 4–13 cm long, relatively compact to open, the nodes of the rachis more or less remote, each with 1–5 branches, the lowermost internode 1–3 (4) cm long, the branches scabrous or smooth, ascending to widely spreading or occasionally those near the base drooping to slightly deflexed, usually naked below, the lower branches 1–6 (7) cm long, ranging from much shorter to occasionally slightly longer than those above; spikelets compressed, elliptical to lanceolate, (4) 5–10 (11) mm long, (2) 4– to 6 (8) –flowered, the florets evidently all pistillate in approximately 90 percent of plants seen, the remainder with some anther development; glumes lanceolate, moderately to sharply keeled, the keels smooth or scabrous, the first glume (2) 2.5–4.5 mm long, the second 3–5.2 mm long, distinctly shorter than the lowermost lemma; lemma (3.7) 4–6 (6.5) mm long, keeled, acute to obtuse, and usually narrowly membranous-margined at the apex, sometimes purple-banded below the margin, obscurely to distinctly 5-nerved, glabrous or scabrous to occasionally puberulent on keel and marginal nerves and rarely between, not webbed at the base; palea scaberulous on the keels; anthers of perfect florets 2–3 mm long, those of pistillate florets rudimentary, colorless and not usually more than 1 mm long; $2n = 28, 29, 56, 61–91$. Under aspen, spruce-fir, and lodgepole pine, in openings in wooded areas, in association with krummholz and on exposed rocky slopes at higher elevations, infrequent in sagebrush, mountain brush, and meadow communities, at (1900) 2500 to 3660 m in Beaver, Box Elder, Cache, Carbon, Daggett, Davis, Duchesne, Emery, Iron, Juab, Kane, Piute, Rich, Salt Lake, Sanpete, Sevier, Summit, Tooele, Uintah, Utah, Wasatch, Washington, and Weber counties; British Columbia and Alberta, south throughout most of the western U. S.; 191 (xx). According to Soreng (1985), our material is var. *wheeleri* (Vasey) C. L. Hitchc., differing from the typical element of the species (found only west of the Cascade Mts.), in lacking long hairs on the margins of the sheath collars and in reproducing only by agamospermy. Plants with perfect or staminate florets do, however, occur sporadically in our area, enabling *P. nervosa* to form hybrids with *P. secunda* (Goodrich 2752 a and b UT), *P. fendleriana* (Harrison 9472 and 12479 UT), *P. pratensis* (e.g., Harrison 12840 and 12605, Arnow 5989, Goodrich 2624, UT), and with *P. curta* (Arnow 6110 UT). Hitchcock et al. (1969) suggest that *P. curta* might realistically be treated as a perfect-flowered race of *P. nervosa*. Over much of their range, the taxa are distinct in reproductive strategy, morphological characteristics, and flowering time. The two species generally form discrete populations but do intergrade to some degree when sympatric. Plants from eastern Oregon and Washington, however, appear to be less sharply defined than those in other areas of the West.

Poa palustris L. Fowl Bluegrass. [*P. crocata* Michx.]. Perennial; culms loosely tufted, erect or decumbent-based, rooting at the subsurface nodes and rarely giving rise to short, slender, rhizomelike structures, (1.5) 3–13 dm tall, terete to distinctly compressed, often branching at the lower nodes; leaves chiefly cauline; sheaths terete or occasionally compressed, open to the base or nearly so, glabrous or scabrous to puberulent; blades strongly ascending or lax, (0.5) 1–4 (5) mm wide, flat or folded,

glabrous or scabrous, long-tapered to slender, prow-shaped tips, blades of the uppermost culm leaves to about 20 cm long; ligule (1.8) 2–5 (6) mm long, truncate to acute, glabrous or abaxially scaberulous; panicle initially narrow, ultimately open and oblong to narrowly pyramidal, 10–35 cm long, nodding, the branches in rather distant whorls of 2–6, ascending-spreading, naked below, generally scaberulous, the lowermost 2–13 cm long; spikelets moderately compressed, elliptical, 2.5–4 (5) mm long, (1) 2– to 5 (6) –flowered, the florets perfect; glumes subequal, narrowly lanceolate, 2.2–3.2 mm long, keeled, gradually long-tapered to sharply acute, erect to spreading tips, the second generally about as long as the lowermost lemma; lemma becoming firmer than the glumes, 2–3.1 mm long, keeled but not strongly compressed (boat-shaped), narrowly membranous-margined, the lateral margins soon curving around the palea, acute, entire, and nearly always green below the bronze or purple (rarely pale) tip, obscurely nerved, pubescent below midlength on keel and marginal nerves, usually glabrous between, webbed at the base, often scantily so; palea keels subglabrous or roughened to obscurely scaberulous; anthers 0.8–1.6 mm long; $2n = 28, 30, 32, 42$. Chiefly along waterways, less often in meadows or damp woods, at 1370 to 2895 m in Beaver, Box Elder, Cache, Carbon, Daggett, Davis, Duchesne, Morgan, Piute, Rich, Salt Lake, Sanpete, Sevier, Summit, Uintah, Utah, Wasatch, and Weber counties; circumboreal (Gleason and Cronquist 1963), south throughout the western, north-central, and northeastern U. S.; introduced in South America; 77 (xii). Although *P. palustris* most closely resembles *P. compressa* in spikelet morphology, it is more frequently confused with *P. glauca* (q.v.).

Poa pattersonii Vasey Patterson Bluegrass. [*P. abbreviata* ssp. *pattersonii* (Vasey) Love, Love, & Kapoor]. Perennial; culms tufted, 0.5–1.5 (2) dm tall, robust plants typically tapered to a narrowly elongate, conspicuously sheath-clad, often decumbent base; leaves chiefly basal; sheaths terete or compressed, open to the base or nearly so, glabrous or some of the innermost basal sheaths minutely hairy, old sheath bases persistent, loose, papery, pale, ultimately disintegrating into fibers; blades 0.5–2.5 (3) mm wide and mostly less than 8 cm long, flat or folded, mostly gradually tapered to slender, obscurely prow-shaped tips; ligule (0.5) 1–4 (8) mm long, truncate to acute, glabrous or occasionally scaberulous abaxially; panicle spike-like, 1–4.5 (5) cm long and to ca 1 cm wide, the short branches typically erect-appressed, smooth or less often scaberulous, 1–3 (4) at the lowermost node, the longest mostly less than 2 cm (including spikelets); spikelets subsessile to short-pedicelled, typically strongly compressed, mostly elliptical, 3–7 (7.5) mm long, purple or purple-tinged, 2– to 4-flowered, the florets perfect, the uppermost more than half as long as the lower and compressed; glumes mostly lanceolate and sharply keeled, broadly membranous-margined, long-tapered to sharply acute tips, the first 3–4.8 mm long, the second (3.5) 4–5 mm long, shorter than to slightly exceeding the lowermost lemma; lemma (3) 3.5–5 mm long, keeled, typically broadly membranous-margined, sharply acute to occasionally obtuse at the apex, usually mottled with purple or more often purple throughout, obscurely nerved, pubescent on the keel and marginal nerves, glabrous or variously pubescent between the nerves, very rarely the body of the lemma entirely glabrous, webbed

or not webbed at the base; palea roughened to obscurely scaberulous on the upper portion of the keel; anthers 0.7–1 (1.3) mm long. Exposed rocky slopes at or above 3350 m in Beaver, Duchesne, Grand, Piute, and San Juan counties; Alaska, Alberta, and through most of the western U. S.; 9(0). *Poa pattersonii* apparently hybridizes with *P. secunda* (Humphrey 47 NY), *P. glauca* (Seiler s.n. UT), and *P. lettermanii* (q.v.). Adding to the confusion generated by hybridization, the line drawing of *Poa pattersonii* in Hitchcock et al. (1969) (also used by Cronquist et al. 1977) was evidently made from a specimen of *P. glauca* var. *rupicola*. It does not portray the dense, spike-like panicle with the sharply acute glumes and lemmas of *P. pattersonii*. *Poa pattersonii* is part of a circumboreal complex involving *P. laxa* Haenke of Europe and a number of other North American taxa. *Poa pattersonii* differs from *P. laxa* only in having slightly larger spikelets and somewhat more compact panicles and could very reasonably be treated as a subspecies of that taxon. In fact, our material so strongly resembles a collection from New Hampshire (NY) and several from Spitzbergen, Norway (NY), that it may well have a much wider distribution than it is currently thought to have. Although *P. pattersonii* has been assigned to infraspecific status under the circumboreal *P. abbreviata*, the latter is much more closely allied morphologically to *P. lettermanii* (q.v.) than to *P. pattersonii*.

Poa pratensis L. Kentucky Bluegrass. [*P. agassizeensis* J. Boivin & D. Love]. Perennial, strongly rhizomatous; culms erect, (2) 4–10 (14) dm tall, smooth; sheaths terete or compressed, sometimes keeled, open 1/3–3/4 the length, glabrous or occasionally scaberulous to puberulent; blades 1–6 (7) mm wide, flat or folded, distinctly to obscurely prow-shaped at the tips, smooth or scabrous on the margins and sometimes on the midnerve below, occasionally short-hairy on the upper surface, especially above the ligule and on the margins near the collar, blades of the uppermost culm leaves 1–12 (14) cm long; ligule (0.7) 1–2.5 (3) mm long, truncate, glabrous or abaxially scaberulous; panicle narrowly oblong and compact to pyramidal and diffuse, 2–16 (20) cm long, erect to more or less nodding, the branches (1) 2–5 (9) per node, mostly naked below, smooth or scaberulous, ascending to widely spreading or occasionally drooping, the lowermost ranging from very short to about 10 (12) cm long; spikelets strongly compressed, mostly elliptical to ovate, 3–6.5 (7) mm long, usually purple-tinged to some degree, (2) 3– to 6 (7) -flowered, the florets perfect; glumes strongly keeled, the long-tapered, sharply acute tips typically incurved, the keels mostly scabrous on at least the upper half (at 10x magnification or less), the first glume narrowly lanceolate, 1.8–3.5 mm long, the second broader than the first, 2–3.8 mm long, often angled on the margin, shorter than to as long as the lowermost lemma; lemma 2.5–3.5 (4) mm long, strongly keeled, narrowly to broadly membranous-margined and generally banded with purple or bronze just below the usually sharply acute, mostly incurved tip, typically distinctly 5-nerved, pubescent on keel and marginal nerves, glabrous or occasionally sparsely hairy between, copiously webbed at the base; palea keels glabrous or obscurely scaberulous; anthers (0.8) 1–2 mm long; $2n = 21$ –147. Mesic to moist sites, in gardens, pastures, marshes, along roadways and waterways, in greasewood, grass-sagebrush, pinyon pine, oak-maple, aspen, ponderosa pine, lodgepole pine, aspen-

spruce-fir, and meadow communities at 1280 to 3290 m in all Utah counties except Morgan; circumboreal (Kellogg 1985), south throughout the U. S. except in the Southeast, and throughout most of the remainder of the world except in desert, tropical, and subtropical regions; 266 (x). *Poa pratensis* is capable of reproducing sexually as well as apomictically by apospory (development of the gametophyte from somatic cells) although pseudogamous apomictic forms are predominant in nature (Akerberg 1942). The species is known to form natural hybrids with *P. arctica*, *P. alpina* (Akerberg 1942), and *P. secunda* (as *P. ampla*, Clausen 1961). In our area *P. pratensis* also appears to hybridize rather frequently with *P. nervosa* (q.v.) and less often with *P. reflexa* (Harrison 12406 UT) and *P. palustris* (Taye 2455 BRV). Kentucky bluegrass is said to be the most important perennial sod-forming grass cultivated in North America. It is extensively used for pasture, recreational turf, and erosion control through most of the northern U. S., southward to southern California, and in the mountains to northern Georgia (Hanson 1972). As forage it is highly palatable and nutritious for all classes of livestock and for deer and elk. Although it can withstand continued heavy grazing better than almost any other grass, it is not drought tolerant and is, therefore, satisfactory for range seeding only in mountainous regions (Valentine 1961).

Poa reflexa Vasey & Scribn. Nodding Bluegrass. Perennial; culms solitary or loosely tufted, mostly erect, 0.5–5 (6) dm tall; sheaths open from 1/3–2/3 the length, terete or compressed, glabrous; blades 1–4 (5) mm wide, folded or sometimes flat, those of the basal leaves mostly distinctly prow-shaped at the tips, those of the culm leaves sometimes obscurely so, blades of the uppermost culm leaves 1–9 cm long; ligule 1–3.5 mm long, truncate to obtuse, abaxially glabrous; panicle sublinear to ultimately broadly oblong-pyramidal, 2–15 cm long, often nodding, the nodes of the rachis more or less remote, each with 1–2 (3) branches, these essentially smooth or rarely scaberulous to some degree, initially erect-ascending but soon spreading to drooping or deflexed, generally spikelet-bearing above midlength, the lower mostly 2–8 cm long; spikelets compressed, elliptical or ovate to lanceolate, 3–5 (6) mm long, often purple-tinged or entirely purple, 2– to 4 (5) -flowered, the florets perfect; glumes lanceolate to ovate, sharply to moderately keeled, the keel scaberulous (at 20x magnification), the first glume lanceolate to elliptical, 1.5–3.2 mm long, abruptly acute to obtuse or occasionally some of them tapered to a slender tip, the second 2–3.5 mm long, mostly abruptly acute to obtuse, much shorter than to as long as the lowermost lemma; lemma (2) 2.5–3.5 mm long, sharply acute to rounded at the narrowly to broadly membranous, often purple- or bronze-tipped apex, obscurely to distinctly 5-nerved, typically short- to long-hairy on the keel and marginal nerves and often minutely so on the intermediate nerves, webbed at the base; palea keels ciliate with minute soft hairs, sometimes obscurely so; anthers 0.2–0.8 (1) mm long; $2n = 28$. Chiefly in spruce-fir communities and on open, often rocky slopes, infrequently under aspen and lodgepole pine, in meadows, and streamside, mostly from (2550) 2750 to 3660 m in Beaver, Daggett, Duchesne, Emery, Grand, Juab, Piute, Salt Lake, San Juan, Sanpete, Sevier, Summit, Tooele, Uintah, Utah, and Wasatch counties; in the Rocky Mts. from British Columbia and Alberta south to New Mexico,

also in eastern Oregon, Nevada, and Arizona; 105 (xiv). *Poa reflexa* is closely related to but morphologically and ecologically distinct from *P. leptocoma* (q.v.). *Poa reflexa* can be readily distinguished from *P. curta* by its webbed lemmas. The species occasionally serves as a host for the smut *Tilletia fusca* Ellis & Everhart.

Poa secunda Presl Sandberg Bluegrass. [*P. ampla* Merr.; *P. brachyglossa* Piper; *P. canbyi* (Scribn.) Howell; *P. confusa* Rydb.; *P. gracillima* Vasey; *P. juncifolia* authors, not Scribn.; *P. nevadensis* Vasey; *P. sandbergii* Vasey; and *P. scabrella* (Thurber) Benth.; *Atropis laevis* var. *rigida* Beal, type from Lake Point, Tooele County]. Tufted perennial, occasionally with a few short rhizomes; herbage yellow to dark green or strongly glaucous (sometimes within the same population), plants of dry habitats often anthocyanic to varying degrees; culms loosely to more often densely tufted, mostly erect, (0.5) 1–12 dm tall; sheaths open at least 3/4 the length, sometimes closed only near the base, glabrous or occasionally scaberulous, old sheath bases not consistently a conspicuous feature; blades 0.4–3.5 (4) mm wide, mostly folded or involute upon drying, tapered to a sometimes obscurely prow-shaped tip, usually scabrous to some degree, blades of the uppermost culm leaves 0.2–22 cm long; ligule 0.5–7 mm long, truncate to acute, usually scaberulous to some degree on the abaxial side; panicle sublinear to narrowly elongate or in an occasional plant pyramidal, 2–27 cm long, loose or rarely compact, the branches (1) 2–5 (8) per node, scabrous or smooth, erect-ascending or spreading, the latter chiefly during flowering, the lowermost branches from very short to ca 6 cm long, some of them spikelet-bearing to the base or nearly so; spikelets subterete or occasionally compressed (but then the upper florets very narrow and often terete or nearly so), usually narrowly elliptical, (3.5) 4–12 mm long, typically averaging at least 4 times as long as wide (florets nondivergent), often bronze- or purple-tinged, (2) 3– to 6-flowered, the florets perfect; glumes narrowly to broadly lanceolate or rarely ovate, mostly either rounded on the back or not keeled to the base, not regularly incurved at the abruptly acute or obtuse to rounded tips, the first glume 2–5 mm long, the second (2.5) 3–5 (6) mm long, distinctly shorter to slightly longer than the lowermost lemma; lemma 3–6 mm long, rounded on the back or occasionally keeled, typically narrowly membranous-margined at the acute to rounded, often bronze- or purple-banded apex, 5-nerved, usually obscurely so, commonly evenly puberulent over the lower third but varying from densely hairy over the lower 2/3 to scabrous or entirely glabrous, not webbed at the base; palea keels scabrous to scabrid-puberulent; anthers 1.2–3 (3.8) mm long; $2n = 44, 56, 61-72, 74, 78, 81-106$. Often the dominant grass, occurring on dry to mesic, neutral to strongly saline soils, in openings in greasewood-iodinebush, sagebrush, oak, pinyon-juniper, mountain brush, aspen, aspen-fir, lodgepole pine, spruce-fir, and meadow communities at 1280 to 3660 m in every Utah county; Alaska, across much of Canada to Quebec, south in the western U. S. and into Mexico, in the Great Plains states as far south as Nebraska, and in Michigan; South America: 771 (xliv). *Poa secunda* apparently hybridizes with *P. glauca*, *P. fendleriana*, *P. lettermanii*, *P. nervosa*, *P. pattersonii*, and *P. pratensis* (q.v.). Examination of numerous specimens of South American *P. secunda* revealed that plants of the southern hemisphere are morphologically and ecologi-

cally within the range of variation displayed by the group of western North American plants referred by Hitchcock et al. (1969) to the *P. sandbergii* complex (Arnow, Syst. Bot. 6: 412–421. 1981). *Poa secunda*, being the older epithet, replaces *P. sandbergii* as the correct name for the complex. Occurring as they do in an extraordinarily wide range of habitats, members of the complex exhibit an unusual number of outwardly distinct forms, many of which have been segregated as species. Kellogg (1985), in a comprehensive biosystematic review of the complex, found, as did Marsh (1952), that the only defensible taxonomic treatment for the group involves recognition of two species: *P. curtifolia*, a narrow endemic restricted to the Wenatchee Mts. in central Washington and *P. secunda*, the wide ranging species described above. Of the many forms taken by *P. secunda*, that with the open panicle referred to *P. gracillima* is one of the most distinctive. In a few plants collected from a hybrid swarm between *P. secunda* and *P. nervosa* (Goodrich 27526 UT), all characters of *P. nervosa* are suppressed except for the looseness of the panicles. Because *P. gracillima* occurs only sporadically (does not form populations) and because it occupies habitats where *P. nervosa* may also be present, one wonders whether hybridization with introgression may be the explanation for this distinctive entity wherever it occurs. Sandberg bluegrass is variable as to palatability but provides good, though relatively coarse, early spring forage in areas where it receives ample moisture. It has been successfully seeded in areas with as little as 30 cm mean annual precipitation and is useful in controlling erosion because volunteer plants fill the spaces between larger bunchgrasses (Thornburg 1982).

Poa trivialis L. Rough-stalked Bluegrass. Perennial, sometimes stoloniferous; culms tufted, often rooting at subsurface nodes and appearing short-rhizomatous, erect or decumbent-based, 3–10 dm tall, terete or compressed; sheaths terete or compressed, open at least half the length, usually glabrous; blades lax, 1–6 (8) mm wide, flat, long-tapered to slender, obscurely prow-shaped tips, typically scabrous at least on the margins, blades of the uppermost culm leaves mostly 4–15 cm long; ligule (3) 4–10 mm long, truncate to acute, abaxially glabrous; panicle narrowly oblong to pyramidal, (4) 10–23 cm long, relatively compact to open, the branches 1–6 (8) per node, mostly naked at the base, typically strongly scabrous, ascending to widely spreading, the lowermost to about 8 cm long; spikelets strongly compressed, elliptical to ovate, 2.5–5 mm long, 2- to 4-flowered, the florets perfect; glumes sharply keeled, the sharply acute tips mostly incurved, the keels scabrous, the first glume narrowly lanceolate to crescent-shaped, 1.7–3.2 mm long, the second broader than the first, 2–3.5 mm long, often angled on the margin, shorter than to nearly as long as the lowermost lemma; lemma 2–3.5 (4) mm long, generally strongly keeled, regularly incurved at the usually narrowly membranous, sharply acute tips, conspicuously 5-nerved, the body glabrous or occasionally sparsely hairy on the keel, conspicuously to sparsely webbed at the base; palea keels glabrous throughout or merely roughened; anthers 1–2 mm long; $2n = 14, 15, 28, 42$. Along waterways, in wet meadows, and in moist woods at 1280 to 2440 m in Cache, Garfield, Grand, Morgan, Salt Lake, Utah, and Weber counties; native to Eurasia, now circumboreal, sporadic in the northwestern U. S., south to New Mexico and east to South Dakota, common throughout the Northeast; South America: 12 (ii).

Polypogon Desf.

Annuals or perennials; sheaths open; culms tufted; blades flat; ligules membranous; inflorescence a dense to somewhat interrupted, spike-like panicle; spikelets laterally compressed to subterete, 1-flowered, disarticulating below a short, callus-like segment of the pedicel, the spikelet and pedicel segment usually falling together, the rachilla ultimately disarticulating above the glumes; glumes equal or the first slightly the longer, lanceolate to oblanceolate, exceeding the floret, 1-nerved, keeled to rounded on the back, acute to obtuse, entire or bifid at the awned or awnless apex; lemma hyaline and shiny, ovate, subterete, obscurely 5-nerved, the lateral nerves often prolonged as minute teeth, awnless or the awn subterminal, delicate, straight, and readily deciduous; callus short, glabrous; palea slightly shorter than the lemma; stamens 1-3; caryopsis free of or somewhat adherent to the lemma and palea, the embryo less than half the length of the grain; $x = 7$.

Bjorkman, S. O. 1960. Studies in *Agrostis* and related genera. Symb. Bot. Upsal. 17: 1-112.

1. Glumes awnless *P. semiverticillatus*
 — Glumes awned 2
 2(1). Glumes obtuse and shallowly lobed at the apex, the awn 2-10 mm long *P. monspeliensis*
 — Glumes acute and entire to minutely bifid at the apex, the awn 1-3(5) mm long *P. interruptus*

Polypogon interruptus H.B.K. Ditch Polypogon. [*P. lutosus* of American authors, not (Poir.) A. S. Hitchc.]. Tufted annual or perennial; culms 2-8 (10) dm tall, erect to decumbent, often geniculate at the lower nodes; blades lax to ascending, flat, 2-12 mm wide; ligule 3-10 mm long; panicle 2-10 (15) cm long, compact to open, the short to relatively long branches mostly erect to strongly ascending or at flowering widely spreading, spikelet-bearing to the base or nearly so; spikelets green or purple-tinged, disarticulating only above the glumes or tardily so below a callus-like segment of the pedicel; glumes nearly equal, narrowly lanceolate to elliptical, 1.5-2.8 (3) mm long, scabrous only on the keel or more often scaberulous to puberulent throughout, acute and entire to minutely bifid at the apex, with a terminal awn 1-3 (5) mm long; lemma shiny, transparent or opaque, ca 1/2-3/4 as long as the glumes, awnless or with a delicate subterminal awn 0.2-2 mm long; anthers usually sterile, to ca 0.8 mm long; $2n = 28, 42$. Disturbed moist sites in pastures and along waterways below 1520 m in Garfield, Salt Lake, San Juan, and Utah counties; British Columbia south throughout the southwestern U. S. and into Mexico, rare in the Great Plains; South America; Eurasia; 10(iii). In Eurasia this largely sterile, relatively rare plant is referred to *x Agrostis littoralis* (Smith) C. E. Hubbard in recognition of its status as a naturally occurring hybrid between *Agrostis stolonifera* and *Polypogon monspeliensis* (Tutin et al. 1980, Tsvelev 1984). In our area, two large hybrid swarms have been observed wherein the parent plants were growing in close association (Arnou 5801 and 5960 UT). The hybrid is unlike *Polypogon* in that the spikelets do not (or do not as readily) disarticulate below the glumes, and is unlike *Agrostis* in having awned glumes. Of 30 or more panicles examined, only 2 had developing caryopses in a few florets.

Polypogon monspeliensis (L.) Desf. Rabbitfoot Grass. [*Alopecurus monspeliensis* L.]. Tufted annual; culms 0.5-6 (7) dm tall, erect to ascending, often geniculate at the nodes; blades lax, flat, 0.5-13 mm wide; ligule (2) 4-10 (12) mm long; panicle more or less cylindrical, appearing softly long-hairy, mostly (0.5) 1-15 cm long, and 0.5-3 (4) cm wide when pressed, compact or somewhat lobed to interrupted, the short branches more or less spreading at flowering, spikelet-bearing to the base or nearly so; spikelets pale green or at maturity tawny, 1-flowered, readily disarticulating below a callus-like segment of the pedicel; glumes nearly equal, narrowly oblanceolate, 1.4-2.5 mm long, minutely hairy and more or less scabrous on the midnerve, shallowly lobed at the apex, a delicate, scabrous awn 2-9 (10) mm long arising between the minute, rounded lobes; lemma shiny, about half as long as the glumes, awnless or with a fragile awn to about 1.5 mm long; palea nearly as long as the lemma; anthers 0.2-0.5 mm long; $2n = 14, 28$. Mostly along waterways and in marshy, sometimes saline sites at 1220 to 2130 m in Beaver, Box Elder, Cache, Carbon, Daggett, Davis, Emery, Garfield, Grand, Juab, Kane, Millard, Salt Lake, San Juan, Sanpete, Sevier, Tooele, Uintah, Utah, Washington, Wayne, and Weber counties; native to Eurasia and Africa, now circumboreal, south throughout the western U. S., from South Dakota to Louisiana, in all the Atlantic coastal states, and in Mexico; South America; 190 (vii).

Polypogon semiverticillatus (Forsskal) Hylander Water Polypogon. [*Phalaris semiverticillata* Forsskal; *Agrostis semiverticillata* (Forsskal) C. Chr.; *A. verticillata* Vill.]. Tufted or stoloniferous perennial; culms 1.5-8 dm tall, erect to decumbent-based, often geniculate and freely rooting at the lower nodes; blades lax or ascending, flat, 1.5-8 mm wide; ligule 1-3 (7) mm long; panicle 1.5-16 cm long, compact to interrupted and lobed, the branches erect to widely spreading at flowering, spikelet-bearing to the base or nearly so; spikelets green or occasionally purple-tinged, 1-flowered, readily disarticulating below a callus-like segment of the pedicel; glumes nearly equal, elliptical, 1-2.2 mm long, scabrous on the keel and roughened to scabrid-puberulent over the back, rounded to abruptly acute at the apex, awnless; lemma shiny, about 1/2-2/3 as long as the glumes, awnless; anthers 0.2-0.5 mm long; $2n = 14, 28$. Moist places, especially along waterways from 610 to 2130 m in Garfield, Iron, Kane, Millard, Salt Lake, San Juan, Sevier, Tooele, Utah, Washington, and Wayne counties; native to Eurasia and North Africa, introduced in the U. S. from Washington to California, in Arizona, New Mexico, Oklahoma, and Texas, south to Mexico; South America; 70 (iii). Because the glumes are awnless, many North American workers include *P. semiverticillatus* in the genus *Agrostis*. The species is, however, closer to *Polypogon* than to *Agrostis* in having the spikelets disarticulating below the glumes, the lemma considerably shorter than the glumes, and the callus consistently glabrous. The transfer of this species to *Polypogon* was effected by Hylander (Uppsala Univ. Arsskr. 7: 74, 1945); the validity of his work confirmed by Bjorkman (1960); and his treatment followed by Tutin et al. (1980) and Tsvelev (1984). Tutin et al. refer the species to an earlier name, *P. viridis* (Gouan) Breistr., whereas Tsvelev retains *P. semiverticillatus*.

Puccinellia Parl.

Annuals or perennials, culms erect or geniculate to decumbent-spreading at the base, sheaths open throughout or nearly so, blades flat to involute, ligule membranous; inflorescence a narrow to open panicle; spikelets terete or subterete, (2) 3- to 9-flowered, disarticulating above the glumes and between the florets; glumes unequal to subequal, lanceolate to ovate, rounded on the back, the first 1 (3)-nerved, the second 3- to 5-nerved, shorter than the lowermost lemma; lemma obovate or ovate to oblong, rounded or rarely keeled on the back, prominently to more often obscurely (3) 5- to 7-nerved, the nerves parallel or nearly so, the membranous-margined apex obtuse to acute and often erose; palea as long as the lemma or nearly so; stamens 3; caryopsis free of but enclosed within the lemma and palea, broadly ovoid to fusiform, embryo 1/6-1/3 as long as the grain; $x = 7$. In spite of their abundance in some areas, most species of *Puccinellia* have little forage value because they cannot withstand grazing pressure.

Church, G. L. 1949. A cytotoxic study of *Glyceria* and *Puccinellia*. Amer. J. Bot. 36: 155-165.
 ———. 1952. The genus *Torreyochloa*. Rhodora 54: 197-200.
 Clausen, R. T. 1952. Suggestion for the assignment of *Torreyochloa* to *Puccinellia*. Rhodora 54: 42-45.
 Davis, J. I. 1983. Phenotypic plasticity and the selection of taxonomic characters in *Puccinellia* (Poaceae). Syst. Bot. 8: 341-353.

- 1. Annuals mostly less than 1 (0.1-1.2) dm tall; panicles sublinear, 1-8 cm long *P. simplex*
- Perennials mostly more than 1 (1-14) dm tall; panicles narrow to ultimately open, 2-30 cm long 2
- 2(1). Lemmas prominently nerved; plants strongly rhizomatous *P. pauciflora*
- Lemmas obscurely nerved; plants solitary to tufted, not rhizomatous 3
- 3(2). Panicle branches typically spikelet-bearing to the base or nearly so, mostly narrowly divergent at maturity; lemmas typically glabrous throughout, firmer than the glumes and somewhat shiny *P. fasciculata*
- Panicle branches naked below, ultimately widely spreading or deflexed; lemmas typically puberulent near the base (sometimes obscurely so), similar to the glumes in texture 4
- 4(3). Plants with yellow green herbage and mostly erect culms; panicle branches to 15 cm long, widely spreading, rarely deflexed at maturity *P. nuttalliana*
- Plants with blue green herbage and mostly geniculate to decumbent-based culms; panicle branches to about 6 (8) cm long, at least some of them deflexed at maturity *P. distans*

Puccinellia distans (L.) Parl. Weeping Alkaligrass. [*Poa distans* L.]. Perennial; herbage typically blue green; culms solitary or more often tufted, sometimes mat-forming, usually decumbent-based, often geniculate at the lower nodes, 1-7 dm tall; sheaths glabrous; blades flat, often becoming involute, 0.5-4.5 mm wide, glabrous or scaberulous; ligule 0.9-2.2 mm long; panicle open, narrowly lanceolate to broadly pyramidal, 6-20 cm long, the branches loosely spaced, 2-6 per node, to ca 6 (8) cm long, ascending to ultimately widely spreading or often deflexed, usually spikelet-bearing over the distal half, glabrous or scabrous; spikelets ovate to narrowly oblong, 3-8 mm long, 3- to 9-flowered, often purple-tinged; glumes ovate to narrowly lanceolate, acute to obtuse and

entire or erose at the membranous-margined apex, the first 0.5-1.5 mm long, the second 1-2.5 mm long; lemma similar to the glumes in texture, ovate to obovate or oblong, 1.4-3 mm long, rounded on the back, faintly nerved, the lowermost mostly truncate to obtuse at the minutely erose-ciliate, membranous-margined apex, minutely hairy near the base, sometimes obscurely so; anthers 0.3-1 mm long; $2n = 14, 28, 42$. Moist sites, chiefly in salt desert shrub communities, occasionally along roads and waterways and in pastures and meadows, or in mixed conifer communities, at 1070 to 2620 m in Box Elder, Cache, Daggett, Davis, Duchesne, Emery, Garfield, Grand, Juab, Kane, Millard, Rich, Salt Lake, San Juan, Sanpete, Sevier, Tooele, Uintah, Utah, Wasatch, Washington, Wayne, and Weber counties; native to Eurasia, adventive and becoming naturalized in North America from Alaska across Canada to Nova Scotia and southward throughout most of the western U. S., in the Great Plains as far south as Nebraska, and occasional in the Northeast; 110 (xvi). See *P. nuttalliana*.

Puccinellia fasciculata (Torr.) Bicknell Torrey Alkaligrass. [*Poa fasciculata* Torr.]. Tufted perennial; herbage usually glaucous; culms erect to somewhat decumbent at the base, 1-6 (8) dm tall; sheaths glabrous; blades flat to involute, 1-5 mm wide, scabrous; ligule 0.5-2.5 mm long; panicle narrow and contracted, 2-18 cm long, the branches strictly erect or at maturity narrowly divergent to occasionally widely spreading, to ca 7 cm long, at least the shorter branches spikelet-bearing over the distal 2/3 or more, usually scabrous or scaberulous; spikelets ovate to narrowly oblong, (2) 2.5-6 mm long, 2- to 5 (8)-flowered, rarely faintly purple-tinged; glumes ovate, acute to obtuse at the subtentire, broadly membranous-margined apex, the first 0.5-1.5 mm long, 1-nerved, the second 1-2 mm long, 3-nerved; lemma typically firmer than the glumes and somewhat shiny, ovate to oblong, 1.5-2 (2.5) mm long, rounded on the back or slightly keeled toward the tip, faintly nerved, mostly acute to obtuse at the minutely erose membranous-margined apex, typically glabrous throughout; anthers 0.5-1 mm long; $2n = 28$. Moist sites in salt desert shrub communities below 1370 m in Davis, Salt Lake, Tooele, and Utah counties; native to Europe, introduced in Nevada and Arizona and along the east coast from Nova Scotia to Virginia; 22 (ix).

Puccinellia nuttalliana (Schultes) A. S. Hitchc. Nuttall Alkaligrass. [*Poa nuttalliana* Schultes; *Puccinellia airoides* (Nutt.) Wats. & Coult.]. Perennial; herbage yellow green; culms slender, solitary or in small tufts, nearly always strictly erect, (1) 3-10 dm tall; sheaths glabrous; blades flat, often becoming involute, 0.5-4 mm wide, glabrous or scabrous; ligule 1-3.1 mm long; panicle at maturity open, pyramidal to oblong, 6-30 cm long, the branches loosely spaced, 2-6 per node, the lowermost to ca 15 cm long, ascending to ultimately widely spreading or infrequently deflexed, usually spikelet-bearing on the distal half, glabrous or scabrous; spikelets ovate to narrowly oblong, 4-8 mm long, 3- to 7-flowered, often purple-tinged; glumes ovate to narrowly lanceolate, acute to obtuse, entire or erose at the membranous-margined apex, the first 0.5-1.8 mm long, the second 1-2.5 mm long; lemma similar to the glumes in texture, ovate to obovate or oblong, 1.8-3.5 mm long, rounded on the back, faintly nerved, the lowermost mostly acute to obtuse at the minutely erose-ciliate, membranous-margined apex, minutely hairy near the base, sometimes

obscurely so; anthers 0.6–1.4 (2) mm long; $2n = 42, 56$. Moist sites, chiefly in salt desert shrub communities, in meadows and along waterways at 1280 to 2620 m in Box Elder, Cache, Daggett, Davis, Duchesne, Emery, Garfield, Grand, Rich, Salt Lake, Sanpete, Sevier, Tooele, Uintah, Utah, Wayne, and Weber counties; Alaska to Manitoba, south in the U. S. throughout the West, south in the Great Plains to Kansas, and in Minnesota and Wisconsin, rare in the East; 92 (ix). According to McNeill and Dore (Naturaliste Canad. 103: 536. 1976), the earliest legitimate epithet for this species is *Poa nuttalliana* Schultes, published in 1824 as a replacement for *Poa airoides* Nutt. (1818), the later being a homonym of the validly published *Poa airoides* Koeler (1802). Although workers usually describe the native North American *Puccinellia nuttalliana* as having glumes and lemmas larger than those of the introduced *P. distans*, plants that in the field otherwise resemble *P. distans* exhibit nearly the same range of variation in these characters as does *P. nuttalliana*. All other characters by which the two species have traditionally been separated are likewise overlapping, although the range of variation for each is distinct. The reality of two species, however, is readily observed in the field. Populations of *P. nuttalliana*, with its yellow green herbage, its erect, slender culms in loosely spaced small tufts, and its mostly ascending-spreading panicle branches, present a distinct contrast to populations of *P. distans* with its blue green herbage and ultimately purple gray panicles, its decumbent-ascending, tufted, somewhat coarser culms (often mat-forming in wet places), and its frequently deflexed panicle branches. Identification becomes a problem when these distinctions are lost in the process of converting the plants to herbarium specimens. Moreover, the two species are not infrequently sympatric and, being outcrossers (Smith, J. Agric. Res. 68: 93. 1944), may occasionally hybridize.

Puccinellia pauciflora (Presl) Munz Weak Mannagrass. [*Glyceria pauciflora* Presl; *Torreyochloa pauciflora* (Presl) Church]. Rhizomatous perennial; culms erect or decumbent-based, 2.5–14 dm tall; sheaths smooth, the lowermost often cross-veined; blades lax, flat, 3–15 mm wide, scaberulous; ligule 3–9 mm long; panicle 10–30 cm long, open, often nodding, the more or less remote branches ascending to drooping, to 8 cm long or longer, mostly spikelet-bearing over the distal half, glabrous or scaberulous; spikelets laterally compressed, ovate to narrowly oblong, 2.5–8 mm long, 3- to 7-flowered; glumes mostly subequal, lanceolate to ovate or obovate, acute to obtuse at the entire to subentire, broadly membranous-margined apex, the first 0.8–1.3 mm long, 1 (3)-nerved, the second 1.2–2 mm long, 3-nerved; lemma broadly oblong, 1.8–3 mm long, rounded on the back, prominently 5- to 7-nerved, mostly truncate at the minutely erose apex, usually purple-banded below the membranous margin, typically scaberulous, at least on the nerves; anthers 0.5–0.8 mm long; $2n = 14$. Chiefly streamside in conifer forests and in wet meadows at 2130 to 3230 m in Daggett, Duchesne, San Juan, Sevier, Summit, and Uintah counties; Alaska to southwestern Canada, south throughout the western U. S.; 16 (0). Church (1949) removed several species (including *P. pauciflora*) from *Glyceria*, placing them in a new genus, *Torreyochloa*, based primarily on differences in basic chromosome number, condition of leaf sheaths, and nervation of the second glume. Clausen (1952) pointed out that *Torreyochloa* is

aligned with *Puccinellia* in the above characters and recommended that it be included in that genus as a section, distinguished from other sections in *Puccinellia* primarily by the prominent nerves of the flowering glumes. Munz (1968), Hitchcock et al. (1969), Voss (1972), and Cronquist et al. (1977) have all followed Clausen's recommendation.

Puccinellia simplex Scribn. Annual; culms tufted or solitary, erect to stiffly ascending or prostrate, 0.1–1.2 dm tall; sheaths broad and loose, glabrous; blades mostly folded to involute, 0.5–1.5 mm wide, scaberulous; ligule 1–2.5 mm long; panicle sublinear, 1–8 cm long, stiffly erect, often remaining partially enclosed within the sheath at maturity, the short branches appressed to the rachis; spikelets narrowly oblong, 5–8 mm long, 3- to 6-flowered, green or faintly purple-tinged; glumes mostly unequal, lanceolate, acute or obtuse at the nearly entire, membranous-margined apex, the first 1–1.5 (2) mm long, 1- to 3-nerved, the second 1.5–3 (3.5) mm long, 3-nerved; lemma at maturity firmer than the glumes, lanceolate, 2.5–3.5 mm long, rounded on the back below, more or less keeled toward the tip, obscurely nerved, acute to obtuse at the entire to subentire, membranous-margined apex, minutely hairy below midlength or throughout; anthers to ca 0.5 mm long; $2n = 56$. Known in Utah from a single population in a heavily grazed greasewood community at 1310 m in Weber County (Arnow 3901, 5907 UT); California; 8 (ii). This grass was first seen in 1974 and was recollected from a population covering many acres in 1982, but not seen on subsequent visits.

Redfieldia Vasey

Perennial; sheaths open; ligule of hairs; inflorescence a panicle; spikelets 1- to 6-flowered, disarticulating above the glumes and between the florets; glumes subequal, 1-nerved; lemma 3-nerved, the callus long-hairy; stamens 3; caryopsis free of but retained within the lemma and palea, oblong, the hilum punctate, the embryo nearly half as long as the grain; $x = 10$? A monotypic genus of the west-central U. S.

Reeder, J. R. 1976. Systematic position of *Redfieldia* (Gramineae). Madrono 23: 434–438.

Redfieldia flexuosa (Thurber) Vasey Blowout Grass. [*Graphephorum flexuosum* Thurber]. Perennial with long, slender rhizomes; culms 5–12 dm tall, often branched above the base; sheaths glabrous, shredding in age; blades 2–5 mm wide, loosely involute, glabrous or scaberulous; ligule a ring of hairs to ca 1.5 mm long; panicle diffuse, oblong, open, 2–5 dm long, the branches and branchlets slender to hairlike, widely spreading, the pedicels hairlike, flexuous, mostly 1–5 cm long; spikelets lanceolate to ovate, (1) 2- to 6-flowered, (4) 5–8 mm long, gray green to brownish; glumes subequal, narrowly lanceolate, 2.5–5 mm long, shorter than the lowermost lemma; lemma somewhat firmer than the glumes, laterally compressed, lanceolate, 4–6.5 mm long, distinctly 3-nerved, the lateral nerves sometimes slightly prolonged beyond the lemma, the midnerve often prolonged as an awn-tip to ca 0.5 mm long, the callus pubescent with hairs to ca 2 mm long; palea less than 2/3 as long as the lemma; anthers 2–3 mm long; $2n = 25$ (Reeder, Amer. J. Bot. 64: 103. 1977). Sand dunes in desert shrub and pinyon-juniper communities at 1490 to 1830 m in Kane and Uintah counties; Arizona, New Mexico, Colorado,

and from North Dakota to Texas; 17 (0). Blowout grass is of value only as a sand binder.

Saccharum L.

Perennials; culms erect, to 3 (6) m tall; sheaths open to the base or nearly so; leaf blades flat or folded; ligule membranous or of hairs arising from a short membranous base; inflorescence a large, usually dense panicle, the primary branches persistent, the branchlets fragile, bearing 2 (3) spikelets, one sessile and usually falling with the rachis internode and pedicel(s) of the other spikelet(s), the remaining spikelet(s) short-pedicelled and disarticulating below the glumes; spikelets all alike, dorsally compressed to subterete, enveloped in long hairs arising from the base, 2-flowered, the lower floret reduced and neuter, the upper perfect; glumes membranous or firm, equal or nearly so, (1) 3- to 5-nerved, surpassing the florets; lemma of both florets membranous, that of the upper one awned or awnless; palea of the lower floret reduced or lacking, that of the upper floret shorter than the lemma; stamens 3; caryopsis free of the lemma and palea, ellipsoidal, the embryo about half as long as the grain; $x = 10$.

Saccharum ravennae (L.) Murray Ravenna Grass. [*Andropogon racemae* L.; *Erianthus ravennae* (L.) Beauv.]. Coarse, densely tufted perennial; culms mostly 2-4 m tall; sheaths short-hairy or smooth; blades firm, to ca 12 mm wide, strongly scabrous on the margins and usually densely long-hairy at the base; ligule membranous, 0.3-1.2 mm long, anterior to the hairs of the blade and appearing to be composed of hairs; panicle plumelike, 2.5-6 dm long, the primary branches to about 20 cm long and more or less spreading, the numerous ultimate branchlets 1-2 cm long, disarticulating at the base at maturity; spikelets lanceolate, 3.5-7 mm long excluding awns, enveloped in hairs to about 7 mm long arising chiefly from the base; glumes firmer than the lemma, equal to or exceeding the florets, whitish to tawny or purple-tinged, long-tapered to sharply acute, often awnlike tips, usually hairy on the back, as well as from the base; lemma of the perfect floret membranous, 3-5 mm long, with a terminal slender awn 3-8 mm long; anthers ca 2 mm long; $2n = 20$. An escape from cultivation and persisting; hanging gardens, along waterways, and on open slopes at 610 to 910 m in Washington County; native to Eurasia, cultivated as an ornamental and occasionally escaping in parts of the western U. S.; 8 (0). Tutin et al. (1980) have submerged *Erianthus* in *Saccharum*, the two having been separated solely according to whether or not the fertile lemma is awned or awnless.

Schedonnardus Steudel

Perennial; leaves chiefly basal; sheaths open; ligule membranous; inflorescence a panicle, the primary branches simple, spikeletlike, usually few and remotely spaced, the spikelets sessile, well spaced and appressed along 2 sides of a sometimes obscurely 3-angled rachis, at maturity the entire panicle breaking off at the base and becoming a tumbleweed; spikelets slender, 1-flowered, disarticulating above the glumes; glumes unequal, 1-nerved; lemma narrow, 3-nerved; palea subequal to the lemma; stamens 3; caryopsis free of lemma and palea, subcylindrical, the embryo about half as long as the grain; $x = 10$. A monotypic genus of the western hemisphere.

Schedonnardus paniculatus (Nutt.) Trel. Tumble-grass. [*Lepturus paniculatus* Nutt.]. Perennial, sometimes flowering the first year; herbage subglabrous to scabrous or scabrid-puberulent; culms slender, wiry, solitary or in small tufts, 0.8-5 (7) dm long, erect or decumbent-spreading; sheaths compressed and keeled, broadly membranous-margined; blades 2-12 cm long, 0.6-2 (3) mm wide, flat or folded, narrowly whitish-margined, becoming spirally twisted on drying; ligule 1-3.5 (4) mm long; panicle 1/2-3/4 the height of the plant, composed of 2 to several, linear, stilly spreading, spikeletlike branches 2-10 (20) cm long, these widely spaced along an erect to loosely S-curved main axis; spikelets sessile, about as broad as and mostly strictly appressed to the concave surface of the branches and along the terminal portion of the main axis, subterete to laterally compressed, 3-6 mm long, the glumes more or less firm, narrowly lanceolate, keeled, sharply acute to short-awned, the second glume shorter than or equal to the solitary floret; lemma firm, narrowly lanceolate, 3-5 mm long, typically appressed-hairy near the base, acute to minutely awn-tipped; anthers to ca 1.2 mm long; $2n = 20, 30$. Disturbed sites, chiefly below 1830 m in Cache, Carbon, Emery, and Uintah counties; central North America from Saskatchewan south into Mexico; South America; 14 (0).

Schismus Beauv.

Annuals but occasionally perennating; culms tufted; sheaths open; ligule a usually membranous-based ring of hairs; inflorescence a panicle; spikelets subterete to moderately flattened, 4- to 10-flowered, the uppermost more or less reduced, the rachilla disarticulating above the glumes and between the florets; glumes equal or subequal, 3- to 7-nerved, about equal to the terminal floret; lemma lance-ovate to obovate, laterally compressed but at maturity rounded on the back, 9-nerved, broadly membranous-margined, the midvein often extended as a minute bristle; palea slightly shorter than the lemma; stamens 3; caryopsis free of the lemma and palea, glossy and translucent, ellipsoidal, the embryo 3/5-2/3 the length of the grain; $x = 6$.

Conert, H. J. and A. M. Turpe. 1974. Revision der Gattung *Schismus* (Poaceae: Arundinoideae: Danthonieae). Abh. Senckenberg. Naturf. Ges. 532. 1-81.

- 1. Lemmas apically lobed (the lobes 0.5-1 mm long), hairy over the back with hairs mostly 1 mm long; glumes typically averaging more than 5 (5-7) mm long *S. arabicus*
- Lemmas subentire to emarginate at the apex (the notch less than 0.5 mm long), subglabrous to hairy chiefly on the margins or minutely hairy on the back; glumes typically averaging 5 (3.5-6) mm long or less *S. barbatus*

Schismus arabicus Nees Arabian Mediterranean Grass. This species is similar to *S. barbatus*, differing as follows: leaf blades 0.5-2 mm wide, often flat or merely folded, frequently hairy; panicles ovate to elliptical and compact, occasionally loose, 1-5 cm long; glumes 5-7 mm long, lemmas 2.2-3.5 mm long, lobed apically to the base of the membranous margin, the lobes mostly 0.5-1 mm long, pubescent over the back with hairs to ca 1 mm long; palea mostly sharply acute apically; $2n = 12$. Desert shrub and creosote bush communities and open slopes below 1370 m in Kane and Washington counties, first reported in Utah in 1941 (Harrison 10229 BRY); native to the Mediterranean Region and Asia, introduced in the

southwestern U. S.; South America; 7 (0). Although *S. arabicus* and *S. barbatus* have essentially the same distribution in Utah and are sometimes sympatric, both species are inbreeding and do not appear to be intergrading.

Schismus barbatus (L.) Thell. Mediterranean Grass. [*Festuca barbata* L.]. Annual; culms tufted, 0.5–3.5 dm tall, erect to widely spreading; sheaths glabrous or with scattered long hairs, typically with long hairs lateral to the ligule at the summit; blades mostly 0.5–1 mm wide and strongly involute, glabrous or occasionally long-hairy; ligule an obscurely membranous-based ring of hairs to ca 2 (3) mm long; panicle narrowly oblong, mostly 1–4 cm long, loose to compact; spikelets subterete to laterally compressed, 3.5–7 mm long, often purple-tinged, 5- to 7-flowered; glumes about equal, lanceolate, 3.5–5.5 (6) mm long, equal to or slightly shorter than the terminal floret, 5- to 7-nerved; lemma obovate, 1.5–2.5 mm long, rounded on the back, conspicuously 9-nerved, minutely emarginate at the broad apex, the notch occupying only the upper portion of the broad, membranous margin, typically hairy on the lateral margins and often with a few hairs near the middle of the back; palea rounded to acute at the apex; anthers 0.2–0.5 mm long; $2n = 12$. Desert shrub, pinyon-juniper, and creosote bush communities below 1370 m in Washington County; native to the Mediterranean region and Asia, introduced into the southwestern U. S.; South America; 14 (0).

Schizachne Hackel

Perennials; sheaths closed; blades flat to loosely involute; ligule membranous; inflorescence a usually narrow, often nodding, loose panicle or raceme; spikelets slender, 3- to 7-flowered, the rachilla disarticulating above the glumes and between the florets; glumes membranous, unequal, rounded on the back, the first (1) 3- to 5-nerved, the second 5-nerved; lemma firmer than the glumes, lanceolate, rounded on the back, (5) 7- to 13-nerved, glabrous or scaberulous, bearded on the callus, awned from below a bifid apex; palea shorter than the lemma, densely puberulent along the keeled nerves; stamens 3; caryopsis free of the lemma and palea, smooth and shiny, ellipsoidal, the embryo $1/5$ – $2/5$ as long as the grain; $x = 10$.

Koyama T. and S. Kawano. 1964. Critical taxa of grasses with North American and eastern Asiatic distribution. *Canad. J. Bot.* 42: 859–884.

Schizachne purpurascens (Torr.) Swallen False Medic. [*Trisetum purpurascens* Torr.]. Tufted perennial; culms erect or decumbent at the base, 3–11 dm tall; sheaths glabrous or rarely scaberulous; blades flat to loosely involute, 1–5 mm wide, glabrous or occasionally sparsely long-hairy; ligule 0.3–2 (3) mm long, initially united in front, often splitting and the outer margins forming auricelike remnants on the sheaths; panicle (raceme) (5) 6–17 cm long, with 5–20 spikelets, the slender branches ascending to drooping, each bearing 1–3 spikelets; spikelets terete or nearly so, narrowly elliptical, 1–2 cm long, 3- to 7-flowered; glumes broadly lanceolate, acute to obtuse at the apex, pale or purple-tinged below the broad membranous margin, the first 4–6.5 mm long, (1) 3 (5) -nerved, the second 6–9 mm long, 3- to 5-nerved, shorter than the lowermost lemma; lemma lanceolate, 7.5–12 mm long, rounded on the back, distinctly 7- to 9 (13) -nerved, glabrous or scaberulous, the

callus of the lowermost lemma densely bearded with hairs mostly 1–2 (3) mm long, the apex bifid, the acute teeth 1.2–2 mm long, the awn arising between the teeth, 8–15 mm long, ultimately recurved; palea distinctly shorter than the lemma, densely puberulent on the keeled nerves; anthers 1.4–2 mm long; $2n = 20$. Mesic to moist sites, in aspen, lodgepole, and ponderosa pine communities, streamside and in wet meadows, at 2030 to 2500 m in Daggett, Duchesne, and Uintah counties (Uinta Mts.); Alaska to Newfoundland, south in the U. S. from Montana to New Mexico, and from North Dakota and Nebraska to Maine and Maryland; Siberia; 13 (0).

Schizachyrium Nees

Annuals or perennials; culms sparingly to much branched above the base; sheaths open, terete or compressed and keeled; blades flat to loosely involute; ligule membranous; inflorescence of solitary spike-like racemes terminating the culm and each of its branches, often partially enclosed by the uppermost sheath; spikelets plano-convex, lanceolate, 2-flowered, arranged on the rachis in pairs, one sessile, the other short-pedicelled, the rachis disarticulating below the sessile spikelet, the spikelet pair falling as a unit together with the associated pedicel and rachis internode, the latter structures nearly flat to rounded on the abaxial side, not medially grooved; sessile spikelet with the lower floret neuter, often rudimentary, the upper floret perfect or pistillate; pedicelled spikelet much reduced or occasionally lacking; glumes firm to hardened, narrowly lanceolate, longer than the florets, the first (abaxial) obscurely several-nerved, slightly shorter to longer than the second; lemma membranous, that of the upper floret of the sessile spikelet entire or 2-lobed at the apex, awnless or with a geniculate twisted awn arising from the apex or from between the apical lobes; palea hyaline or lacking; stamens 1–3; caryopsis free of the lemma and palea, the floret remaining enclosed within the glumes, the embryo large; $x = 10$. See *Andropogon*.

Schizachyrium scoparium (Michx.) Nash in Small Little Bluestem. [*Andropogon scoparius* Michx.]. Perennial, occasionally producing short rhizomes; herbage often glaucous or purplish; culms tufted, usually erect, 7–15 dm tall, the upper half sparingly to much branched; sheaths often flattened and more or less keeled, glabrous or less often hairy; blades 1.5–5 (6) mm wide, flat or loosely involute toward the long-tapered, filiform tips, scabrous and sometimes sparsely long-hairy; ligule 1–3 mm long; racemes 2.5–5 (6) cm long, solitary at the tips of the culm and its branches, the rachis segments and the ultimately recurved pedicels ciliate with widely spreading white hairs 2–3 (4) mm long, the abaxial surface of the pedicels visible between the rows of hairs; sessile spikelet narrowly lanceolate, 5–9 mm long, short-bearded at the base, the glumes ultimately firm to hardened, dorsiventrally compressed, the first nearly flat or dorsally shallowly grooved, glabrous or scaberulous, the lemma of the upper floret with a geniculate, basally twisted awn 6–16 mm long; pedicelled spikelet typically no wider than the pedicel, 2–5 (6) mm long (excluding the awn-tip when present); anthers 3–5 mm long; $2n = 40$. Along waterways, in rock crevices, and in desert shrub, pinyon-juniper, ponderosa pine, and hanging garden communities at 1070 to 2290 m in Emery, Garfield, Grand, Kane, San Juan, Washington, and Wayne counties; British Colum-

bia to Nova Scotia, south through most of the western U. S. and in the Great Plains; 35 (0). Occasional plants with but one raceme terminating the culm and its branches (e.g., Welsh 19345 BRY) otherwise resemble *Andropogon gerardii* in having copious yellow hairs to 4 or 5 mm long within the inflorescence. See *Andropogon*.

Sclerochloa Beauv.

Annuals; stems erect to prostrate; sheaths open half the length to nearly throughout; ligule membranous; inflorescence a 1-sided, mostly spike-like panicle; spikelets 3- to 8-flowered, disarticulating below the glumes and falling entire; glumes firm, unequal; lemma leathery, membranous-margined, keeled; palea hyaline, shorter than the lemma, truncate; stamens 3; caryopsis free of the lemma and palea, narrowly triangular-ovoid, the hilum basal, punctiform; $x = 7$. A monotypic genus native to southern Europe.

Swallen, J. R. 1931. *Crassipes*, a new grass genus from Utah. Amer. J. Bot. 18: 684-685.

Sclerochloa dura (L.) Beauv. Hardgrass. [*Cynosurus durus* L.; *Crassipes annuus* Swallen, type from "between Salt Lake City and Ogden"]. Low glabrous annual; culms 0.3-1.5 (2) dm long, densely tufted, typically prostrate to ascending; sheaths more or less compressed, open nearly to the base; blades flat or occasionally folded, 1-3 mm wide, to ca 6 cm long, somewhat prow-shaped at the tips; ligule 0.5-2 mm long; panicle secund, spike-like or occasionally branched near the base, 1-4 (5) cm long and 6-12 mm wide, with strongly overlapping, sessile to short-pedicelled spikelets, often exceeded by the upper leaf blades; spikelets narrowly oblong, compressed, 6-9 (11) mm long, 3- to 5-flowered, the lower 2 or 3 fertile and the upper 1-3 staminate or sterile; glumes firm, broadly lanceolate to ovate, strongly keeled, typically obtuse apically, the first 1.5-3.5 mm long, (1) 3-nerved, the second 2.5-5 mm long, 5- to 7-nerved, shorter than the lowermost lemma; lemma leathery, linear-oblong, strongly keeled, (3) 4-6 mm long, prominently 5- to 7-nerved (the nerves parallel or nearly so), obtuse to truncate at the apex; anthers 0.8-1.5 mm long; $2n = 14$. Apparently first collected in Utah in 1928 (Fallas s.n. US), occurring in chiefly dry, disturbed sites below 1520 m in Cache, Davis, Juab, Salt Lake, Utah, and Weber counties; native to Eurasia, adventive to well established in the northwestern U. S., Colorado, and Texas; 28 (iv).

Secale L.

Annuals or perennials; sheaths open, typically with relatively well-developed auricles; blades flat or involute; ligule membranous, short; inflorescence a somewhat flattened, compact, terminal spike, the rachis continuous or disarticulating; spikelets solitary and sessile at each node of the rachis, 2(3)-flowered; glumes subulate to narrowly lanceolate, usually 1-nerved, acute to awn-tipped, shorter than the spikelet; lemma lanceolate, laterally compressed, sharply keeled, 5-nerved, long-awned; palea well developed; stamens 3; caryopsis free of the lemma and palea, subcylindrical, the embryo not more than half as long as the grain; $x = 7$. See discussion of the tribe Triticeae under *Agropyron*.

Secale cereale L. Cultivated Rye. Annual or occasionally biennial; culms solitary to tufted; culms mostly 6-18 dm tall, erect; sheaths glabrous to hairy, the auricles

(when present) to 1 mm long; blades flat, 3-10 mm wide, glabrous or scabrous to stiffly hairy; ligule to ca 2 mm long; spike 4-15 (17) cm long (excluding awns), more or less 4-angled in cross section and to ca 1 cm wide, often somewhat nodding, the rachis continuous or ultimately disarticulating, the internodes 2-5 mm long at midlength of the spike, marginally hairy; spikelets solitary at each node, disarticulating above the glumes or the spikelet falling entire with the rachis segment, the 2 lower florets well-developed and arising at nearly the same level from a broad, contracted rachilla, the rachilla sometimes prolonged and bearing a third rudimentary floret; glumes subulate to narrowly lanceolate, equal or nearly so, 5-12 (17) mm long, strongly keeled, often asymmetrically so, 1 (3)-nerved, acute to awn-tipped, shorter than the florets; lemma firm, broad, (10) 12-16 mm long, more or less asymmetrically compressed, the sides visible between the glumes, 5-nerved, ciliate along the keel and the inner upper margin with coarse bristlelike hairs to ca 1 mm long, tapered to a straight, scabrous awn 0.5-7 cm long; anthers 7-9 mm long; $2n = 14, 16, 27-29$. Cultivated, commonly escaping, often along roadsides, in fallow fields and other waste places, occasionally on open grassy slopes and in desert shrub, sagebrush, and mountain brush communities at 1280 to 2900 m in Beaver, Box Elder, Cache, Davis, Garfield, Grand, Juab, Kane, Millard, Salt Lake, Sanpete, Tooele, Utah, and Washington counties; native to Eurasia, widely cultivated throughout Canada, the U. S., and to a lesser extent in Mexico; South America; 54 (ii). *Secale cereale*, as it occurs in the Northern Hemisphere, is the rye of commerce, derived from and possibly incorporating features of several taxa native to Asia. See *Triticum* for a discussion of the artificially produced hybrid commonly known as triticale. *Secale montanum* Gussone, a tufted perennial native to Asia, has been used for range seeding programs in Davis County. It differs from *S. cereale* in being perennial and in having a readily disarticulating panicle rachis.

Setaria Beauv.

Annuals or perennials; culms sometimes branching at the lower nodes; sheaths open, often compressed and keeled; blades usually flat; ligule a ciliate membrane or a ring of hairs; inflorescence a cylindrical, spike-like panicle with numerous very short branches, each branch with 1-numerous scabrous bristles (modified sterile branchlets) subtending the closely clustered, subsessile spikelets; spikelets plano-convex to subterete, lanceolate to elliptical, 2-flowered, typically disarticulating below the glumes, the lower floret staminate or neuter, with or without a palea, the upper floret perfect; glumes membranous, subequal to unequal, the first clasping the base of the spikelet, generally less than half its length, 1- to 3-nerved, the second shorter than or equal to the upper floret, 5- to 7-nerved; lemma of the lower floret similar in shape, texture, and often in size to the second glume; lemma of the upper floret firm or hardened, dorsiventrally compressed, faintly 5-nerved, rounded at the apex, smooth or more often faintly to strongly transversely wrinkled, the firm margins incurved around the edges of the equally firm, similarly textured palea; stamens 3; caryopsis free of but remaining enclosed within the firm lemma and palea, ellipsoidal to subglobose, the embryo more than half the length of the grain; $x = 9$.

Rominger, J. M. 1962. Taxonomy of *Setaria* (Gramineae) in North America. Illinois Biol. Monogr. 29: 1-132

1. Upper lemma at maturity strongly cross-wrinkled, to about twice as long as the second glume; spikelets averaging more than 2.5 (2.5-3.8) mm long, each subtended by 4-20 greenish to yellow or orange bristles . . . *S. glauca*
- Upper lemma nearly smooth to obscurely wrinkled, about equal to or only slightly exceeding the second glume; spikelets averaging less than 2.5 (1.8-2.7) mm long, each subtended by 1-4 (5) greenish or purple bristles 2
- 2(1). Bristles antrorsely scabrous, mostly 5-11 mm long *S. viridis*
- Bristles retrorsely scabrous, typically averaging less than 5 mm long *S. verticillata*

Setaria glauca (L.) Beauv. Yellow Bristlegrass. [*Panicum glaucum* L.; *Chaetochloa lutescens* (Weigel) Stuntz; *Setaria lutescens* (Weigel) Hubb.]. Annual; culms 2-8 (13) dm tall, occasionally sparingly branched above the base, erect or geniculate at the lower nodes; sheaths glabrous; blades flat or twisted in a loose spiral, 3-10 mm wide, long-hairy above the ligule and often scaberulous; ligule an obscurely membranous-based ring of hairs 0.2-1.2 mm long; panicle cylindrical, (1) 3-15 cm long, densely flowered, the axis puberulent, each spikelet subtended by 4-20 ultimately yellow to orange, antrorsely scabrous bristles 3-6 (9) mm long, these at maturity imparting a yellowish color to the panicle; spikelets plano-convex, broadly elliptical to ovate, mostly 2.5-3.8 mm long; glumes green to whitish, subequal, the second to about half the length of the spikelet; lemmas of the reduced lower floret similar to the second glume in texture and shape, about equal to the lemma of the upper floret; lemma of the upper floret at maturity hardened and strongly transversely wrinkled; $2n = 18, 36, 72$. Mostly in dry, waste places below 1520 m in Cache, Emery, Salt Lake, Tooele, Uintah, Utah, and Washington counties; native to Eurasia, now circumboreal, south throughout the contiguous U. S., in Mexico; South America; 18 (iv). Controversy has long revolved around the application of the name *Setaria glauca*, but the most recent analyses (Taxon 25: 297-304. 1976 and Naturaliste Canad. 103: 564. 1976) establish that *Panicum lutescens* Weigel, the basionym for *S. lutescens*, is illegitimate, and that Linnaeus himself clearly indicated how he wished the name *P. glaucum*, the basionym for *S. glauca*, applied. These conclusions appear to resolve the controversy, establishing *S. glauca* as the correct name for the species. Yellow bristlegrass in relatively small amounts in hay can produce extensive ulceration in oral tissues of livestock (Kingsbury 1964).

Setaria verticillata (L.) Beauv. Bur Bristlegrass. [*Panicum verticillatum* L.; *Chaetochloa verticillata* (L.) Scribn.]. Annual; culms 3-10 (15) dm tall, occasionally branched above the base, erect or geniculate at the lower nodes; sheaths glabrous or the margins ciliate near the summit; blades flat, 5-15 mm wide, strongly scabrous on the margins, often sparsely long-hairy; ligule a ciliate membrane 0.7-2 mm long; panicles cylindrical, (2) 5-10 (15) cm long, densely to loosely flowered, often somewhat interrupted, the axis more or less retrorsely scabrid-puberulent, each spikelet subtended by a solitary, greenish, retrorsely scabrous bristle 2-5 (7) mm long; spikelets plano-convex, oblong-elliptical, 2-2.5 mm long; glumes greenish, unequal, the second subequal to the spikelet;

lemma of the reduced lower floret similar to the second glume, about equal to the lemma of the perfect floret; lemma of the upper floret at maturity hardened, glossy, minutely papillose to obscurely cross-wrinkled; $2n = 18, 36, 54$. Dry to moist waste places below 1520 m in Cache, Salt Lake, Tooele, Utah, Washington, and Weber counties; native to Eurasia and Africa, widely introduced from British Columbia to Ontario and in the U. S.; 23 (j).

Setaria viridis (L.) Beauv. Green Bristlegrass. [*Panicum viride* L.; *Chaetochloa viridis* (L.) Scribn.]. Annual; culms 1-10 dm tall, occasionally branched above the base, erect or geniculate at the lower nodes; sheaths often ciliate on the margins above, occasionally hairy across the collar, otherwise glabrous or hairy; blades flat to folded, 3-10 (18) mm wide, strongly scabrous; ligule a ciliate membrane 1-2.5 mm long; panicle cylindrical, rarely interrupted, 2-9 (16) cm long, the axis antrorsely scabrid-puberulent to more often spreading-hairy, each spikelet subtended by 1-4 (5) greenish or purple, antrorsely scabrous bristles (4) 5-12 (14) mm long; spikelets plano-convex, elliptical, 1.8-2.7 mm long; glumes greenish, unequal, the second subequal to the spikelet; lemma of the reduced lower floret similar to the second glume, about equal to the lemma of the upper perfect floret; lemma of the upper floret at maturity hardened, glossy, minutely papillose to obscurely cross-wrinkled and often brown-spotted at maturity; $2n = 18, 35, 36$. Weed of dry to moist sites at 1280 to 2130 m in Box Elder, Cache, Carbon, Duchesne, Garfield, Grand, Kane, Salt Lake, Summit, Tooele, Uintah, Utah, Washington, and Weber counties; native to Eurasia, now circumboreal, south throughout the U. S. and in Mexico; South America; 64 (iii).

Sorghastrum Nash

Perennials; sheaths open; blades flat; ligule membranous, often thickened; inflorescence a narrow, contracted to loose panicle with spikelets borne mostly in pairs on slender, fragile branchlets; one spikelet sessile, the other pedicelled, the latter reduced, often represented only by the pedicel (spikelets at tips of branches in 3s, one sessile, two pedicelled); spikelets lanceolate, (1) 2-flowered, disarticulating below the glumes and falling with the attached pedicel(s) and rachis internode, the lower floret rudimentary or lacking, the upper one perfect; glumes firm or hardened, dorsiventrally compressed, subequal, exceeding the florets, glabrous or hairy; lemma and palea of the lower floret hyaline or lacking, that of the perfect, upper floret hyaline, the midnerve prolonged as a well-developed awn; stamens 3; caryopsis free of but retained within the lemma and palea, the embryo large; $x = 10$.

Sorghastrum nutans (L.) Nash in Small Indiagrass. [*Andropogon nutans* L.; *S. avenaceum* (Michx.) Nash]. Perennial with short stout rhizomes; culms tufted, erect, 0.8-2.5 m tall, the nodes pubescent with stiffly erect hairs; sheaths glabrous or sparsely long-hairy, the margins at the summit usually projected upward as stiff, awl-shaped structures lateral to the ligule; blades long, flat, the lower ones mostly 5-10 mm wide, narrowed at the base and long-tapered to a filiform tip, scabrous, occasionally ciliate above the ligule; ligule (1.5) 2-5 mm long; panicle mostly narrowly oblong, loose, soon turning yellowish to reddish brown, 1-3 (4.5) dm long, the primary branches and slender branchlets mostly glabrous, with a solitary sessile spikelet 6-8 mm long at each node,

each spikelet subtended by a plumose, nonspikelet-bearing pedicel, the terminal spikelet by 2 such pedicels (rarely a vestigial spikelet present); glumes firm to hardened, often darkening with age, hairy at the base and otherwise glabrous or pubescent with hairs 1–2 mm long, the first glume flattened, the second more or less laterally compressed, the awn of the perfect floret (7) 8–20 mm long, twisted, geniculate, and persistent; anthers 3–4 mm long; $2n = 20, 40, 80$. Hanging gardens, along washes, and in disturbed sites at 1200 to 2130 m in Grand, Kane, and San Juan counties; native to the Great Plains, introduced from Wyoming to Arizona, south to Mexico and throughout the eastern U. S.; 8 (ii). Baum (Canad. J. Bot. 45: 1845–1852. 1967) retypifies *S. nutans*, but Gould (1975) rejects his conclusions, which would substitute the name *S. avenaceum* (Michx.) Nash for *S. nutans*.

Sorghum Moench

Annuals or perennials; culms often tall and stout; sheaths open; blades long and flat, usually broad; ligule membranous; inflorescence a usually large, sometimes nodding panicle with spikelets mostly borne in pairs at each node of the branchlets, 1 spikelet sessile and well developed and 1 (2 at branch tips) pedicelled and usually more or less reduced, at maturity usually disarticulating below the sessile spikelet and falling with or without the adjacent internode and pedicel(s); spikelets lanceolate to ovate, 2-flowered, the lower floret reduced, the upper perfect or that of the pedicelled spikelet(s) staminate or neuter, the rachilla not disarticulating; sessile spikelets with glumes subequal, leathery or less often papery, pale turning dark brown, the first flat to somewhat rounded, the second more or less laterally compressed, slightly exceeding the florets, the lower lemma hyaline, the palea lacking, the upper lemma hyaline and awnless or with a geniculate, twisted awn, the palea hyaline; pedicelled spikelets with glumes papery, the lemmas and paleas hyaline or lacking and the spikelets reduced to 1 or 2 glumes; stamens 3; caryopsis free of the lemma and palea, the floret usually retained within the firm glumes, broadly ellipsoidal to subglobose, the embryo $1/2$ – $2/3$ as long as the grain; $x = 10$. Since prehistoric times members of the genus *Sorghum* have been cultivated in Africa and Asia as a source of food and forage. Hybridization and selection have produced many different strains that are, in our area, best treated as belonging to an annual and a perennial species. In their native habitats the two species can be differentiated by several characters, but the plants as they occur in the western hemisphere are so thoroughly introgressed that only the annual and perennial habit serve to distinguish them with any degree of certainty. Various strains of *Sorghum* have a potential for producing dangerous levels of cyanide compounds leading to their prohibition by law as noxious weeds in several southern states. Currently, however, strains with low cyanide potential that pose no danger regardless of environmental or management factors are available (Kingsbury 1964, p. 492).

1. Plants rhizomatous perennials *S. halepense*
— Plants annual, sometimes tillering *S. bicolor*

Sorghum bicolor (L.) Moench Milo or Grain Sorghum. [*Holcus bicolor* L.; *S. vulgare* Pers.]. *Sorghum bicolor* is morphologically indistinguishable from *S. halepense* except for being annual and without rhizomes, and in having a broader range of variation as follows: culms 1–3 m tall; leaf blades 1.2–5 cm wide; spikelet-bearing branchlets not usually shattering; sessile spikelets mostly ovoid to subglobose, the glumes leathery or papery; $2n = 20$. Occasionally cultivated in Utah, escaping and sometimes persisting along ditchbanks and roadways below 1500 m in Grand, Millard, Uintah, Washington, and Wayne counties; native to Eurasia, cultivated in many of the warmer regions of the world, over the last several decades becoming an important crop in the U. S. and in Mexico; 6 (0). *Sorghum bicolor* is a conserved species name (Taxon 24: 176. 1975), encompassing a number of cultivated strains, a widely distributed wild African complex, and the many weedy strains derived from introgression among domesticated grain sorghums and their wild relatives.

Sorghum halepense (L.) Pers. Johnson Grass; Millet. [*Holcus halepensis* L.; *S. miliaceum* (Roxb.) Snowden]. Strongly rhizomatous perennial; culms 0.5–1.5 m tall; sheaths essentially glabrous, sometimes hairy at the summit and across the collar; blades mostly flat, to 9 dm long and 0.4–4 cm wide, usually scabrous on the margins and sometimes densely hairy at the base of the blade; ligule 1.5–3 (5) mm long, ciliate with hairs shorter than the membranous portion, typically densely hairy on the abaxial side; panicle elliptical to lanceolate in outline, 1–6 dm long, compact to open; spikelets in pairs or at branch tips in 3s; sessile spikelet lanceolate to ovate, (3) 4–6.5 mm long, the glumes leathery, glossy, subglabrous to densely hairy, the first glume flat or nearly so, multi-nerved near the minutely toothed apex, the second somewhat laterally compressed and not toothed, the lower floret reduced to a membranous lemma, the upper one perfect with a membranous, ciliate lemma to ca 5 mm long and awnless or terminating in a twisted, geniculate, readily deciduous awn to ca 16 mm long; pedicelled spikelets narrowly lanceolate, 4–7 mm long, the pedicels often densely ciliate, the glumes papery, multi-nerved, the florets staminate or neuter, the lemmas membranous, ciliate; anthers 2.2–3 mm long; $2n = 20, 40, 41, 42, 43$. Weed of ditchbanks and mostly mesic, waste places from 850 to 1500 m in Box Elder, Kane, Piute, San Juan, Salt Lake, Utah, Washington, and Wayne counties; native to Eurasia, cultivated and escaping or introduced as a weed in the southern half of the U. S., in the Northeast, and in warm temperate regions throughout the remainder of the world. In 1937 Maguire reported that *Sorghum halepense* was becoming a common weed in Washington County (Leaf. W. Bot. 2: 23).

Spartina Schreber

Perennials, tufted or rhizomatous, often tall with stout culms; sheaths open; blades firm, flat or involute; ligule a ring of hairs; inflorescence a panicle with few to numerous, appressed to spreading, spike-like branches arising at intervals along a primary axis with the spikelets sessile and strongly overlapping in 2 closely spaced rows along a 3-angled rachis; spikelets narrowly elliptical to lanceolate, strongly compressed laterally, 1 (2)-flowered, dis-

de Wet, J. M. J. 1978. Systematics and evolution of *Sorghum* sect. *Sorghum* (Gramineae). Amer. J. Bot. 65: 477–484.

Warwick, S. J., B. K. Thompson, and L. D. Black. 1954. Population variation in *Sorghum halepense*, Johnson grass, at the northern limits of its range. Canad. J. Bot. 62: 1780–1790.

articulating below the glumes; glumes leathery to hardened, unequal, strongly keeled, the first 1-nerved, the second usually slightly exceeding the floret, 1- to 3 (6)-nerved, awnless or the midnerve prolonged as a mostly short awn; lemmas ultimately firm with a broad membranous margin, strongly keeled, 1- to 6-nerved, usually narrowly obtuse to rounded apically; palea thinner than the lemma, slightly shorter to longer than the lemma; stamens 3; caryopsis retained within the lemma and palea, the embryo nearly as long as the grain; $x = 10$.

Mobberley, D. G. 1956. Taxonomy and distribution of the genus *Spartina*. Iowa State Coll. J. Sci. 30: 471-574.

1. Second glume with an awn (1) 2-8 mm long, overall length 10-25 mm; plants mostly more than 1 m tall; culm blades 6-15 mm wide *S. pectinata*
- Second glume acute or occasionally awn-tipped, overall length 6-10 (11) mm; plants to ca 1 m tall; culm blades 1.5-6 (8) mm wide *S. gracilis*

Spartina gracilis Trin. Alkali Cordgrass. Strongly rhizomatous perennial; culms 0.3-1 m tall, erect; sheaths glabrous; blades firm, 1.5-6 (8) mm wide, to ca 3 dm long, flat or involute upon drying, gradually tapered to more or less filiform tips, mostly scabrous; ligule a ring of hairs 0.5-1.5 mm long; panicle mostly 0.5-2.5 dm long, the 2-10 (12) spikelet branches 1.5-6 (8) cm long, spikelet-bearing to the base or nearly so, mostly appressed to the main axis; spikelets 10-30 per branch, ovate to lanceolate, essentially flat and strongly overlapping, 1-flowered; glumes usually ciliate on the keel, otherwise glabrous or scaberulous to sparsely hairy, the first mostly crescent-shaped, 3-6 (7) mm long, 1-nerved, apically acute, the second narrowly elliptical, 6-10 (11) mm long, shorter to slightly longer than the floret, (2) 3-nerved, the lateral nerves conspicuous on only one side (close to the midnerve and best seen on the ventral surface), acutish or the midnerve prolonged as an awn tip to ca 1 mm long; lemma elliptical to lanceolate, 6-9 mm long, 1-nerved, ciliate on the keel, at least toward the apex; palea thinner in texture and slightly shorter to distinctly longer than the lemma; anthers 2.5-6 mm long; $2n = 40, 42$. Moist to wet, often saline soils, along waterways, in meadows, and in hanging gardens, at 1220 to 1980 m in Beaver, Box Elder, Cache, Daggett, Emery, Garfield, Grand, Juab, Kane, Rich, Salt Lake, Sanpete, Tooele, Uintah, Utah, Wasatch, Washington, and Wayne counties; British Columbia to Ontario and north to the Mackenzie Territory, south throughout the western U. S. and in the Great Plains to Kansas; 63 (ii).

Spartina pectinata Link Prairie Cordgrass or Slough Grass. Strongly rhizomatous perennial; culms mostly 1-2.5 m tall, erect; sheaths glabrous; blades firm, 6-11 (15) mm wide at the base, to ca 6 dm long, flat or involute upon drying, gradually tapered to often filiform tips, typically scabrous on the margins; ligule a ring of hairs 1-3 mm long; panicle 1-4 (5) dm long, the 4-30 spikelet branches mostly 4-10 cm long, spikelet-bearing to the base or nearly so, appressed to the rachis or slightly spreading; spikelets 10-80 per branch, narrowly lanceolate, essentially flat and strongly overlapping, 1-flowered; glumes strongly scabrous to ciliate with short stiff hairs on the keel and sometimes on the lateral nerves, otherwise glabrous or scabrous, the first glume mostly narrowly crescent-shaped, 5-11 mm long, 1-nerved, acute to awn-tipped, the second glume narrowly lance-

olate, 10-25 mm long including the awn, 3-nerved, the lateral nerves closely paralleling the midnerve, the awn (1) 2-7 (8) mm long; lemma narrowly lanceolate, (6.5) 7-9.5 mm long, 1-nerved, coarsely ciliate on the keel at least above; palea subequal to ca 1 mm longer than the lemma; anthers 3-6 mm long; $2n = 40, 42, 70, 80, 84$. Wet, often saline sites along waterways and in meadows below 1520 m in Box Elder, Cache, Grand, and Uintah counties; British Columbia to Nova Scotia and through much of the U. S.; 10 (i).

Sphenopholis Scribn.

Annuals or short-lived perennials; culms solitary or tufted; sheaths open; blades lax, flat; ligule membranous; inflorescence a compact to loose, erect or nodding panicle; spikelets flattened, (1) 2- or 3-flowered, disarticulating below the glumes and falling as a unit, the rachilla prolonged beyond the uppermost floret as a slender bristle, sometimes bearing a rudimentary floret; glumes laterally compressed, more or less keeled, dissimilar in size and shape, the first narrow, 1 (3)-nerved, the second broad, obovate to oblanceolate, 3 (5)-nerved, broadly membranous-margined, usually shorter than the lowermost lemma; lemma firmer than the glumes, laterally compressed, rounded on the back to somewhat keeled, obscurely 5-nerved, awnless, or occasionally an awn arising just below the apex; palea hyaline throughout, smaller than the lemma; stamens 3; caryopsis free within the lemma and palea, oblong, terete or slightly compressed; $x = 7$.

Erdman, K. S. 1965. Taxonomy of the genus *Sphenopholis* (Gramineae). Iowa State J. Sci. 39: 289-336.

Sphenopholis obtusata (Michx.) Scribn. Prairie Wedgegrass. [*Aira obtusata* Michx.; *S. intermedia* (Rydb.) Rydb.; *S. longiflora* (Vasey) A. S. Hitchc.; *S. pallens* sensu Scribn.]. Annual or short-lived perennial; culms 2-10 (15) dm tall; sheaths glabrous or scabrous to pubescent; blades flat, 1.5-8 (12) mm wide, typically scabrous; ligule 0.5-3.5 mm long; panicle spikelet to open, (3) 5-20 (25) cm long, 0.5-2 cm wide; spikelets flattened, 1.5-5 mm long, (1) 2- or 3-flowered; glumes dissimilar, the first linear, 1-3 (4) mm long, 1-nerved, acute or nearly so, narrowly membranous-margined, scaberulous on the keel, the second oblanceolate to obovate, 3-4 times as wide and usually slightly longer than the first, 3- to 5-nerved, rounded above to faintly mucronate, broadly membranous-margined, the lateral nerves often scaberulous, from slightly shorter to as long as the lowermost lemma; lemma lanceolate, 1.5-3 (4.4) mm long, obscurely nerved, glabrous or minutely pustulose to scaberulous, especially toward the awnless apex; anthers 0.3-0.7 mm long; $2n = 14$. Periodically moist sites, chiefly along waterways, in meadows, near seepage in rock formations, and in aspen-spruce-fir communities, rarely on open hillsides, at 1220 to 2740 m in Beaver, Cache, Duchesne, Garfield, Grand, Juab, Kane, Millard, Rich, San Juan, Tooele, Uintah, Utah, Washington, and Wayne counties; Alaska to Newfoundland, south throughout the U. S. and in Mexico; 44 (0).

Sporobolus R. Br.

Annuals or perennials; sheaths open; blades flat, folded, or involute; ligule a ring of hairs or a short, ciliate membrane; inflorescence a panicle, terminal and occa-

sionally axillary, spikelike to open and diffuse, often partially enclosed in the subtending sheath, spikelets 1-flowered, subterete to strongly laterally compressed, disarticulating above and occasionally below the glumes, pale to dark gray green; glumes thin to moderately firm, subequal to unequal, 1-nerved, keeled to rounded on the back, the second shorter to slightly longer than the lemma; lemma usually similar to the glumes in texture, lanceolate to boat-shaped, 1-nerved, acute to subacute apically, glabrous or scaberulous; palea shorter to slightly longer than the lemma, sometimes apically split at maturity and appearing to be a second lemma; stamens 3; caryopsis with seed free of the pericarp at maturity and ejected from the floret when the pericarp swells upon becoming wet, ovate to obovate, somewhat asymmetrical and compressed, the surface sculptured, the embryo 1/2–3/5 as long as the seed; $x = 9$.

Riggins, R. 1977. A biosystematic study of the *Sporobolus asper* complex (Gramineae). Iowa State J. Res. 51: 287–321.

- 1. Panicles at maturity pyramidal, 1–8 cm long; lemmas to 2 mm long; plants usually annual and less than 2 (0.5–3) dm tall *S. pulvinatus*
- Panicles at maturity spikelike to open, either the panicles more than 8 cm long or the lemmas averaging more than 2 mm long; plants nearly always perennial and more than 2 dm tall 2
- 2(1). Spikelets 3.5–7 mm long; lemmas abruptly acute to obtuse; panicles narrow; anthers 1.5–3 mm long. *S. asper*
- Spikelets averaging less than 3.5 (1.5–4) mm long; either the lemmas sharply acute or the panicles open; anthers 0.2–1.5 (1.7) mm long 3
- 3(2). Panicles spikelike, rarely the lower portion somewhat loose, the branches spikelet-bearing to the base; glumes and lemmas typically keeled 4
- Panicles ultimately open, the branches not consistently spikelet-bearing to the base; glumes and lemmas keeled or rounded on the backs 5
- 4(3). Culms to 10 (12) dm tall and to 5 mm thick at the base; glumes typically roughened to scaberulous on the keel; caryopses rarely more than 1.2 mm long ... *S. contractus*
- Culms 6–20 dm tall and 2–12 mm thick at the base; glumes typically smooth or nearly so on the keel; caryopses 1.3–1.7 mm long *S. giganteus*
- 5(3). Glumes and lemmas mostly rounded on the back and typically smooth on the midnerve (at 20x magnification); mature anthers averaging more than 1 (1–1.7) mm long; primary panicle branches 3–15 cm long, old sheath bases persistent, thickened, straw colored and slick, typically a conspicuous feature *S. airoides*
- Glumes and lemmas keeled and typically scaberulous on the midnerve (at 20x magnification); anthers 0.2–1 mm long; primary panicle branches mostly less than 6 cm long; old sheath bases not a consistently conspicuous feature 6
- 6(5). Pedicels and usually the branchlets appressed to the rachis, the primary branches thus more or less spike-like; plants general in distribution *S. cryptandrus*
- Pedicels and branchlets soon widely spreading, the primary branches loosely flowered, not at all spikelike; plants restricted to the southern half of Utah (Millard and Emery counties southward) *S. flexuosus*

Sporobolus airoides (Torr.) Torr. Alkali Saccaton. Perennial; culms typically densely tufted, often forming large clumps and dying out in the center, (3) 4–20 dm tall,

erect or decumbent-based; sheaths glabrous throughout or long-hairy on the margins at the summit, old sheath bases persistent, typically broad, loose, straw colored and slick, forming a conspicuous feature; blades flat or involute, 2–4 (6) mm wide and to ca 4 dm long, typically scaberulous, often long-hairy at the base; ligule a short ring of hairs, often anterior to long hairs at the base of the blade; panicle open, pyramidal, 10–45 cm long, the branches loosely flowered, naked below, mostly 3–15 cm long, the branches, branchlets, and pedicels typically smooth and ascending to widely spreading; spikelets subterete, 1.3–3 mm long, disarticulating above and often below the glumes, pale green to brownish or dull purple; glumes thin, unequal, rounded on the back, glabrous, the first 0.4–2 mm long, acute, the second 1.2–2.8 mm long, acute or obtuse, shorter or in some spikelets slightly longer than the lemma; lemma thin, 1.7–3 mm long, acute or rarely obtuse, glabrous; palea about equal to the lemma; anthers (1) 1.2–1.5 (1.7) mm long; caryopsis ca 1 mm long; $2n = 80, 108, 126$. According to Gould and Moran (1981), the species is comprised of two varieties:

- 1. Culms to ca 1 m tall; panicle branches in age widely spreading, the branchlets naked below, the pedicels ultimately spreading; plants with the range of the species *S. airoides* var. *airoides*
- Culms commonly 1–2 m tall; panicle branches in age ascending, the branchlets spikelet-bearing to the base, the pedicels mostly appressed in age; plants restricted to Washington County *S. airoides* var. *wrightii*

Var. *airoides* [*Agrostis airoides* Torr.]. Dry to moist sites, in salt grass, salt desert shrub, desert shrub, sagebrush, and pinyon-juniper communities, along waterways, roadsides, and occasionally on open slopes, at 800 to 2350 m in all Utah counties except Davis, Iron, Morgan, Rich, Summit, and Wasatch; throughout the western U. S., in the Great Plains, Texas, Missouri, and Mexico; 172 (v).

Var. *wrightii* (Munro ex Scribn.) Gould [*Sporobolus wrightii* Munro ex Scribn.]. Rocky slopes and open ground, often in saline soils, below 1220 m in Washington County; southwestern U. S., east to Oklahoma, south into Mexico; 2 (0). Alkali saccaton provides an abundance of moderately palatable forage in spring, particularly in areas dominated by greasewood (Valentine 1961). It is drought-tolerant, performing well in areas with a mean annual precipitation of 30–46 cm (Thornburg 1982).

Sporobolus asper (Michx.) Kunth Tall Dropseed. [*Agrostis aspera* Michx.]. Perennial, occasionally short-rhizomatous; culms solitary or tufted, erect, 2–13 dm tall; sheaths glabrous throughout or ciliate at the summit; blades flat to involute and often flexuous, mostly 1–5 mm wide and to ca 5 dm long, scabrous to pubescent or rarely long-hairy; ligule a ring of very short hairs, usually with lateral tufts of hairs to 4 mm long or longer; panicle narrow and compact, 5–30 cm long and to ca 1.6 cm wide when pressed, generally partially included within the sheath at maturity, the branches and pedicels appressed-erect or some of them slightly spreading, the plants often bearing shorter, mostly included axillary panicles with cleistogamous spikelets; spikelets strongly compressed, 3.5–7 (8) mm long, disarticulating above the glumes, pale green or whitish to dark gray green or dull purple; glumes thin to moderately firm, unequal or subequal, mostly keeled, acute to obtuse at the apex, glabrous or more often

scaberulous on at least the upper part of the keel, the first 1.7–4.7 mm long, the second 2.5–6.2 mm long, mostly distinctly shorter than the lemma; lemma similar to or firmer than the glumes in texture, boat-shaped, (3.5) 4–6 (7) mm long, glabrous or scabrous on the keel, abruptly acute or obtuse; palea about equal to the lemma; anthers 1.5–3 mm long; caryopses mainly 1.6–2 mm long; $2n = 54, 88, 108$. Dry, often sandy sites in juniper communities and in fallow fields below 1530 m in Grand, Uintah, and Utah counties; sporadic in the western U. S., throughout the remainder of the states except in the Southeast; 4 (0).

***Sporobolus contractus* A. S. Hitchc.** Spike Dropseed. This species strongly resembles *S. giganteus*, differing only as follows: culms to 10 (12) dm tall and to ca 5 mm thick at the base; blades flat or involute throughout upon drying, 1.5–8 mm wide and to ca 3.5 dm long; ligule a dense ring of hairs mostly 0.4–0.7 mm long; panicle 15–35 (50) cm long and 0.3–0.8 (1) cm wide; spikelets 1.7–3.2 mm long; glumes roughened to scaberulous (at 20x magnification) on the keel and usually laterally, especially toward the apex; caryopses to 1.2 (1.3) mm long. Dry or periodically moist, mostly sandy, occasionally saline soils, chiefly in desert shrub-grass and pinyon-juniper communities below 1980 m in Beaver, Carbon, Daggett, Emery, Garfield, Grand, Kane, Millard, San Juan, Tooele, Uintah, Washington, and Wayne counties; throughout the southwestern U. S., east to Oklahoma, south to Texas and in Mexico; 43 (0). In brief, *S. contractus* is less robust than *S. giganteus*, has a wider distribution, and less frequently occupies roadside areas. Although the two species can usually be distinguished as outlined in the key, they are known to grow side by side, and an occasional plant can be only arbitrarily assigned one name or the other. Plants with panicles bearing large numbers of sterile spikelets suggest that hybridization between the two species is occurring. *Sporobolus cryptandrus* differs from *S. contractus* chiefly in having spreading branches. Because the lower branches of *S. contractus* may sometimes be somewhat spreading and because those of *S. cryptandrus* are initially appressed, an occasional herbarium specimen may be difficult to identify. On a population basis, however, these taxa are readily differentiated. Spike dropseed is useful for dune stabilization, especially in areas of the Southwest where the mean annual precipitation is only 18–30 cm.

***Sporobolus cryptandrus* (Torr.) Gray** Sand Dropseed. [*Vilfa cryptandra* Torr.]. Perennial, sometimes appearing annual; culms solitary or in mostly small tufts, often from a hard knotty base, (2) 3–10 (12) dm tall, erect or curved-ascending to prostrate; sheaths ciliate at the summit and often along the upper margins, the hairs 1–4 mm long, sometimes extending across the collar, persistent old sheath bases often present but not a consistently conspicuous feature; blades flat to involute toward the long-tapered tips, 1–5 (8) mm wide and to ca 3 dm long, more or less scaberulous; ligule a dense ring of hairs to 0.5 mm long; panicle ultimately open, pyramidal to oblong, 1–3 (4) dm long, usually remaining partly included within the subtending sheath, the primary branches 1 or 2 per node, ascending to widely spreading or occasionally deflexed, mostly 1–6 cm long, naked near the base, the short pedicels and usually the branchlets erect-appressed, smooth or scaberulous, the pulvini at base of panicle branches glabrous or short-hairy; spikelets subterete to compressed, 1.5–2.5 mm long, disarticulating

above and sometimes below the glumes, pale to dark gray green or dull purple; glumes thin, unequal, keeled, acute, typically scaberulous on the keel and often laterally, the first 0.6–1 mm long, the second 1.4–2.5 mm long, slightly shorter to longer than the lemma; lemma thin, 1.5–2.5 mm long, acute, scaberulous on the upper midnerve and sometimes laterally (at 20x magnification); palea about equal to the lemma; anthers 0.2–1 mm long; caryopses ca 1 mm long; $2n = 18, 36, 38, 72$. A weed of roadsides and other waste places, in desert shrub, sagebrush, and pinyon-juniper communities, occasionally in salt desert shrub, aspen-fir, and ponderosa pine communities, streamside, and on grassy slopes, at 850 to 2870 m in all but Morgan, Rich, Summit, and Wasatch counties; British Columbia to Quebec, south through the U. S. (except in the Southeast), and in Mexico; 218 (vi). Sand dropseed is a relatively good source of spring forage. Although the palatability of the mature plant is low, growth in sandy desert sites is often renewed in the fall, the green basal leaves providing forage into the winter. The plant is useful for range seeding on dry, sandy lowlands receiving less than 22.5 cm annual precipitation (Vallentine 1961). Being a prolific seed producer, the plant increases on depleted ranges and wastelands.

***Sporobolus flexuosus* (Thurber) Rydb.** Mesa Dropseed. [*Vilfa cryptandra* var. *flexuosa* Thurber]. Perennial, sometimes appearing annual; culms solitary or more often in small tufts, typically erect, 3–10 (12) dm tall; sheaths densely long-hairy at the summit and often ciliate along the margins; blades flat or folded, becoming involute, at least toward the long-tapered tips, 1–4 (6) mm wide and to ca 2 dm long, smooth or the margins scaberulous; ligule a dense ring of short hairs; panicle open, oblong, 10–30 cm long, often remaining partially included within the subtending sheath, the primary branches ascending to widely spreading or deflexed, mostly 1–6 cm long, typically rebranched near the base, the branchlets and usually the pedicels soon becoming widely spreading to deflexed, the pulvini at the base of the lower panicle branches often long-hairy; spikelets indistinguishable from those of *S. cryptandrus*; caryopses ca 1 mm long; $2n = 36, 38$. Desert shrub, sagebrush, and pinyon-juniper communities from 850 to 1710 m in Emery, Garfield, Grand, Kane, Millard, San Juan, Washington, and Wayne counties; most of the southwestern U. S., east to Texas, and in Mexico; 93 (ii). Mesa dropseed is valuable for stabilization of loose sandy soils. It survives and reseeds readily in areas with as little as 15–18 cm mean annual precipitation (Thornburg 1982). The tangled masses formed from adjacent panicles are characteristic of this plant.

***Sporobolus giganteus* Nash** Giant Dropseed. Perennial; culms solitary or tufted, erect, 6–20 dm tall and 2–12 mm thick near the base; sheaths typically ciliate along the margins, densely so at the summit, the hairs variable in length, occasionally extending onto the collar, old sheath bases sometimes present but not a consistently conspicuous feature; blades flat or folded, becoming involute toward the tips, 2.5–10 mm wide and to ca 5 dm long, smooth or the margins scaberulous; ligule a dense ring of hairs 0.5–1.5 mm long; panicle spikeletlike or occasionally somewhat interrupted below, 25–70 cm long and 0.5–2 cm wide, typically remaining partly or sometimes entirely included within the subtending sheath, the

branches spikelet-bearing to the base, appressed to the main axis or occasionally those of the lower portion of the panicle spreading, those above remaining erect or nearly so; spikelets compressed, 2.5–3.5 (4) mm long, disarticulating above and ultimately below the glumes, pale to gray green; glumes thin, unequal, narrow, acute, essentially smooth on the prominent keel, glabrous to slightly scaberulous laterally (at 20x magnification), the first 0.7–2 mm long, the second 2–3.5 (4) mm long, slightly shorter to barely longer than the lemma; lemma thin, 2.5–3.5 (4) mm long, similar to the second glume; palea slightly shorter than the lemma; anthers 0.5–1 mm long; caryopses (1.3) 1.5–1.7 mm long; 2n = 36. Sandy soil in desert shrub and juniper communities, often on sand dunes or in roadside areas below 1830 m in Carbon, Emery, Garfield, Grand, Kane, San Juan, Utah, Washington, and Wayne counties; through most of the southwestern U. S. and in Texas, Kansas, Oklahoma, and northern Mexico; 16 (ii). See *S. contractus*. Giant dropseed is useful for dune stabilization in areas where the mean annual precipitation is 18–30 cm (Thornburg 1982).

Sporobolus pulvinatus Swallen Cushion Dropseed. Annual or short-lived perennial; culms solitary or tufted, 0.5–1.5 (3) dm tall, erect to spreading or geniculate at the lower nodes; sheaths glabrous throughout or sparsely long-hairy at the summit; blades flat, 1–5 mm wide and to ca 7 cm long, typically scaberulous and often sparsely long-hairy, the uppermost culm blade often much reduced; ligule a ring of hairs to ca 0.5 mm long; panicle open, pyramidal, 1–8 cm long, at maturity free of the subtending sheath, the lowermost primary branches whorled, naked at the base, the short pedicels erect-appressed; spikelets compressed, 1.5–2 mm long, pale to dark gray green; glumes unequal, more or less keeled, the first 0.3–0.7 mm long, the second 1.3–2 mm long, about equal to the lemma or nearly so; lemma 1.3–2 mm long, abruptly acute, glabrous or the upper midnerve scaberulous; palea about equal to the lemma; anthers to ca 0.3 mm long; caryopses to 1 mm long; 2n = 24, 36, 54. Known in Utah by a single collection (Harrison 12183 BRY, UTC) from sparsely vegetated desert pavement at about 1460 m in San Juan County; Colorado, Arizona, New Mexico, Texas, and northern Mexico; 2 (0).

Stipa L.

Tufted perennials, rarely annuals; culms generally erect; leaves often chiefly basal; sheaths open, the basal portion from previous years frequently persistent and conspicuous; blades involute or less often flat to folded; ligule membranous or rarely a ring of hairs; inflorescence a spike-like to open panicle; spikelets terete or slightly compressed, 1-flowered, disarticulating above the glumes; glumes moderately firm to largely or entirely membranous, lanceolate to lance-elliptical or occasionally ovate, equal or unequal, the first often longer than the second, both exceeding the body of the lemma, 1– to 5 (9) -nerved, acute to more often long-tapered to a sharply acute tip; lemma at maturity stiffly membranous to leathery or hardened, subglobose to narrowly elliptical, (3) 5-nerved, mostly obscurely so, generally hairy to some degree on the body, the apex awned, the junction of awn and lemma distinct, the awn persistent or in a few species readily deciduous, usually once or twice abruptly bent, the lower 1 or 2 segments typically more or less twisted; callus well developed, obtuse to sharply acute, bearded;

palea hyaline to stiffly membranous, 2-nerved, obscured by the overlapping margins of the lemma except at flowering in a few species; stamens 3, the anthers in some species bearing at the apex a minute tuft of hairs; caryopsis closely invested by the lemma and palea, the embryo 1/6–1/3 as long as the grain; x = 11. The treatment of *Stipa* was reviewed by M. E. Barkworth. Species of *Stipa* hybridize more or less freely among themselves (Gould and Shaw 1983) and with the species traditionally known as *Oryzopsis hymenoides* (Johnson 1945, 1972), here included in the genus *Stipa*. Hybrids involving *S. hymenoides* have been particularly well documented, possibly because they are easiest to recognize (see *S. x bloomeri*).

Note: In the following key and descriptions, panicle length excludes the awns; lemma measurements include the callus but neither the apical hairs (when present) nor the awn.

1. Awn deciduous, the lemma pubescent throughout with hairs 1–4 mm long, sometimes ultimately glabrate 2
- Awn persistent, the lemma variously pubescent 3
- 2(1). Panicle at maturity open, the elongate branches mostly dichotomously branched and divaricate; lemmas less than 3 times as long as wide, the awn 3–6 mm long *S. hymenoides*
- Panicles contracted to somewhat open, the short to long branches erect or ascending and variously re-branched; lemmas at least 3 times as long as wide, the awn 7–20 mm long *S. x bloomeri*
- 3(1). Awns of the lemmas averaging more than 50 (53–240) mm long 4
- Awns of the lemmas averaging no more than 50 mm long 6
- 4(3). Lemma 4–6 mm long *S. arida*
- Lemma 8–19 mm long 5
- 5(4). Terminal awn segment pubescent with hairs 1.5–3 mm long *S. neomexicana*
- Terminal awn segment scabrous or puberulent with hairs to about 1 mm long *S. comata*
- 6(3). Awn pubescent near the base with hairs averaging more than 0.5 (0.5–9) mm long 7
- Awn glabrous or scabrous throughout or, if pubescent, the hairs averaging less than 0.5 mm long . . . 8
- 7(6). Lower awn segment with hairs 3–9 mm long
 *S. speciosa*
- Lower awn segment with hairs 0.5–2 mm long
 *S thurberiana*
- 8(6). Awn (35) 40 mm or longer, flexuous or weakly once-geniculate, the upper portion hairlike or nearly so *S. arida*
- Awn averaging less than 35 (3–35) mm long, typically once or twice geniculate, the upper portion variable . . . 9
- 9(8). Lemma densely hairy with apical or lateral hairs at least 2 mm long 10

- Lemma glabrous above or sparsely pubescent with hairs nearly always less than 2 mm long 12
- 10(9). Sheaths at base of plant terete and mostly less than 1 mm wide, often grayish and usually inconspicuous; blades typically less than 1 mm wide; callus sharply acute *S. pinetorum*
- Sheaths at base of plant loose, often flattened, more than 1 mm wide, usually straw colored, more or less thickened, papery, and typically forming a conspicuous feature; blades 1–7 mm wide; callus blunt (at 10x magnification) 11
- 11(10). Awn 8–14 mm long, once geniculate; palea long-hairy throughout, the hairs surpassing the tip *S. coronata* var. *depauperata*
- Awn 12–25 mm long, once or twice geniculate; palea glabrous or sparsely hairy below, the hairs not surpassing the tip *S. coronata* var. *parishii*
- 12(9). Joint between awn and lemma oblique, not obscured by hairs, the apical margin of the lemma thickened, forming a minute unilateral "hump" on the mature fruit; palea nearly as long as the lemma *S. lemmonii*
- Joint between awn and lemma horizontal, in some species obscured by hairs, the apical margins of the lemma either membranous or not prolonged; palea not more than 2/3 as long as the lemma 13
- 13(12). Palea less than half as long as the lemma, glabrous; lemma at maturity narrowed toward the apex into a whitish "neck" to about 1 mm long, the joint between lemma and awn not obscured by the scant apical hairs; plants introduced, occupying disturbed habitats *S. viridula*
- Palea either at least half as long as the lemma or pubescent to some degree; lemma at maturity not consistently white at the apex, the joint between lemma and awn often obscured by the apical hairs; plants native, generally forming large populations in native habitats (the next two species occasionally intergrading) 14
- 14(13). Palea at least 2/3 as long as the lemma; awns typically averaging no more than 22 (10–23) mm long; callus to about 0.7 mm long, the glabrous tip blunt; plants usually less than 6 dm tall; leaf blades mostly involute, 0.5–2 mm wide. *S. lettermanii*
- Palea about half as long as the lemma; awns averaging more than 20 mm long; callus 0.7–1.5 (3) mm long, the glabrous tip acute and usually curved; plants to 15 dm tall; leaf blades often flat, frequently at least some of them more than 2 mm wide *S. nelsonii*

Stipa arida Jones Mormon Needlegrass. [*S. mormonum* Mez, type from near Milford, Beaver County]. Tufted perennial; culms relatively slender, 3–8 (10) dm tall; sheaths glabrous or scabrous, occasionally minutely hairy just below the collar or ciliate near the summit, old sheath bases persistent; blades involute-filiform, those of the culm rarely flat and then 0.8–2.5 mm wide, scabrous and often puberulent; ligule 0.2–1.5 mm long; panicle narrowly oblong, 0.4–3 dm long, the branches to ca 6 cm long and erect to slightly divergent, the base of the inflorescence typically remaining enclosed in the upper sheath; glumes ultimately membranous throughout or nearly so, pale and shiny, narrowly lanceolate, unequal or occasionally equal or nearly so, long-tapered to sharply acute tips, 3 (5)–nerved, mostly obscurely so, glabrous or sparsely scaberulous, the first (8) 9–15 mm long, the second 7–10 (11) mm long; lemma pale or at maturity dark brown and papery, 4–6 mm long, lacking free apical

margins, more or less sparsely short-pubescent throughout or glabrous above, the hairs less than 0.7 mm long, the awn (35) 40–75 mm long, slender, sometimes weakly once geniculate, more or less twisted on the lower 1–2 cm, straight to flexuous and hairlike or nearly so above, scaberulous below or glabrous throughout; callus to ca 1 mm long, curved, with a sharply acute, abaxially glabrous tip to ca 0.5 mm long; palea about half as long as the lemma, hairy; anthers 2–3 mm long. Chiefly on rocky sites in blacksage, shadscale, sagebrush, and pinyon-juniper communities from 1050 to 2300 m in Beaver, Emery, Garfield, Grand, Juab, Kane, Millard, Piute (type from near Marysville), San Juan, Tooele, Washington, and Wayne counties; California east to Colorado and south through Arizona and New Mexico to Texas; 70 (ii).

Stipa x bloomeri Bolander Bloomer Ricegrass. [*Oryzopsis bloomeri* (Bolander) Ricker; x *Stiporyzopsis bloomeri* (Bolander) B. L. Johnson]. Tufted perennial; culms erect, (1) 3–9.5 dm tall; sheaths glabrous or scaberulous to variously pubescent, the old sheath bases typically persistent; blades flat to involute, to ca 2 mm wide, often long-tapered to filiform tips, smooth or scaberulous; ligule mostly 1–4 mm long; panicle contracted to somewhat open, 0.6–3.5 dm long, the branches mostly 2–7 cm long or longer, erect or more or less divergent; glumes greenish below or membranous throughout, occasionally purple-tinged, subequal or unequal, (4.5) 5–11 mm long, broad below, long-tapered to a finely acute or awnlike tip, obscurely or conspicuously nerved, glabrous or scaberulous; lemma at maturity leathery, mostly 4–5.8 mm long and at least 3 times as long as wide, sparsely to densely pubescent with spreading to appressed hairs mostly 1–3 mm long, the awn more or less readily deciduous, 7–20 mm long or longer, usually once geniculate, the lower segment twisted and scabrous to pubescent; callus to ca 1 mm long with a blunt to acute, glabrous or hairy tip; anthers 1.2–5.5 mm long, often bearing a minute apical tuft of hairs, the pollen typically undeveloped. Dry, mostly open sites, at 2130 to 2750 m in Garfield, Iron, Utah, and Washington counties (and likely to occur throughout the range of *S. hymenoides*); throughout the western U. S. and in South Dakota; 37 (i). Although Johnson (1945) originally applied the name x *Stiporyzopsis bloomeri* only to the hybrid between *Stipa hymenoides* (as *Oryzopsis hymenoides*) and *S. occidentalis*, additional hybrids between *S. hymenoides* and 10 other *Stipa* species are sufficiently similar to the hybrid with *S. occidentalis* to collectively bear the name, here revised to *S. x bloomeri*. Of those species occurring in our area, the following are reported to have formed hybrids with *S. hymenoides*: *S. viridula*, *S. thurberiana*, *S. neomexicana*, *S. speciosa*, *S. pinetorum*, and *S. nelsonii* (Johnson 1972).

Stipa comata Trin. & Rupr. Needle-and-thread Grass. Tufted perennial, often glaucous; culms 3–13 dm tall; sheaths glabrous or scabrous, the old bases persistent; blades flat or involute, 1–2 (3) mm wide, smooth or scabrous to puberulent; ligule 1.5–9 mm long; panicle contracted to somewhat open, 0.7–4 dm long, often nodding, the branches few flowered, appressed to somewhat divergent; glumes ultimately membranous throughout or nearly so, equal or subequal, 15–40 mm long, long-tapered to filiform tips 5–20 mm or more long, the first 5–nerved, the second 5– to 7–nerved, usually conspicuously so; lemma brown and leathery at maturity, 8–17

mm long, sparsely short-hairy throughout or glabrate near the apex, the awn (53) 60–240 mm long, once or twice geniculate, sometimes weakly so, the lower half twisted, scabrous to pubescent with hairs to ca 1 mm long, the upper segment mostly flexuous and scaberulous, occasionally the awn short-hairy throughout, the hairs of the lower portion longer than those above (unlike *S. neomexicana*); callus (2) 3–6 mm long with a sharply acute, glabrous tip 0.5–0.8 mm long; palea subequal to the lemma, firm, glabrous or sparsely hairy; anthers to ca 8 mm long; $2n = 38, 44–46$. Chiefly in salt desert shrub, desert shrub, sagebrush, pinyon-juniper, and mountain brush communities, occasionally in openings in aspen, lodgepole pine, and ponderosa pine, from 1060 to 3050 m in all Utah counties except Iron, Morgan, Summit, and Weber; Alaska to Ontario, south throughout the western U. S. and the Great Plains to Texas, sporadic in the eastern U. S.; 263 (vii). The Utah material I have seen is var. *comata* with the terminal segment of the awn flexuous and usually well over 50 mm long, and with the lower branches of the panicle generally included in the sheath. See *S. neomexicana* for a discussion of its relationship to *S. comata*. Needle-and-thread grass produces highly palatable early spring forage and is a good source of fodder in fall and winter, although on the summer range mature fruit frequently causes mechanical injury to grazing animals (Vallentine 1961). The grass grows in areas with mean annual precipitation of less than 25 cm and does well on sandy or gravelly sites (Thornburg 1982).

Stipa coronata Thurber Crested Needlegrass. The *S. coronata* complex is comprised of tufted perennials characterized by light green to glaucous herbage; papery, persistent sheath bases; firm, erect to recurved leaf blades long-tapered to involute tips; a short (to 2 mm long) ligule; relatively firm, conspicuously nerved glumes, a lemma pubescent with hairs 2–5 mm long, and a palea 1/2–2/3 as long as the lemma. As described by Hitchcock (1951), the species consists of two varieties: var. *coronata* with culms 10–20 dm tall, panicles 3–4 dm long, and lemmas with a twice-geniculate awn 40–50 mm long, the plants ranging from southern California to Arizona (?), south to northern Mexico; and var. *depauperata* (Jones) A. S. Hitchc. with culms 3–5 dm tall, panicles 1–1.5 dm long, and lemmas with a once-geniculate awn to about 2.5 cm long, the plants ranging from southern California to Nevada, Utah, and Arizona. In addition to the typical element of the species, which does not enter Utah, the complex as it occurs in the state appears to be composed of two previously undifferentiated entities:

1. Culms 2–7 (8) dm tall, erect; sheaths ciliate with a small tuft of hairs lateral to the ligule; blades 2–6 dm long and 1.4–6 mm wide; panicles 1–2.6 dm long; lemma 6–8.5 mm long, the apical hairs 2–3 mm long, the awn (12) 17–25 mm long and once or weakly twice geniculate; callus with a minute, often obscure, knoblike glabrous tip; palea glabrous or sparsely hairy below, the hairs not surpassing the tip; anthers 3.5–5 mm long *S. coronata* var. *parishii*
- Culms 1–4 (5) dm tall, erect to decumbent-based, sheaths glabrous or minutely ciliate, lacking longer tufts of hairs lateral to the ligule; blades to ca 1.5 dm long and 1–2.5 mm wide; panicles 0.4–1.5 dm long; lemma 5–7(8) mm long, the apical hairs 3–5 mm long, the awn 8–14 mm long and once geniculate; callus with an oblong, abaxially glabrous tip to ca 0.3 mm long; palea hairy throughout, the hairs extending beyond the tip; anthers 2–3.5 mm long *S. coronata* var. *depauperata*

Var. *depauperata* (Jones) A. S. Hitchc. [*S. parishii* var. *depauperata* Jones, type from Juab County]. Salt desert shrub, desert shrub, sagebrush, and pinyon-juniper communities at 1500 to 2700 m in Beaver, Juab, Millard, Tooele, and Washington counties; Nevada; 41 (0).

Var. *parishii* (Vasey) A. S. Hitchc. [*S. parishii* Vasey]. Desert shrub, sagebrush, and pinyon-juniper communities, from 1585 to 1830 m in Garfield, Kane, and San Juan counties; California, Nevada, and Arizona; 25 (0). The complex, as it occurs throughout its range, is currently being studied (M. E. Barkworth, pers. comm. 1986); and one or both of the taxa described above may prove to merit species status. In any case, the names applied here are tentative. *Stipa scribneri* Vasey, which differs from the *S. coronata* complex in combining a sharply acute callus with a palea less than half as long as the lemma, is reported from Utah by Johnson (1972); but I have seen no material with this combination of characters and suggest that the plants reported as *S. scribneri* were actually *S. coronata* var. *parishii*. Two collections from the western Great Basin that outwardly resemble *S. coronata* var. *parishii* may prove to be a previously undescribed species.

Stipa hymenoides R. & S. Indian Ricegrass. [*Oryzopsis hymenoides* (R. & S.) Ricker]. Densely tufted perennial; culms erect, 2–7 (8.5) dm tall; sheaths glabrous to puberulent, the margins often ciliate, with or without tufts of longer hairs lateral to the ligule, the old bases of previous years thickened and persistent, the uppermost sheath often partially enclosing the panicle; blades elongate, firm, involute and in that state ca 1 mm wide; ligule 2.5–8 mm long; panicle open, 5–20 cm long, the branches slender, often flexuous, usually dichotomously branched, the branchlets mostly 0.5–4 cm long, nearly hairlike and divaricate; glumes initially greenish, soon becoming white-membranous, broadly ovate and saccate, equal or nearly so, 4–8 mm long, 3- to 5-nerved, puberulent to glabrous or nearly so, abruptly tapered to a slender tip mostly 3–6 mm long; lemma at maturity hardened, glossy brown to black, subglobose to fusiform, 2.5–5 mm long and to ca 3 mm wide, less than 3 times as long as wide, densely pubescent with hairs 2–4 mm long or sometimes glabrate, the awn readily deciduous, 3–6 mm long, stout, straight or nearly so; callus 0.5–1 mm long, obtuse to sharply acute, long-hairy throughout; palea similar to the lemma in texture, color, and length; anthers 0.8–1.5 mm long, with an apical tuft of hairs; $2n = 28, 48, 65, 130$. Chiefly dry, open, often sandy sites, in greasewood, creosote bush, shadscale, sagebrush, mountain brush, pinyon-juniper, and ponderosa pine communities, occasionally at margins of aspen-spruce-fir communities, at 750 to 2750 m in all Utah counties except Morgan; British Columbia to Manitoba, south throughout the western U. S., east through the Great Plains and in Texas; in arid regions of the Pacific slope in Chile; 233 (ii). Originally included in the genus *Stipa*, *S. hymenoides* was transferred to *Oryzopsis* largely because of its short plump caryopsis and its readily deciduous awn. In 1945, Johnson (Bot. Gaz. 107: 1–32) transferred *O. webberi* (Thurb.) Benth. ex Vasey to *Stipa*, thus eliminating the deciduous awn as a character restricted to *Oryzopsis*. An evaluation of floral development in a number of species of *Oryzopsis* led Kam and Maze (Bot. Gaz. 135: 227–247, 1974) to recommend that *O. hymenoides* also be placed in *Stipa*. Subsequently, in a study of the embryological characters

and taxonomy of the Stipeae, Barkworth (Taxon 31: 233–243. 1982) found *S. hymenoides* (as *Oryzopsis hymenoides*) to be the most stiped in its embryological characters of any of the seven species of *Oryzopsis* examined. These data, added to the morphological resemblance of *O. hymenoides* to *Stipa* (e.g., the long callus, lanceolate glume tips, and long-hairy lemma), and its ability to hybridize with ten or more species of *Stipa* (Johnson 1972), make a most convincing case for the return of *O. hymenoides* to the genus *Stipa*. Indian ricegrass is dominant over large desert and semidesert areas where it forms an important source of forage for all classes of livestock. The grass cures exceptionally well and the seeds, which remain on the plant, are high in protein. Strains with an unusually low percentage of nongerminating seeds are recommended for range rehabilitation throughout the Intermountain West (Thornburg 1982).

Stipa lemmonii (Vasey) Scribn. Lemmon Needlegrass. [*Stipa pringlei* var. *lemmonii* Vasey]. Tufted perennial; culms 3–8 dm tall; sheaths glabrous or pubescent, old sheath bases persistent; blades involute-filiform or flat and then 1–2 mm wide, glabrous or scaberulous to puberulent; ligule 1–3 mm long; panicle narrow, 0.5–1.2 dm long, the branches mostly erect; glumes ultimately membranous throughout or nearly so, occasionally purple-tinged, equal or the first slightly shorter than the second, 7–11 mm long, somewhat abruptly tapered to sharply acute or hairlike tips, more or less obscurely (3) 5-nerved; lemma pale or at maturity brown and leathery to hardened, 5.5–7 mm long, sparsely to moderately pubescent with appressed to spreading hairs to ca 1 mm long, the few hairs at the apex typically much shorter, the joint between the awn and the lemma body oblique, the free apical margin of the lemma thickened, forming a firm, unilateral “hump” at the tip of the mature fruit, the awn 10–30 (35) mm long, mostly twice geniculate, the lower 2/3 twisted and puberulent; callus to about 1 mm long with a very short, blunt, glabrous tip 0.1–0.25 mm long; palea firm, nearly as long as the lemma, abruptly acute at the apex, glabrous or inconspicuously hairy; $2n = 34, 36$. Grass and sagebrush communities and open woodlands from 1830 to 2280 m in Cache and possibly Salt Lake (Wasatch Range, Jones s.n., GH) counties; southwestern Canada south through much of the western U. S.; 2 (0). Barkworth and Linman (Madrono 31: 48–56. 1984) found that morphological and distribution data for *S. lemmonii* do not support recognition of infraspecific taxa.

Stipa lettermanii Vasey Letterman Needlegrass. [*S. minor* (Vasey) Scribn.]. Tufted perennial; culms 2–7 (10) dm tall; sheaths glabrous or scaberulous, old sheath bases persistent; blades involute and linear to filiform, rarely flat and then to ca 2 mm wide, smooth or scaberulous to puberulent; ligule 0.2–2 mm long; panicle sublinear to narrowly oblong, mostly 0.4–2 dm long, the branches erect or nearly so; glumes ultimately membranous throughout or nearly so, green or purple-tinged, equal or the second slightly longer than the first, (5) 6–10 mm long, tapered to hairlike tips (these sometimes broken off), 3-nerved, often obscurely so, glabrous or scaberulous; lemma at maturity stiffly membranous, light brown, 4.5–6 mm long, sparsely pubescent throughout, the apical hairs mostly 1–1.7 mm long, equal to or longer than those on the body, the joint between the awn and lemma body horizontal, usually obscured by the apical hairs, the

free margins of the lemma often prolonged at the apex as minute membranous lobes mostly less than 1 mm long, the awn 10–23 mm long, mostly twice geniculate, the two lower segments twisted, glabrous to scabrid-puberulent, the terminal segment glabrous; callus to about 0.7 mm long with a blunt, glabrous tip ca 0.1 mm long; palea exposed at flowering, thin, about 2/3 as long as the lemma, tapered to an acute tip, pubescent; anthers 1.7–2.5 mm long; $2n = 32, 66, 68$. Openings in sagebrush, mountain brush, pinyon-juniper, ponderosa pine, lodgepole pine, aspen, spruce-fir, and occasionally in mountain meadow communities, from 1500 to 3570 m in all Utah counties; throughout most of the western U. S.; 162 (xvii). Discrepancies in the treatment accorded *S. lettermanii* by authors of western manuals (e.g., Gould 1951, Hitchcock et al. 1969, and Harrington 1954) attest to the variation in populations. Of Utah specimens examined, 12 percent failed in at least one varying character to conform with those used in the key herein to separate *S. lettermanii* from the closely related, often sympatric *S. nelsonii*. Specimens from adjoining western states, however, appear to combine characters of both species in a much more confusing pattern of intermediacy. Although the taxa appear unequivocally distinct in Utah despite occasional intergradation, Weber (1976) finds Colorado specimens doubtfully so. Letterman needlegrass provides fair to good forage for cattle, depending upon its abundance (Valentine 1961).

Stipa nelsonii Scribn. Nelson Needlegrass. [*S. columbiana* authors, not Macoun; *S. columbiana* var. *nelsonii* (Scribn.) A. S. Hitchc.; *S. occidentalis* var. *minor* sensu C. L. Hitchc.; *S. williamsii* Scribn.]. Tufted perennial; culms 1–20 dm tall; sheaths glabrous or sparsely to densely pubescent, occasionally ciliate near the summit, old sheath bases more or less persistent; blades flat to involute, 0.5–5 (7) mm wide, smooth or scabrous on the lower surface, glabrous to scaberulous; ligule 0.2–2 mm long; panicle narrow, 0.7–3.6 dm long, 0.5–2 cm wide, the branches erect or strongly ascending; glumes ultimately membranous throughout or nearly so, occasionally purple-tinged, equal or subequal, (6,4) 7–13 mm long, long-tapered to hairlike tips (these sometimes broken off), prominently to obscurely 3 (5)-nerved, glabrous or scaberulous; lemma at maturity stiffly membranous, brown, 4.9–7.2 mm long, appressed-pubescent throughout, the apical hairs mostly 0.5–1.5 mm long, equal to or longer than those on the body, the joint between awn and lemma horizontal, usually obscured by the apical hairs, the free apical margins of the lemma often prolonged as membranous lobes to about 0.5 mm long, the awn mostly 20–30 mm long, usually twice geniculate, the lower segments twisted, some portion of the middle section scaberulous to pubescent with hairs to ca 0.4 mm long, rarely the entire awn essentially glabrous; callus 0.7–3 mm long with an acute (ours), usually curved, abaxially glabrous tip mostly 0.2–0.9 mm long; palea exposed at flowering, thin, about half as long as the lemma, blunt to acutish at the apex, hairy at least near the tip; anthers 2–4 mm long; $2n = 36, 44$. Chiefly in openings in sagebrush, mountain brush, pinyon-juniper, and aspen-spruce-fir, occasionally in ponderosa pine, lodgepole pine, and meadow communities or on exposed alpine ridges, at 1500 to 3350 m in all Utah counties except Kane and Piute; Alaska and western Canada, south through most of the western U. S., east to Texas; 258 (xviii). According to

Barkworth (pers. comm. 1986), the only phase of the species to enter our area is ssp. *nelsonii*, characterized by an acute rather than blunt callus. Hitchcock et al. (1969) treated the *S. occidentalis* complex, including *S. nelsonii* (as *S. columbiana*), as a single species. Barkworth et al. (1979) segregate *S. occidentalis* as a species distinct from the remainder of the complex in having the lower awn segment pubescent with hairs 1–2 mm long. Although Hitchcock (1951) reported *S. occidentalis* (in the sense of Barkworth et al.) from Utah, I have seen no plants in our area with awn pubescence longer than 0.5 mm. *Stipa nelsonii* is known to form hybrids with *S. hymenoides* (see *S. x bloomeri*) and also intergrades to some extent with *S. lettermanii* (q.v.). Nelson needlegrass is variable in palatability, but is usually rated high for cattle and horses on summer range (Valentine 1961).

Stipa neomexicana (Thurber) Scribn. New Mexico Feathergrass. [*S. pennata* var. *neomexicana* Thurber]. Tufted perennial, typically glaucous; culms 4–10 dm tall; sheaths glabrous or occasionally puberulent, rarely ciliate with longer hairs; blades involute-filiform, glabrous or puberulent; ligule of upper culm blades 0.5–3 mm long; panicle mostly 1–3 dm long, narrow; glumes ultimately membranous throughout or nearly so, subequal, (20) 30–60 mm long, long-tapered to sharply acute or hairlike tips, 5– to 7-nerved, glabrous; lemma at maturity brown and leathery, mostly 12–18 (19) mm long, sparsely short-hairy, the awn 120–220 mm long, once or occasionally twice geniculate, the lower segment(s) twisted and glabrous to minutely hairy, the longer upper segment densely pubescent throughout or nearly so with hairs mostly 1.5–3 mm long; callus to 6 mm long with a curved, sharply acute, abaxially glabrous tip to 1 mm long; palea similar to the lemma in length and texture, glabrous to sparsely hairy; $2n = 44$. Desert shrub and pinyon-juniper communities at 915 to 2000 m in Emery, Garfield, Kane, San Juan, Washington, and Wayne counties; Wyoming south to Arizona, New Mexico, and Texas, adventive in Oklahoma; 23 (0). Gould (1975) suggests that *S. neomexicana* may not be specifically distinct from *S. comata*. Indeed, the only distinction appears to lie in the awn indument: scabrous to puberulent in *S. comata* and densely pubescent with relatively long hairs in *S. neomexicana*. Moreover, the occurrence of intermediate specimens with awns short-hairy throughout is not uncommon. *Stipa neomexicana* is known to hybridize with *S. hymenoides* (see *S. x bloomeri*) and appears to intergrade with *S. comata* where their ranges overlap.

Stipa pinetorum Jones Pinewoods Needlegrass. Tufted perennial, often forming large circular clumps, usually glaucous; culms slender, 1–6 (8) dm tall; sheaths typically glabrous throughout, the old sheath bases terete, short, slender (mostly less than 1 mm wide), usually grayish, often inconspicuous; blades involute-filiform, typically less than 1 mm wide, smooth or scaberulous to puberulent; ligule 0.1–0.6 mm long; panicle sublinear to narrow, 0.5–2 dm long, the branches erect to slightly divergent; glumes ultimately membranous throughout or nearly so, equal or subequal, 7–12 mm long, long-tapered to sharply acute or hairlike tips, 1– to 3-nerved, glabrous or scaberulous; lemma at maturity papery and light brown, with membranous apical margins to ca 1 mm long, the body 3.5–5 (6) mm long, densely pubescent with hairs mostly 2.5–4 mm long, the length usually more or less uniform throughout, the awn 10–25 mm long, typically

twice geniculate, the two lower segments twisted, essentially glabrous or scaberulous to scabrid-puberulent; callus to ca 0.8 mm long, with a sharply acute abaxially glabrous tip to ca 0.3 mm long; palea at least 2/3 as long as the lemma, acute at the apex, pubescent like the lemma, the hairs at the tip exceeding the body of the lemma; anthers 1.5–3 mm long; $2n = 32$. Dry, often rocky slopes, shale barrens, and sagebrush, mountain brush, pinyon-juniper, and ponderosa pine communities at 2000 to 2900 m in Beaver, Daggett, Emery, Garfield (type locality), Juab, Millard, Sevier, Utah, Wasatch, Washington, and Wayne counties; Oregon east to Wyoming, south to California, Nevada, and Colorado; 22 (0). *Stipa pinetorum* is known to form hybrids with *S. hymenoides* (see *S. x bloomeri*).

Stipa speciosa Trin. & Rupr. Desert Needlegrass. Tufted perennial, the herbage typically glaucous; culms 3–6 (7.5) dm tall; sheaths firm, glabrous throughout or minutely hairy along the margins, especially near the summit, the old sheath bases persistent, forming a conspicuous feature; blades involute-filiform, mostly stiffly erect and pungent at the tips, smooth or scabrous; ligule of lower blades short, consisting chiefly of a ring of hairs, those of the uppermost blades typically membranous, 3–10 mm long, glabrous or variously hairy, often densely ciliate; panicle 0.7–2 dm long, narrow, the branches erect or strongly ascending; glumes ultimately membranous throughout or nearly so, equal or subequal, 14–25 mm long, long-tapered to sharply acute tips, glabrous or scaberulous, the first 1– to 3-nerved, the second 3– to 7-nerved; lemma at maturity brownish and firm, 7–10 mm long, more or less densely short-pubescent throughout or glabrate toward the apex, the awn 30–50 mm long, typically once geniculate, the lower segment twisted and densely pubescent with hairs 3–9 mm long, the terminal segment scaberulous and straight or nearly so; callus 1–2.5 mm long, with a curved, sharply acute, abaxially glabrous tip 0.5–1 mm long; palea thin, about half as long as the lemma, obtuse to acutish, glabrous; anthers 1.5–4 mm long; $2n = 60, 64, 66$. Joshua tree, desert shrub, sagebrush, and pinyon-juniper communities, and open, often rocky slopes, from 800 to 1900 m in Beaver, Emery, Garfield, Grand, Juab, Kane, Millard, San Juan, Tooele, Uintah, and Washington counties; southwestern U. S. and northern Mexico; South America; 102 (i). *Stipa speciosa* is known to form occasional hybrids with *S. hymenoides* (see *S. x bloomeri*).

Stipa thurberiana Piper Thurber Needlegrass. Tufted perennial, typically glaucous; culms slender, 1.5–6 (8) dm tall; sheaths glabrous or occasionally scabrous to puberulent below, not hairy at the summit; blades flexuous, involute-filiform, usually scabrous or soft-pubescent; ligule 2–7 mm long, glabrous or scaberulous on the abaxial surface; panicle mostly 0.5–1.5 dm long, narrow to somewhat open, the branches few flowered; glumes greenish or purple-tinged, ultimately membranous throughout or nearly so, equal or subequal, 8–16 mm long, long-tapered to sharply acute, often hairlike tips, 3 (5) -nerved, glabrous or nearly so; lemma pale, leathery at maturity, 6–8.7 mm long, sparsely short-hairy, often glabrate toward the apex, the awn 30–50 mm long, twice geniculate, the 2 lower segments twisted and pubescent with hairs 0.5–1.5 (2) mm long near the base and progressively shorter upward; callus to ca 1 mm long, the sharply acute, abaxially glabrous tip to ca 0.3 mm long; palea

subequal to the lemma, otherwise similar to it in texture and pubescence; anthers 2–4 mm long; $2n = 34$. Sagebrush, oak, and pinyon-juniper communities at 1650 to 1980 m in Box Elder and Juab counties; through much of the western U. S.; 5 (0). *Stipa thurberiana* is known to hybridize with *S. hymenoides* (see *S. x bloomeri*).

Stipa viridula Trin. Green Needlegrass. Tufted perennial; culms 5–11 dm tall; sheaths glabrous throughout or hairy along the margins and often at the summit, the old sheath bases persistent; blades flat to involute, 2–6 mm wide, smooth or scabrous; ligule 0.5–2 (3) mm long; panicle narrowly oblong, 1–2.5 dm long and to ca 2 cm wide, the branches erect or only slightly divergent; glumes ultimately membranous throughout or nearly so, equal or subequal, 8–13 mm long, long-tapered to sharply acute or hairlike tips, prominently 3 (5)–nerved, glabrous or the midnerve scaberulous; lemma at maturity brown and leathery, usually 5–6.5 mm long, the body narrowed toward the apex into a glabrate, whitish “neck” 0.5–1 mm long, sparsely appressed-pubescent below the “neck” and with a tuft of apical hairs generally less than 1 mm long, the apical margins not prolonged, the awn 20–35 mm long, mostly twice geniculate, the 2 lower segments twisted, subglabrous to scaberulous; callus to ca 1 mm long with a very short, blunt, glabrous tip; palea stiffly membranous, less than half as long as the lemma, acute to rounded at the apex, glabrous; anthers 2–3 mm long or vestigial and scarcely 1 mm long; $2n = 82, 88$. Along roads and in grass and sagebrush communities, at 1370 to 2150 m in Iron, Rich, Salt Lake, Sanpete, and Uintah counties; native to the Great Plains north of Kansas, introduced in Canada from British Columbia to Manitoba, south through the Rocky Mt. states; 8 (ii). *Stipa viridula* is known to hybridize with *S. hymenoides* (see *S. x bloomeri*). Green needlegrass is native to the northern and central Great Plains and is a fairly recent and infrequent introduction in Utah. The plant has been adapted for seeding on a wide range of soil textures, but does especially well on clayey and clay soils. It can survive in areas receiving as little as 25 cm mean annual precipitation (Thornburg 1982).

Tridens R. & S.

Perennials, rarely with short rhizomes; culms tufted; sheaths open; blades flat to involute; ligule a ring of hairs or a ciliate membrane; inflorescence an open to contracted panicle or raceme; spikelets mostly subcylindrical, 3– to 14-flowered, disarticulating above the glumes and between the florets; glumes subequal to unequal, the first 1–nerved, the second 1– to 3 (7)–nerved; lemma rounded on the back, mostly notched at the apex, 3–nerved, usually more or less pubescent below midlength; palea subequal to the lemma, often minutely hairy; stamens 3; caryopsis falling free of the lemma and palea, the embryo ca 2/5 as long as the grain; $x = 10$.

Tateoka, T. 1961. A biosystematic study of *Tridens* (Gramineae). Amer. J. Bot. 48: 565–573.

Tridens muticus (Torr.) Nash Slim Tridens. [*Tricuspidata* Torr.; *Triodia mutica* (Torr.) Scribu.]. Perennial; herbage often glaucous, glabrous or scaberulous to hairy; culms densely tufted, mostly 1.5–6.5 dm tall, erect; leaf blades flat or involute, 1–3 mm wide and mostly 3–25 cm long; ligule a ring of short hairs, sometimes membranous-based, the whole less than 1 mm long; panicle or raceme

sublinear to narrowly elongate, 4.5–20 cm long and mostly less than 1 cm wide, branches and pedicels erect or slightly divergent at flowering, the pedicels averaging much shorter than the spikelets; spikelets terete or nearly so, 5– to 11-flowered, (6) 7–12 (14) mm long, often purple-tinged; glumes lanceolate to elliptical, acute to obtuse at the apex, glabrous, the first 2–5 (6) mm long, 1–nerved, the second 4–6 mm long, 1 (3)–nerved, shorter than to nearly as long as the lowermost lemma; lemmas broadly elliptical to obovate, (3.5) 4.5–6 mm long, obtuse to rounded and usually shallowly notched and often mucronate at the apex, conspicuously 3–nerved, densely soft-hairy, the hairs to ca 1.5 mm long, appressed or spreading, and confined chiefly or entirely to the nerves from below to slightly above midlength; palea shorter and narrower than the lemma; anthers 0.3–2 mm long; $2n = 32–40$. Creosote bush, desert shrub, sagebrush, and pinyon-juniper communities at 610 to 1750 m in Beaver, Garfield, Millard, San Juan, and Washington counties; much of the southwestern U. S., the southern Great Plains and Texas, south to central Mexico; 29 (0). Slim tridens is palatable to all classes of livestock, but the plants are too scattered to be of significance as a source of forage.

Trisetum Pers.

Annuals or tufted perennials; sheaths open; blades mostly flat; ligule membranous; inflorescence a spike-like to open but usually narrow, more or less glistening panicle; spikelets narrowly oblong, flattened, (1) 2– to 3 (5)–flowered, the rachilla typically prolonged beyond the uppermost floret, conspicuously hairy, disarticulating above the glumes and between the florets or sometimes below the glumes; glumes lanceolate, equal or unequal, keeled, membranous-margined, acute at the apex, the first 1 (3)–nerved, the second 3 (5)–nerved and ranging from slightly shorter than the lowermost lemma to slightly longer than the uppermost one; lemma similar to or firmer than the glumes in texture, lanceolate to narrowly ovate, laterally compressed and keeled to ultimately rounded on the back, obscurely 5–nerved, sharply acute to narrowly rounded and entire or more often cleft at the membranous apex into 2 often bristlelike teeth, awnless or with an awn arising from above midlength on the back; callus minute, glabrous or short-bearded; palea membranous throughout, shorter to longer than the lemma; stamens 3; caryopsis free within the lemma and palea, fusiform, the embryo to ca 1/3 as long as the grain; $x = 7$.

1. Lemmas awnless or with awns to 2 mm long *T. wolfii*
- Lemmas with awns 3–14 mm long 2
- 2(1). Lemmas averaging at least 6 (6–8) mm long (including apical teeth), the awns averaging at least 7 (7–14) mm long; leaf blades 1–12 mm wide *T. canescens*
- Lemmas averaging less than 6 (3–6) mm long (including apical teeth), the awns averaging less than 7 (3–7) mm long; leaf blades 1–5 (6) mm wide 3
- 3(2). Panicles spike-like, compact or occasionally interrupted, the branches mostly less than 1 cm long (rarely the lowermost to 4 cm) and appressed to somewhat spreading *T. spicatum*
- Panicles loose, the branches 2–6 cm long and erect to spreading *T. montanum*

***Trisetum canescens* Buckley** Tall Trisetum. [*T. cernuum* var. *canescens* (Buckley) Beal; *T. cernuum* ssp. *canescens* (Buckley) Calder & Taylor]. Perennial; culms solitary or loosely tufted, (3) 5–12 (14) dm tall, erect or decumbent-based; sheaths long-hairy to occasionally merely scabrous; blades mostly flat, (1) 2–12 mm wide, long-tapered and involute at the finely acute tips, essentially smooth to long-hairy, often scabrous on the margins; ligule 1.5–5 mm long; panicle narrow but loose, (6) 8–25 cm long, erect to drooping, the rachis, branches, and pedicels glabrous or scaberulous; spikelets 1– or 2 (3) –flowered (the third floret often greatly reduced), (5) 7–10 mm long, the rachilla pubescent with hairs ca 1 mm long; glumes unequal, the first narrowly lanceolate, (3) 4–5 mm long, membranous except along the midnerve, long-tapered to a mostly aristate tip, the second broadly lanceolate, 4.5–7.5 mm long, membranous except along the 3 (5) nerves, acute to minutely aristate at the apex, consistently shorter than the lowermost floret; lemma at maturity slightly firmer than the glumes, scaberulous, 6–8 mm long including the bristlelike apical teeth, these mostly ca 1 mm long, the awn arising below the bifid apex, that of the first lemma (7) 8–14 mm long, typically twisted below and geniculate; callus bearded with hairs to ca 1 mm long; anthers 1.3–2.2 mm long; $2n = 28, 42$. Under maple, aspen, and spruce-fir, and on open slopes, from 1980 to 2440 m in Cache and Salt Lake counties; British Columbia and Alberta (as *T. cernuum* Trin.), south in much of the western U. S.; 9 (vi). *Trisetum cernuum* of Canada and the northwestern U. S. has a distribution similar to that of *T. canescens*, but differs morphologically chiefly in having shorter, apically erose second glumes to 4.5 mm long and shorter anthers to ca 1 mm long. The two elements occupy the same type of habitat and, where their ranges overlap, intermediate specimens are encountered. A number of contemporary authors, consequently, refer *T. canescens* to varietal status under *T. cernuum*.

***Trisetum montanum* Vasey** Rocky Mountain Trisetum. [*T. canescens* var. *montanum* (Vasey) A. S. Hitchc.]. *Trisetum montanum* is a puzzling element that has been allied with both *T. spicatum* (Cronquist et al. 1977) and *T. canescens* (Proc. Biol. Soc. Wash. 41: 160. 1928). The taxon as originally described (Bull. Torrey Bot. Club 13: 118. 1886), does appear to be intermediate between these two species, with spikelet morphology within the range of variation found in *T. spicatum* and the panicle loose with longer, spreading branches as in *T. canescens*. The distribution of specimens referable to *T. montanum* (Southwest) and of *T. canescens* (Northwest), however, militates against any theory that *T. montanum* is a product of hybridization. According to the original description, *T. montanum* differs from *T. spicatum* only in having panicles loose rather than spikelike. Occasionally, within populations of otherwise typical *T. spicatum*, however, plants with spreading branches as much as 4 cm long do occur. Although panicle branches for the species average much shorter in length, such plants, occurring as they do within populations of *T. spicatum* and differing in no other way, must be treated as being within the range of variation of that species. A few collections from the Abajo Mts. of Utah (e. g., Rydberg and Garrett 9861 UT), however, have spreading panicle branches that are mostly 2–6 cm long. These specimens appear to be anomalous *T. spicatum* plucked from a normal population

represented by collections of Rydberg and Garrett 9860 (UT). Unless additional information concerning these plants ultimately proves otherwise, their presence within populations of typical *T. spicatum*, the infrequency with which they occur, their similarity to *T. spicatum*, and the presence of intermediates suggest that they do not constitute a distinct species. *Trisetum montanum* has been reported from much of the southwestern U. S., but plants so identified usually prove to be loose-panicked *T. spicatum*.

***Trisetum spicatum* (L.) Richter** Spike Trisetum. [*Aira spicata* L.]. Perennial; culms solitary or tufted, (0.4) 1–8 dm tall; sheaths glabrous or short- to long-hairy, often densely so; blades flat or folded, 1–5 (6) mm wide, long-tapered and involute to prow-shaped at the tips, scabrous or puberulent to densely long-hairy; ligules 0.5–3 mm long; panicle spikelike or occasionally interrupted and somewhat loose, (2) 3–20 cm long, green and silvery to tawny or purple-tinged, the branches mostly less than 1 cm long or occasionally the lowermost to as much as 4 cm long, strictly appressed or occasionally somewhat spreading at flowering, the rachis, branches, and pedicels glabrous to densely pubescent; spikelets (1) 2 (3) –flowered, 4–7.5 mm long, the rachilla pubescent with hairs typically less than 1 mm long; glumes lanceolate, nearly equal to distinctly unequal, glabrous or hairy, the first 3–5 mm long, much narrower to nearly as broad as the second, membranous except along the midnerve, 1 (3) –nerved, acute to aristate at the apex, the second 4.5–6.2 mm long, broadly membranous-margined, 3 (5) –nerved, acute, slightly shorter than the lowermost floret to slightly longer than the upper one; lemma similar in texture to the glumes or at maturity slightly firmer, 3–6 mm long, glabrous or scaberulous, acute or bifid at the apex into bristlelike teeth to ca 1 mm long, the awn arising from the upper 1/3 of the back, that of the lower lemma 3–6 (7) mm long, straight or flexuous to geniculate, often widely spreading in age; callus glabrous or sparsely short-bearded; anthers 0.7–1.2 (1.5) mm long; $2n = 14, 28, 42$. Dry to wet sites, in aspen-spruce-fir, lodgepole pine, and meadow communities, and on exposed rocky slopes at higher elevations, occasionally in sagebrush and ponderosa pine communities, at 1830 to 4000 m in all Utah counties except Box Elder, Kane, and Weber; circumboreal, south throughout the western U. S., essentially absent from the Great Plains, sporadic in the Northeast and in Mexico; South America; Eurasia; 391 (xii). The widely distributed *T. spicatum* occupies a variety of climates and a wide range of habitats. On the premise that such plants “cannot be identical in all places,” Hulten (Svensk Bot. Tidskr. 53: 203–228. 1959) divided the species into 14 subspecies, 3 of which were reported as occurring in Utah. The races are, however, weakly differentiated, their ranges overlap, and their formal recognition serves no useful purpose. See *Koeleria macrantha* for discussion of a possible hybrid with *T. spicatum*. Spike trisetum provides good forage throughout its growing season and late into the fall. It seldom grows in dense stands, however, and is of only moderate importance as a source of forage (Valentine 1961).

***Trisetum wolfii* Vasey** Wolf Trisetum. Perennial, sometimes short-rhizomatous; culms solitary or tufted, mostly 2–10 dm tall; sheaths glabrous or rarely puberulent to sparsely long-hairy; blades flat, (1) 2–6 mm wide, long-tapered and involute to prow-shaped at the tips, essentially smooth or scabrous to rarely sparsely long-

hairy; ligule 1–3 mm long; panicle narrow, spikelike to interrupted or somewhat loose, erect, 4–16 cm long, the lowermost branches from very short to 6 cm or more long, the rachis and branches glabrous or scabrous; spikelets (1) 2- or 3 (4) -flowered, 4.2–8 mm long, the rachilla pubescent with hairs to ca 1 mm long; glumes equal or nearly so in length and usually in width, lanceolate to elliptical, (4.5) 5–8 (8.5) mm long, slightly shorter to longer than the lemmas, broadly membranous-margined, the margins often becoming tawny and to some degree purple, the apex abruptly to sharply acute, the first 1 (3) -nerved, the second 1- to 3-nerved; lemma at maturity usually slightly firmer than the glumes and scaberulous, 4–6 mm long, acute to blunt at the entire to minutely bifid apex, awnless or with an awn to 2 mm long arising below the tip; callus glabrous to minutely hairy; anthers 0.6–1.3 mm long. Aspen-spruce-fir and meadow communities at 2600 to 4000 m in Beaver, Daggett, Duchesne, Emery, Salt Lake, San Juan, Summit, Uintah, Utah, and Wasatch counties; southwestern Canada and throughout the western U. S.; 50 (iii).

Triticum L.

Annuals or biennials; culms erect; sheaths open, typically with well-developed auricles; blades mostly flat; ligule membranous; inflorescence a somewhat flattened, compact, terminal spike, the rachis continuous or disarticulating; spikelets sessile and solitary at each node, 2- to 5- (9) -flowered (the uppermost 1 or 2 usually neuter), disarticulating above the glumes and between the florets; glumes firm or rarely membranous, laterally compressed and more or less keeled, often asymmetrically so, equal or subequal, 3- to several-nerved, the apex truncate and mucronate to notched or with 1-several awns; lemma firm, broad, moderately compressed laterally and usually more or less keeled, with several nonconvergent nerves, abruptly acute to awned; stamens 3; caryopsis free-threshing, the embryo to about half as long as the grain; $x = 7$. See discussion of the tribe Triticeae under *Agropyron*.

Triticum aestivum L. Wheat. Annual; culms erect, often branched at the base, 3–15 dm tall; sheaths glabrous, the auricles typically well developed; blades flat, 2–16 (20) mm wide; ligule to ca 1 mm long; spike 3–18 cm long (excluding awns), stiffly erect to lax, the rachis continuous, the internodes glabrous, 4–8 mm long at about midlength of the spike; spikelets solitary at each node, subterete to moderately compressed; glumes firm, equal or subequal, lanceolate to ovate, 6–11 mm long, somewhat compressed laterally and keeled at least near the apex, usually asymmetrically so, truncate and mucronate to notched or awned, shorter than the lowermost florets; lemma firm, broad, 7–12 mm long, more or less asymmetrically compressed laterally, keeled to rounded on the back, acute or awn-tipped to awned, the awn 0.2–1.6 cm long; anthers to ca 3 mm long; $2n = 42$. Widely grown in Utah and often escaping; native to Eurasia, widely cultivated in temperate regions of the world. The numerous cultivars are variously treated as varieties or as distinct species. Surprisingly, Hanson (1972) reports that awnlessness in wheat is not compatible with maximum wheat production. Triticale (*x Triticosecale* Wittm.), an artificially produced hybrid between wheat and rye, has created considerable excitement in the world of agriculture, especially during the last twenty years. Although

much progress has been made toward production of a "manmade" cereal of commercial value, several serious problems remain to be solved before utilization of the hybrid can become widespread (*Advances in Genetics* 21: 256–345, 1982).

Zoysia Willd.

Low perennials, rhizomatous and stoloniferous; culms erect or ascending; sheaths open throughout or nearly so; blades short, stiffly spreading-ascending, often more or less pungently acute at the tips; ligule a short-ciliate membrane; inflorescence a slender, spikelike raceme or panicle to ca 4 cm long, the short-pedicelled spikelets appressed to the rachis; spikelets 1-flowered, laterally compressed, mostly 2–3 mm long, disarticulating below the glumes; first glume lacking, the second firm, soon becoming hardened, asymmetrically compressed, smooth and glossy, obscurely 1- to 3-nerved, acute or with an awn to ca 1.2 mm long; lemma membranous, broadly lanceolate, 1-nerved, with 2 rounded apical lobes; stamens 3, the anthers to 1.8 mm long; caryopsis free of the lemma and palea, the embryo 1/2 as long as the grain; $x = 10$. Three species of this Asian genus (including *Z. japonica* Steudel, *Z. matrella* (L.) Merr., and *Z. tenuifolia* Willd. ex Trin.) are known to have been introduced as lawn grasses into the warmer parts of the U. S., one as early as 1895. Cultivars derived from hybrids among the species have proved unsatisfactory when introduced in our area because they become straw colored or brown at first frost and do not green up until late in May. Moreover, once introduced, the cultivar is difficult to eradicate because of its rhizomatous nature.

HYDROCHARITACEAE A. L. Juss.

Frogbit Family

Plants herbaceous, submerged perennials; leaves opposite or whorled; flowers regular, dioecious or polygamous, mostly imperfect, sessile or on scapelike peduncles in a spathe; sepals mostly 3, valvate; petals 3 or lacking, imbricate; stamens mostly 3–9, free; anthers 2-loculed; stigmas 3–12; pistil 1, the ovary inferior, 1-loculed; fruit indehiscent; $x = 7-12$.

Elodea Michx.

A single genus with characteristics of the family.

- Upper leaves in whorls of 3, 6–13 mm long, the margins entire *E. canadensis*
- Leaves opposite, 16–32 mm long, the margins serrate *E. longicarinata*

Elodea canadensis Michx. [*Anacharis canadensis* Planchon; *Philotria canadensis* Britt.; *Udora canadensis* Nutt.]. Herbaceous aquatic perennial, 2–5 dm high; stems slender, sparsely branched; leaves whorled at least above (opposite below), linear-oblong, crowded, the blade 4–17 cm long, 1–2 mm wide, dark green, finely serrulate, apex rounded; flowers in the upper leaf axils; staminate perianth 4–5 mm long, remaining attached to the long pedicel; stamens 9; pistillate sepals 2–2.4 mm long; petals 2.5–3 mm long; fruit a capsule, 5–6 mm long; seeds 3–4, 4.5 mm long. In ponds, canals, reservoirs, and streams at 1370 to 2745 m in Beaver, Cache, Sevier,

Uintah, and Utah counties; Canada, south to California, Nevada, Arizona, New Mexico, Arkansas, Alaska, and North Carolina; 5 (0).

Elodea longivaginata St. John Herbaceous aquatic perennials; stems slender, little branched; leaves opposite (rarely in 3s), 16–32 mm long, 1–3 mm wide, acute or blunt apically, finely serrulate; staminate sepals 3.5–4 mm long, petals ca 5 mm long; stamens 9; pistillate sepals 2.5–3 mm long; staminodia 3, style slender, stigmas 3, not lobed; capsule 8–10 mm long; seeds usually 6, 5–6 mm long. In ponds, sloughs, and lakes at ca 2290 m in Wasatch County; Alberta and North Dakota, south to New Mexico; 1 (0).

IRIDACEAE A. L. Juss.

Iris Family

Perennial, from short rhizomes or corms; leaves narrow, distichous, with a sheathing base and equitant blade; flowers solitary or few to several, in terminal clusters, each subtended by a bract and typically all subtended by spathaceous bracts; perianth of 6 segments in 2 series of 3 each; stamens 3, the filaments often connate below into a tube; pistil 1, 3–carpellate, the ovary inferior; style 3–lobed, the branches sometimes again divided and petaloid; fruit a loculicidal capsule; x = 3–19+.

- 1. Plants lacking an aerial scape, blooming in autumn or early spring; flowers sessile on the corm that is several cm below ground level *Crocus*
- Plants with an aerial scape; flowers on elongate stems, not arising below ground 2
- 2(1). Flowers irregular or the perianth oblique and curved, secund; stamens usually disposed at one side ... *Gladiolus*
- Flowers regular, not curved or secund; stamens regularly disposed 3
- 3(2). Style branches large and petaloid; flowers usually over 5 cm wide; sepals and petals unlike *Iris*
- Style branches not petaloid; flowers less than 3 cm wide; sepals and petals alike *Sisyrinchium*

Crocus L.

Cormous herbs; leaves linear, grasslike; peduncles and ovary subterranean, the ovary subtended by colorless spathaceous bracts; flowers varicolored; perianth segments 6, subequal; stamens 3, not connate, inserted on the perianth tube, included; styles 3–branched; stigmas lacerate (or branched).

- 1. Corm scales reticulately fibrous; flowers white to lilac or purple; staminal filaments white *C. vernus*
- Corm scales with parallel fibers or smooth; flowers typically yellow (sometimes otherwise); staminal filaments various 2
- 2(1). Corm scales with parallel fibers *C. flavus*
- Corm scales smooth *C. chrysanthus*

Crocus chrysanthus (Herbert) Herbert Corm scales brownish to tan, smooth; bladeless sheaths 4 or 5 below ground; leaves of flowering stems 4–6, shorter to longer than the flowers; flowers typically yellow, the segments 2–4 cm long, often marked and veined with brown or purple; anthers with black sagittate bases; style branches lacerate. Commonly grown and long-persisting ornamental in much of Utah; introduced from Eurasia; 2 (0). This and other species of *Crocus* are among the earliest flower-

ing ornamentals, forming bright patches of color in the drabness of the late winter and early spring seasons.

Crocus flavus Weston [*C. aureus* J. G. Sm.]. Corm scales dark brown to brownish purple, with parallel fibers (at least ultimately); leaves of flowering stems 4–6, shorter to longer than the flowers; flowers typically yellow, the segments 2.5–4 cm long, sometimes marked or veined with darker colors; anthers with pale sagittate bases; style branches lacerate. Commonly cultivated ornamental, long-persisting in much of Utah; introduced from Eurasia; 2 (0).

Crocus vernus (L.) Hill Corm scales reticulately fibrous; leaves of flowering stems 4–6, shorter than or surpassing the flowers; flowers white, lilac, or purple, often marked with dark purple outside, the segments 2.5–7 cm long; anthers with yellow sagittate bases; style branches lacerate. Commonly grown ornamental in much of Utah, long persisting; introduced from Europe; 2 (0).

Gladiolus L.

Cormous herbs; stems leafy, swordlike; flowers sessile, secund, several to many, each subtended by a spathaceous bract, typically curved; perianth segments oblong to elliptic, unequal; stamens inserted below the throat; style slender; fruit a loculicidal capsule.

Gladiolus carneus Delaroché Plants to 1 m (or more) tall; stems slender, from corms 2–8 cm wide; leaves 1–4 dm long and 1–2.5 cm wide; flowers several to many, showy, variously colored, the segments 4–6 cm long. Commonly grown ornamental, occurring rarely as a waif, but frost sensitive and not persistent except by reintroduction, in much of Utah; widely grown in the U. S.; introduced from the Old World; 1 (i). Our material represents hybrid derivatives involving several species and the name applied here is only one of them. No inclusive binomial is available.

Iris L.

Rhizomatous herbs; leaves mainly basal, equitant, linear or swordlike; flowers showy, solitary or few to several, borne in 2-bracted spathes; perianth segments 6, dimorphic, the outer 3 (sepals or falls) usually spreading, sometimes bearded, the inner 3 (petals or standards) usually erect; stamens 3, the filaments not united, inserted at the base of the sepals; style branches 3, bifid or crested beyond the stigmas, petaloid, covering the stamens; fruit a capsule. Note: Many species and hybrids are grown as ornamentals in Utah, including *I. pumila* L., *I. reticulata* Bieb., *I. stolonifera* Maxim., *I. korolkowii* Regel, *I. variegata* L., their hybrids and other hybrid combinations. Those cited below are either indigenous or are known to occur spontaneously in our flora, the strictly cultivated ones are not treated.

- 1. Leaves 5 mm wide; rhizomes ca 5–10 mm thick; spathaceous bracts subopposite, 2–5 mm wide *I. pariensis*
- Leaves linear to swordlike, mainly 6–15 mm wide or more; rhizomes mostly more than 10 mm thick; spathaceous bracts alternate or opposite, mostly 5–20 mm wide or more 2
- 2(1). Spathaceous bracts opposite, mainly less than 12 mm wide; plants indigenous and widespread . *I. missouriensis*
- Spathaceous bracts alternate, typically more than 12 mm wide; plants introduced and persisting 3

- 3(2). Flowers pale yellow to almost orange; plants often more than 20 dm tall, growing in wet places . . . *I. pseudacorus*
- Flowers mainly purple, blue purple, or white; plants typically less than 10 dm tall, growing in gardens or dry places *I. germanica*

Iris germanica L. (hybrid). Flag; Fleur-de-lis. Rhizomes typically 20–30 mm thick, not especially clothed with leaf bases; leaves few to several, glaucous, 1.2–3.5 cm wide, 2–5 dm long, pale to stramineous basally; flower stems 4–8 dm tall, often branched; flowers 2 or 3 per spathe; spathaceous bracts alternate, scarious or partially herbaceous, lance-ovate to oblong, 15–25 mm wide, 2.5–7 cm long, erect or ascending; ovary 1–2 cm long; perianth tube 2–3 cm long; sepals 5–8 cm long, usually purple (violet), less commonly white; petals 5–8 cm long, often colored like the sepals; style branches 2.5–4.5 (5) cm long; style crests 10–15 mm long; anthers 14–18 mm long; 2n = 24, 36, 44, 48. Reclamation and ornamental plants, persisting and escaping in much of Utah; widely grown and established in the U. S.; introduced from Europe; 2 (i).

Iris missouriensis Nutt. Missouri Iris. Rhizomes typically 10–20 mm thick, clothed with brownish scaly bases; leaves glaucous, few to many, 0.6–7.5 dm long, 3–10 (12) mm wide, stramineous or brown basally; flower stems 2–8 dm tall, branched or simple, with 1–3 flowers; spathaceous bracts opposite, scarious or greenish, lanceolate to ovate, 2.5–7 cm long, 6–12 (15) mm wide; ovary 15–30 mm long; perianth tube 0.8–1.2 cm long; sepals 4–6 cm long, the blades obovate to ovate; pale lilac to whitish with purple veins; petals 4–5 cm long, oblanceolate, often more brightly colored than the sepals; style branches 1.5–2.5 cm long, the crests 5–8 mm long; anthers 10–15 mm long; capsules 3–6 cm long; 2n = 38. Moist meadows at 1430 to 2900 m in Box Elder, Carbon, Daggett, Duchesne, Garfield, Grand, Iron, San Juan, Tooele, Uintah, and Utah counties; British Columbia to North Dakota, south to New Mexico and California; 50 (iv).

Iris parisiensis Welsh Paria Iris. Rhizomes less than 10 cm thick, clothed with shredded fibrous leaf bases; leaves several to many on both fertile stems and innovations, 2–5 mm wide, (4) 7–24 cm long, stramineous to brownish or purplish basally; flower stem 4 cm tall, with several sheathing leaves free almost throughout; flower 1; spathaceous bracts linear-attenuate, 2–3 mm wide, 5–6 cm long, parallel, subopposite, herbaceous; ovary ca 12 mm long; perianth apparently white, the tube 15 mm long; sepals ca 6 cm long and 1 cm wide; petals narrowly oblanceolate, ca 6 cm long and 8 mm wide; style branches ca 2.8 cm long, the crests ca 7 mm long; anthers ca 13 mm long; capsule unknown. Grass-shrub community at 1400 m in Kane County; endemic; 1 (0).

Iris pseudacorus L. Yellow Flag. Rhizomes 20–30 mm thick or more; leaves few to several, linear, 2.5–9 dm long, mostly 10–20 mm wide, flowering stems 8–12 dm tall, leafy, usually branched, few- to several-flowered; flowers pale to deep yellow or almost orange, purple lined; perianth tube ca 12 mm long; sepals 4–6 cm long, obovate, the petals shorter and narrower; style branches 20–25 mm long, the crests ca 10 mm long; capsules 5–8 mm long; 2n = 24, 32, 34. Irrigation canal banks and pond margins at 1280 to 1315 m in Salt Lake County; eastern U. S.; introduced from Europe; 1 (0).

Sisyrinchium L.

Caespitose perennial herbs, seldom shortly rhizomatous; leaves equitant, sheathing at the base, the blade flattened and grasslike; stems simple or branched, flattened and wing-margined; spathes terminal or terminal on umbellately disposed rays from a primary (or secondary) foliose bract; flowers 1 or few, umbellate within the ultimate spathes, the pedicels usually further subtended by bractlets within the spathe; perianth rotate, the 6 segments alike, shortly connate basally, blue, rose purple, or white; staminal filaments connate basally and sometimes almost throughout; style branches slender; ovary 3-loculed; capsules loculicidally dehiscent.

- 1. Perianth typically rose purple, the segments 1.3–2.5 cm long or more; filaments united at the base; plants rare (in Tooele County) *S. douglasii*
- Perianth typically blue or purple (or white), less than 1.5 cm long; filaments united almost to the tips 2
- 2(1). Stems terminated by the paired spathes of mostly unequal bractlets; plants seldom of saline substrates *S. idahoense*
- Stems terminated by 2 or more umbellately disposed rays arising from within the sheathing base of a foliose bract, the rays each with a pair of subequal bractlets at the apex; plants often of saline substrates *S. demissum*

Sisyrinchium demissum Greene Blue-eyed Grass. [*S. radicum* Bicknell, type from St. George]. Caespitose, the stems erect, 0.7–4 dm tall or more, typically with a sheathing foliose bract subtending 2 or more umbellately disposed rays terminated by paired subequal to unequal spathes or rarely some of the rays again branched; leaves 1–32 cm long, 0.7–5 mm wide, entire or denticulate; rays 2–14 cm long; spathes paired, the outer mainly 11–22 mm long, connate at the base for 2.5–8 mm, the inner mainly 12–24 mm long; flowers 1–7 on glabrous or glandular-puberulent pedicels, these typically enclosed within the bracts; perianth pale to dark blue (or white) with a yellow center, the segments apiculate, 6–12 mm long; staminal filaments united for 3.5–5.5 mm; capsules globose to obovoid, 2.4–6.2 mm long; n = 16. Seeps, springs, wet meadows, and stream banks, often where saline, at 850 to 2380 m in Beaver, Carbon, Duchesne, Garfield, Juab, Kane, Millard, Piute, San Juan, Tooele, Uintah, Utah, and Washington counties; Nevada, Arizona, New Mexico, and Texas; Mexico; 40 (vii). All features regarded as diagnostic for this entity overlap with those of *S. idahoense* and it is not always possible to place a given specimen within either of the species with certainty.

Sisyrinchium douglasii A. Dietr. Purple-eyed Grass. [*S. grandiflorum* Dougl. ex Lindl., not Cav.]. Caespitose, the stems erect, 10–38 cm tall; leaves clasping basally, shorter than the stem, 1.8–4 mm wide, entire; spathes terminal on the stem, the bracts unequal, the inner 22–40 mm long or more, the outer 35–60 mm long or more, surpassing the flowers, these 1–4; pedicels subequal to the inner spathaceous bract; perianth rose purple, pink, or white, the segments 13–25 mm long, the segments apiculate; filaments connate in the basal half; anthers 3–9 mm long; style slender; capsules spherical to broadly obovoid, 5–10 mm long; n = 32. Gravelly north slope at ca 1585 m in Tooele County (Stockton Bar, Cotnam 7483 BRY); British Columbia to Idaho, California, and Nevada; 1 (0).

Sisyrinchium idahoense Bicknell [*S. occidentale* Bicknell; *S. segetum* Bicknell; *S. oreophilum* Bicknell]. Caespitose, the stems usually unbranched, mainly 1–5 dm tall; leaves 1–30 cm long, 1–3 (4.5) mm wide, entire or denticulate; spathe typically terminal, rarely borne on rays from a foliose sheathing bract, the spathaceous bracts usually unequal, the outer one 15–65 mm long and connate basally for 3–8 mm, the inner one 13–33 mm long; flowers 1–4; pedicels glabrous or glandular, shorter to longer than the outer bract; perianth blue to purple, commonly with a yellow center, the segments 6–15 mm long, apiculate; filament column 3–6.5 mm long; capsules 3–6 mm long, globose to ovoid; n = 32, 48. Seeps, springs, wet meadows and stream banks at 1310 to 2745 m in all Utah counties, except Carbon, Davis, Millard, Morgan, and Washington; British Columbia to Montana, south to Nevada and Colorado; 53 (v).

JUNCACEAE A. L. Juss.

Rush Family

Perennial or annual grasslike herbs; stems terete or flattened, not jointed, caespitose or arising singly or few together from rhizomes; leaves sheathing, alternate or all basal, mostly 2-ranked, the blades linear, sometimes much reduced or lacking; inflorescence headlike to open paniculate, subtended by an involucrel bract; branches, heads, and pedicels often subtended by bractlets; flowers perfect, sometimes subtended by bracteoles borne at pedicel apices, directly below the perianth; perianth segments 6, the petals and sepals essentially alike, membranous, rather scalelike, greenish or brownish; stamens (3) 6; pistil 1; ovary superior, with 1 or 3 locules; fruit a capsule; x = 3–36.

- 1. Seeds numerous in each capsule; leaves glabrous, the sheaths open; bracteoles subtending the flowers entire or lacking *Juncus*
- Seeds 3 per capsule; leaf blades pubescent at least on the margins near the base (except sometimes in *L. parviflora*), the sheaths closed; bracteoles subtending the flowers entire to lacerate *Luzula*

Juncus L.

Perennial or annual grasslike herbs; stems terete or flattened; leaf blades flat, strongly folded, or terete, when terete sometimes hollow with cross membranes at intervals (septae) or reduced to a bristle or lacking; flowers as described in the family; seeds numerous, minute, usually apiculate or tailed.

- 1. Plants annual 2
- Plants perennial 3
- 2(1). Plants 5–20 mm tall, the scapose stem with 1 flower; stamens 3; leaves not over 5 mm long *J. bryoides*
- Plants 2–30 cm tall, not scapose, the inflorescence with 1–20 flowers; stamens 6; leaves 0.5–10 cm long *J. bufonius*
- 3(1). Flowers (1) 2–5 in a solitary terminal head; leaves basal or nearly so, hollow, septate; plants densely tufted, without rhizomes, 3–19 cm tall, infrequent in the Uinta Mts. *J. triglumis*
- Flowers either more numerous or not in a solitary terminal head or plants otherwise different from above 4

- 4(3). Stems with 0–2 (rarely more) leaf blades; blades borne on the lower 1/5 of the plant, neither hollow nor septate; sheaths sometimes ending in a rudimentary bristle instead of a blade; flowers borne singly, each subtended by 2 hyaline bracteoles; rhizomes lacking or short and plants caespitose (except in *J. arcticus*) 5
- Stems with 2 or more well-developed leaf blades, at least the uppermost blade borne above the lower 1/3 of the plant or else hollow and septate; flowers borne in 1 or more heads and not individually subtended by bracteoles; plants mostly rhizomatous 13
- 5(4). Leaves all reduced to bladeless sheaths, the upper ones sometimes with a bristle-tip, this not over 5 mm long, inflorescence with 5–75 or more flowers; seed not tailed 6
- Leaves of most stems, at least the uppermost, with a well developed leaf blade well over 10 mm long or, if leaves all reduced to bladeless sheaths (*J. drummondii*), the inflorescence with only 1–3 flowers and seeds tailed 7
- 6(5). Involucrel bract subequal to or longer than the stem and the inflorescence appearing at or below the middle of the plant; stems seldom over 1 mm thick, somewhat tufted; plants of the Uinta Mts., above 2950 m, rather rare *J. filiformis*
- Involucrel bract mostly shorter than the stem and the inflorescence appearing above midlength of the plant; stems often over 1 mm thick, mostly arising singly or few together from robust dark rhizomes; plants widespread *J. arcticus*
- 7(5). Seeds tailed at each end, the tails from 1/2 to longer than the body; inflorescence with 1–6 flowers; stem leaves with blades lacking or reduced to a bristle, or the uppermost 1 (2) with a well-developed blade; plants mostly found above 2620 m 8
- Seeds apiculate but not tailed; inflorescence with (1) 6–50 or more flowers; stem leaves (at least some lower ones) commonly with well-developed blades; plants of various elevations 10
- 8(7). Stems with bladeless leaves, the uppermost and often the lower sheaths tipped with a bristle, this not over 1 cm long; tails of seeds equal to or longer than the body; perianth 5–8 mm long; capsules blunt and more or less retuse, equal or a little shorter than the perianth *J. drummondii*
- Most of the stems with a well-developed leaf blade on at least the uppermost sheath, the lower sheaths often tipped with a bristle; tails of seeds equal to or shorter than the body; perianth and capsule various 9
- 9(8). Capsules ovoid, retuse at the apex; perianth 4–5 (5.5) mm long; anthers less than 1 mm long, the filaments longer than the anthers *J. hallii*
- Capsules oblong, pointed; perianth 5–8 mm long; anthers 1.5–2 mm long, the filaments only ca 0.3 mm long *J. parryi*
- 10(7). Perianth segments, at least the outer ones, with incurved or hooded tips, rather obtuse, 1.5–2.5 mm long; uppermost leaf often borne above midlength of the stem 11
- Perianth segments with acute to acuminate erect tips, 3–5 mm long; uppermost leaf borne on the lower 1/3 of the stem 12
- 11(10). Anthers ca 3 times longer than the filaments; capsule ellipsoid-ovoid, equal to or slightly exceeding the perianth; plants sometimes over 40 cm tall, of Salt Lake County *J. gerardii*

- Anthers scarcely longer than the filaments; capsule globose-ovoid, distinctly exerted; plants 2–4 dm tall, known from floodplains of the Green and Colorado rivers *J. compressus*
- 12(10). Capsules retuse at the apex, completely 3-loculed; panicles mostly less than 2 cm long; perianth segments with hyaline margins extending to the apex of the acute tip; plants montane, mostly above 2350 m *J. confusus*
- Capsules blunt but not retuse, incompletely 3-loculed; panicles various but often over 2 cm long; perianth segments, at least the outer, with the hyaline margins not extending to the acuminate or acuminate-attenuate tip; plants found mostly below 2350 m *J. tenuis*
- 13(4). Flowers borne singly, each subtended by 2 bracteoles; pedicels sometimes also subtended by bractlets; perianth segments with incurved or hooded tips, 1.5–2.5 mm long 14
- Flowers borne in 1 to many heads, not subtended immediately by bracteoles, the pedicels usually subtended by bractlets; perianth segments, at least the outer, with erect or spreading tips, as short as or longer than above 15
- 14(13). Anthers ca 3 times longer than the filaments; capsule ellipsoid-ovoid, equal to or slightly exceeding the perianth; plants sometimes over 40 cm tall, of Salt Lake County *J. gerardii*
- Anthers scarcely longer than the filaments; capsule globose-ovoid, distinctly exerted; plants 20–40 cm tall, known from flood plains of the Green and Colorado rivers *J. compressus*
- 15(13). Leaf blades flat or strongly folded and appearing flat at least toward the base, neither terete nor hollow, the sheaths with hyaline margins; capsules not exerted beyond the perianth 16
- Leaf blades terete and hollow, if only toward the tip, the sheaths without hyaline margins and capsules conspicuously exerted beyond the perianth 18
- 16(15). Leaves strongly folded, the narrow edge oriented toward the flattened stem, the scarios margins of the sheaths extending well beyond the juncture with the stem, gradually tapering to inconspicuous auricles or the auricles lacking, the margins of the blade more or less united beyond the scarios margins ... *J. ensifolius*
- Leaf blades flat, the flat surface oriented toward the terete stem, the scarios margins of the sheaths not extending beyond the juncture with the stem 17
- 17(16). Seeds tailed, the tails as long as or longer than the body; perianth segments granular-papillate on the back; heads sometimes with more than 10 flowers; plants known from Duchesne, Salt Lake, and Wasatch counties *J. regelii*
- Seeds apiculate but not tailed; perianth segments smooth on the back; heads with 3–10 flowers; plants widespread *J. longistylis*
- 18(15). Leaf blades folded to enrolled toward the base, becoming terete and hollow distally, the sheaths without hyaline margins; auricles lacking; capsules conspicuously exceeding the perianth; seeds long-tailed, stamens 6; plants rare, from above timberline *J. castaneus*
- Leaf blades terete and hollow from the collar and outward, septate, the scarios margins of sheaths projected into auricles; capsules not much if any longer than the perianth and seeds not tailed or else the stamens 3; plants widespread 19
- 19(18). Seeds tailed; stamens 3; capsules conspicuously exceeding the perianth; plants known from Box Elder County *J. tweedii*
- Seeds not tailed; stamens 6; capsules various; plants widespread 20
- 20(19). Capsules tapered almost from the base into a mostly nondehiscent, conspicuous stylar beak, often divergent in all directions in the mature, globose or hemispheric head; heads rarely solitary, greenish or light brown; rhizomes sometimes swollen and tuberous at the nodes 21
- Capsules rather abruptly narrowed above into a dehiscent short or inconspicuous stylar bank, ascending to slightly spreading in the heads or, if spreading in all directions, the heads solitary; heads light or deep brown to blackish purple; rhizomes not as above ... 22
- 21(20). Auricles 1.5–5 mm long; perianth 4–5 mm long with rigid long-acuminate or subulate tips; mature heads 10–15 mm wide; capsules shorter or scarcely longer than the perianth; stems to 6 mm thick *J. torreyi*
- Auricles 0.2–1 mm long; perianth segments 2.5–3.5 mm long, acuminate, the tips not so rigid as above; mature heads 5–12 mm wide; capsules to ca 1 mm longer than the perianth; stems 1–2 mm thick *J. nodosus*
- 22(20). Perianth segments 3–5 mm long or, if smaller, the inflorescence with 1 or rarely 2 heads, equal to or conspicuously exceeding the capsules 23
- Perianth segments 1.5–2.8 mm long, shorter than the capsules; inflorescence with (1) 4–25 heads 24
- 23(22). Heads 1 or rarely 2, globose or nearly so, with 5–40 or more flowers; anthers 0.5–1 mm long, shorter than the filaments; perianth purplish black ... *J. mertensianus*
- Heads (1)2–13, not or hardly globose, with 3–13 flowers; anthers 1–2 mm long, longer than the filaments; perianth brown to purplish black ... *J. nevadensis*
- 24(22). Outer perianth segments obtuse, mostly longer than the inner ones; branches of the inflorescence stiffly erect; capsule rather abruptly rounded at the tip; plants of low elevations and montane *J. alpinus*
- Outer perianth segments acute, subequal to or shorter than the inner ones; capsules rather gradually tapering to the tip; branches of the inflorescence spreading to nearly divaricate; plants rather rare, apparently not montane *J. articulatus*

Juncus alpinus Vill. Northern Rush. Perennial rhizomes 5–40 cm tall; stems loosely tufted on creeping rhizomes, with 1–2 leaves mostly borne on the lower 1/3 or 1/2; leaves mostly with well-developed blades, the scarios margins of the sheaths prolonged into auricles, these 0.5–1 mm long, the blades terete, hollow, septate, 1–1.5 mm in diameter; involucre bract 1–7 (10) cm long, sometimes leaflike; inflorescence 0.8–8.5 cm long, rather openly branched, the branches mostly erect or strongly ascending, with (1) 3–25 small heads or headlike glomerules, the heads 3–4 (5) mm long, with 2–6 flowers; bractlets subtending the branches and heads scarios; pedicels obsolete or less than 1 mm long; bracteoles lacking; perianth 1.5–2.5 mm long, brownish to dark purple, the outer segments usually slightly longer than the usually more obtuse inner ones; stamens 6, the filaments ca 0.5 mm long, the anthers 0.2–0.5 mm long; styles with stigmas ca 1 mm long; capsules 1-loculed, 2.5–3 mm long, rather abruptly narrowed to a stylar beak to 0.3 mm long; $2n = 40$. Seeps, bogs, margins of lakes and ponds, and along streams, often on limestone or other

basic substrates at 1524 to 2800 m in Box Elder, Daggett, Duchesne, Garfield, Kane, Uintah, and Wayne counties; Alaska to Newfoundland and south to Washington, Colorado, and Quebec; 21 (vi). Some specimens are rather difficult to distinguish from those of *J. articulatus*.

Juncus arcticus Willd. Wiregrass [*J. balticus* Willd.; *J. balticus* var. *montanus* Engelm.; *J. balticus* var. *vallicola* Rydb.]. Perennial plants 2–10.5 dm tall; stems terete or slightly compressed, 1–5 mm in diameter, arising singly, 2–3 together, or rather tightly clustered, from robust dark brown or blackish rhizomes to 5 mm in diameter; leaves reduced to bladeless sheaths, the sheaths confined to the lower 1/5 of the plant, entire or occasionally tipped with a tiny bristle; involucre bract (2.5) 4–23 cm long, appearing as a continuation of the stem; inflorescence 0.5–15 cm long, congested and headlike with very few (ca 5) flowers to open-paniculate with up to 75 or more flowers; bractlets subtending the branches and pedicels scarious; pedicels nearly obsolete or to 8 mm long; bracteoles subtending the flowers ovate or nearly so, scarious; perianth segments 3.5–5 mm long, acute to acuminate, pale to dark brown, the outer ones often a little longer, more sharply pointed and with darker margins than the usually more rounded, often broadly scarious-margined inner ones; stamens 6, the filaments ca 0.5 mm, the anthers 1.4–2.1 mm long; styles and stigmas to ca 3 mm long; capsules 3–4 mm; seeds ca 0.6–0.8 mm long; $2n = 80, 84$. Margins of ponds and lakes, along streams and rivers, in saline to nonsaline meadows, seeps, springs, marshes, and swamps at 850 to 3050 m in all Utah counties, except Morgan; circumboreal, widespread in western North America, Eurasia; 150 (i). *Juncus arcticus* forms a highly variable complex. It seems best to await further monographic work for the disposition of infraspecific taxa.

Juncus articulatus L. Jointed Rush. Perennial plants 17–36 cm tall; stems loosely to rather densely tufted, from short stout or prolonged rootstocks, with 2–4 leaves, the upper leaf often on the upper 1/2–3/4 of the stem; leaves mostly bearing well-developed blades, the sheaths with scarious margins prolonged into auricles ca 1 mm long, the blades 0.5–2 mm wide, terete, septate; involucre bract 1–3.7 cm long; inflorescence 1.5–7 cm long, openly branched, the branches ascending to divaricate, with 4–25 small heads, the heads with (2) 5–10 flowers; bractlets subtending the branches and heads scarious; pedicels obsolete or less than 1 mm long; bracteoles lacking; perianth 2–2.8 mm long, mostly all acute, the segments equal or the inner ones slightly longer than the outer ones, greenish or purplish with conspicuous scarious margins, often minutely granular scabrous on the back; stamens 6, the filaments ca 0.5 mm long, the anthers 0.5–0.7 mm long; styles and stigmas ca 1 mm long; capsules 1-chambered, 2.8–3.8 mm long, gradually tapered to a styler beak to 0.3 mm long; seeds 0.4–0.5 mm long, apiculate. Along streams, sand bars of rivers, around ponds, and in wet lowland meadows at 1220 to 1710 m in Grand, San Juan, Tooele, and Utah counties; British Columbia to Newfoundland and south to Arizona and West Virginia; Eurasia; 5 (i).

Juncus bryoides F. Hermann Minute Rush. [*J. kelloggii* Engelm. misapplied]. Annual plants ca 0.5–2 cm tall, the scapose stems capillary, 0.1–0.2 mm thick; leaves basal or nearly so, mostly less than 1/2 as long as the stems, flat or channeled, with scarious margins, not over 1

mm wide; inflorescence a solitary terminal flower, this subtended by mostly 2 scarious bracteoles; perianth segments 1.5–2 mm long, acute, about equal; stamens 3, the filaments ca 0.4 mm long, the anthers ca 0.2 mm long; capsules shorter than the perianth; seeds 0.3–0.4 mm long, obscurely apiculate. Ponderosa pine, aspen, and mountain brush communities apparently mostly on moist or spring-fed sandy soil or sandstone or quartzite at 2400 to 2550 m in Daggett, Salt Lake, Sevier, and Uintah counties; California to western Colorado; 5 (0). This very small plant is easily overlooked, it is probably more widespread than the few collections indicate.

Juncus bufonius L. Toad Rush. [*J. bufonius* var. *occidentalis* F. Hermann; *J. sphaerocarpus* misapplied]. Tufted annual plants, 2–30 cm tall, from few to numerous fibrous roots; stems few to many; leaves basal and cauline or all basal in very small plants, some of the basal ones bladeless, margins of sheaths hyaline but not projected into auricles, the blades 0.2–1 mm wide, involute or channeled; involucre bract to 3.5 cm long, filiform and leaflike, or scarious, much reduced and hardly different from the bracteoles in very small plants; inflorescence 0.6–12 cm long, often 1/4–4/5 the height of the plant, with 1–20 flowers, the flowers borne singly and sometimes rather remote; bractlets of the nodes scarious, often aristate; pedicels obsolete or less than 1 mm long; bracteoles subtending the flowers scarious, usually ovate; perianth segments 3–6 (8) mm, lanceolate, acute to acuminate, the inner ones shorter than and not as pointed as the outer; stamens 6, the filaments 0.7–1 mm long, the anthers 0.3–0.8 mm long; styles less than 1 mm long; capsules incompletely 3-loculed, 3–4 mm long, ca 1/2 as long to nearly equaling the perianth, subglobose to cylindrical-ovoid; seeds 0.3–0.5 mm long, scarcely apiculate; $2n = 34, 54?, 70, 80, 100–110, 160$. Moist or wet soil of rocky drainages, ephemeral pools, along streams and rivers, margins of ponds and lakes, hanging gardens, and wet meadows, in many plant communities at 1135 to 2850 m in all Utah counties, except Iron; cosmopolitan except in the tropics and extreme arctic; 93 (viii).

Juncus castaneus J. E. Sm. Chestnut Rush. Perennial plants, stems arising singly or 2 together from slender, rather long rhizomes, 7–22 cm tall; leaves extending up to the upper 1/3–4/5 of the stem, the sheaths without hyaline margins, lacking auricles, the blades strongly folded below, becoming channeled toward the middle and terete, hollow, and septate toward the tip; involucre bract 1.5–3.5 cm long, scarious and broadly expanded below, prolonged into an involute tip; inflorescence 1–7 cm long, of 1–4 compact heads, the heads ca 5–10 flowered, bractlets subtending the pedicels scarious like the involucre bract but not with a prolonged involute tip; pedicels 2–4 mm long; bracteoles subtending the flowers lacking; perianth segments 4–7 mm long at anthesis, linear-lanceolate, acute or the inner ones somewhat obtuse, chestnut colored or purplish brown; stamens 6, ca 1 mm shorter than the perianth at late anthesis, the filaments ca 3 mm long, the anthers ca 1 mm long; styles ca 2–3 mm long; capsules 1-loculed, 6–10 mm long, elongate, much exceeding the perianth, very gradually tapering into a styler beak ca 1 mm long; seeds 2.5–4 mm long, strongly tailed, the tails longer than the body; $2n = 60$. Wet alpine communities in the Wasatch Plateau and Uinta Mts. in Sanpete and Summit counties; circumboreal and south in mountains of western North America to

New Mexico; 2 (i). The leaf blades are folded toward the base and are thus similar to those of *J. ensifolius*, but the sheaths are without the scarios margins that are so prominent in those of *J. ensifolius*.

***Juncus compressus* Jacq.** Caespitose perennial plants from thickened short rootstocks and fibrous roots, 20–40 (60) cm tall; leaves on the lower 1/2 of or extending well up on the stems, the scarios margins of sheaths terminating in scarios aricles, the blades 0.5–1.2 mm wide, more or less channeled; involucre bract 2–15 cm long, leaflike; inflorescence 3–15 cm long, congested to open paniculate, with ca 12–80 flowers, these borne singly; bractlets subtending the branches of the inflorescence similar to but smaller than the involucre bract, or the upper ones scarios and much reduced; pedicels obsolete or to 3 mm long, bracteoles of the flowers scarios, rounded to broadly acute; perianth segments 1.5–2.2 mm long, slightly coriaceous and incurved at the tip, especially the outer set; stamens with filaments ca 1 mm long, and anthers ca 0.5–0.7 mm long; styles ca 1 mm long; capsules 2–2.5 mm long, subglobose, obtuse, exceeding the perianth; seeds ca 0.4 mm long, apiculate at both ends. Sand bars, mud flats, swamps, and riparian communities along the flood plain of the Green and Colorado rivers at 1220 to 1675 m in Daggett, Emery, Grand, and Uintah counties; Montana to Utah and east to Nova Scotia, and Eurasia, most likely introduced in the western U. S. and probably in the East; 8 (i).

***Juncus confusus* Cov.** Densely caespitose, perennial plants from fibrous roots, 8–52 cm tall; leaves basal or borne on the lower 1/4 of the stems, the upper 2–4 with well-developed blades, these 0.5–1.3 mm wide, mostly narrower than the stems, channeled or involute, the hyaline margins of the sheaths projected into rounded auricles; involucre bract 1–13 cm long, less than 1 mm wide, very slender, with a scarios decurrent auricle; inflorescence 0.8–2 cm long, with (1) 3–40 flowers, congested, but the flowers borne singly and not in heads; bractlets subtending the pedicels scarios or the lowest one similar to but much smaller than the involucre bract; pedicels nearly obsolete or to ca 2 mm long; bracteoles 2, or these subtended by additional smaller ones borne on the pedicel; perianth segments 3–5 mm long, elliptic-lanceolate or lanceolate, acute to broadly acute, with conspicuous hyaline margins extending to the tip, subequal or the inner set slightly shorter; stamens to ca 1.7 mm long, the anthers 0.5–0.6 mm long; styles ca 1 mm long; capsules 3-loculed, 3–4 mm long, subequal to the perianth, retuse at the apex; body of seeds ca 0.4 mm long, more or less blunt at the apex with a bent apiculate tip from one side. Ponderosa pine, aspen, lodgepole pine, Engelmann spruce, dry and wet meadow, and willow communities at 2070 to 3110 m in Box Elder, Cache, Daggett, Duchesne, Garfield, Iron, Juab, Morgan, Salt Lake, Sanpete, Sevier, Summit, Uintah, Utah, Wasatch, and Washington counties; British Columbia to Saskatchewan and south to California and New Mexico; 50 (xv).

***Juncus drummondii* E. Mey. in Ledeb.** Densely caespitose perennial plants from fibrous roots, 8–40 cm tall; stems terete; leaves mostly on the lower 1/4 of the stem, reduced to sheaths or the upper most sheath mostly with a bristle-tip (much reduced blade), this 1–10 mm long or rarely longer, the upper sheath slightly bilobed and scarios at the apex; involucre bract 1–4 cm long, shorter than or exceeding the inflorescence by 2 cm, terete, with

scarios decurrent auricles; inflorescence 0.8–2 (3) cm long, with (1) 2 or 3 flowers, the flowers borne separately on pedicels 1–15 (20) mm long, the pedicels often subtended by and partly enveloped in scarios bractlets, the lowest bractlet sometimes similar to but shorter than the involucre bract, each flower subtended by 2 scarios bracteoles 2–4 mm long, these rounded to broadly acute; perianth segments 5–8 mm long, equal or the outer set slightly longer, narrowly acute; stamens ca 2 mm long, the anthers ca 2–3 times longer than the filaments; styles ca 2 mm long; capsules 3-loculed, 5–7 mm long, ca as long or a little shorter than the sepals, retuse at the tip; body of seeds ca 1.5–2 mm long, appendaged on both ends, the appendages as long or slightly longer than the body. Lodgepole pine, spruce-fir, wet and dry meadow, and alpine communities, in wet to dry rocky places at 2940 to 3475 m in Box Elder, Daggett, Duchesne, Garfield, Grand, Juab, Piute, Salt Lake, Sevier, Summit, Uintah, Utah, and Wasatch counties; Alaska to New Mexico; 76 (iv).

***Juncus ensifolius* Wikstrom** Swordleaf Rush. Perennial plants 21–72 cm tall; stems flattened, arising singly or loosely to rather densely tufted, from creeping rhizomes; leaves clustered on the lower 1/2 of the stems, but the upper one usually borne near or above midlength of the stem, strongly folded and flattened, the narrow ventral edge facing the stem, the broad scarios margins of the sheaths extending onto the blade, hardly if at all projected into auricles, the blades more or less closed above the scarios margin, partly to completely septate in the closed position; involucre bract much reduced to leaflike and up to 5 cm long, but shorter than the inflorescence, this 1–17 cm long, with (2) 3–90 or perhaps more heads, the heads light green to nearly black, with 4–25 flowers; bractlets subtending the heads and pedicels scarios; pedicels to ca 1 mm long; bracteoles lacking; perianth segments 2.3–4 mm long, the inner ones slightly shorter and slightly less pointed than the acute outer ones; stamens 3 or 6, filaments ca equal the anthers, these 0.4–1.3 (1.5) mm long, styles 0.5–1.5 mm long; capsules 3-loculed, rounded toward the tip, equal or a little longer than the perianth, the body of the seeds 0.4–0.6 mm long, with or without tailed appendages to 0.2 mm long at either end. There are three varieties as follows:

1. Stamens 3; plants rare in Utah *J. ensifolius* var. *ensifolius*
- Stamens 6; plants common 2
- 2(1). Heads (5) 10–60 (90) or perhaps more, mostly 3–8 mm thick, with ca 4–12 flowers; seeds with apiculate tails, or the tails rarely lacking (in Utah specimens); plants common in the Canyonlands section of the state, and wholly intergrading into the following variety throughout much of the state *J. ensifolius* var. *brunnescens*
- Heads 2–10 or rarely more, mostly 8–15 mm thick, with ca 10–15 (25) flowers; seeds with or without apiculate tails; plants state wide and over a wide elevational range, but more common in mountains and in the Great Basin than the preceding variety *J. ensifolius* var. *montanus*

Var. *brunnescens* (Rydb.) Cronq. [*J. brunnescens* Rydb.; *J. saximontanus* f. *brunnescens* (Rydb) F. Hermann; *J. tracyi* Rydb., type from Ogden; *J. tracyi* f. *utahensis* (Martin) F. Hermann; *J. utahensis* Martin, type from Ashley National Forest, Summit (?) County]. Along rivers, streams, ditchbanks, around seeps, springs,

ponds, lakes, and in hanging gardens, marshes, meadows, and bogs at 1065 to 2450 (2740) m in Beaver, Duchesne, Emery, Garfield, Grand, Iron, Kane, Rich, San Juan, Sanpete, Sevier, Summit, Uintah, Utah, Washington, and Wayne counties, and intergrading into var. *montanus* in nearly all counties of the state; nearly throughout the range of var. *montanus*, but more common southward especially in Arizona and the only phase in Texas; 145 (v). See discussion under var. *montanus*.

Var. *ensifolius* Wet places in mountains in Daggett, Salt Lake, Tooele, and Uintah counties; Alaska to northern Mexico and east to Alberta and Arizona, 4 (i). The few specimens from isolated stations in Utah with only 3 stamens per flower could be nothing more than odd specimens of var. *montanus*. However, to the north of our area this is a common phase.

Var. *montanus* (Engelm.) C. L. Hitchc. [*J. xiphioides* var. *montanus* Engelm.; *J. saximontanus* A. Nels.]. In meadows, along streams and rivers, about seeps and springs and other wet places at (853) 1830 to 3100 m in all counties of the state; Alaska to southern California and east to Saskatchewan and New Mexico; 128 (v). A study of the numerous specimens from Utah revealed the following trends: 1) Most plants of the lower elevations in southeastern Utah are rather easily assigned to var. *brunnescens* (they mostly have apiculate-tailed seeds); 2) Plants of the Great Basin are often referable to var. *montanus* (they have apiculate but rarely tailed seeds); and 3) Throughout the plateaus and mountains of central Utah and the Uinta Mts., there are plants of both varieties and numerous intermediate plants (seeds are commonly with or without tails in both varieties as well as in intermediate plants). Color phases of the inflorescence (pale green to purplish black) are also found in both varieties and in intermediate plants. Perhaps outside Utah, the situation is not so complex, but this seems to be where the two varieties overlap. More than a quarter of the specimens examined appear to be intermediate.

Juncus filiformis L. Plants perennial, 5–40 cm tall; stems arising singly or in tufts from creeping rhizomes, terete, rarely over 1 mm in diameter; leaves reduced to bladeless sheaths, the uppermost one often tipped with a tiny bristle, confined to the lower 1/5 of the plant; involucre bract 10–27 cm long, appearing as a continuation of the stem, as long as or to over 4 times longer than the stem; inflorescence appearing lateral and on the lower 1/2–1/10 of the plant, 0.5–1 (2) cm long, compact, with ca 5–20 flowers, the flowers borne singly; bractlets subtending the branches and pedicels scarious, the lower ones sometimes aristate; pedicels nearly obsolete or to 4 mm long; bracteoles scarious, ovate or oblong; perianth segments 3–4.5 mm long, greenish, lanceolate, acute to acuminate, subequal or the outer ones slightly longer; stamens 6, the filaments ca 0.6 mm, the anthers 0.4–0.6 mm long; styles and stigmas less than 1 mm long; capsules 3-loculed, ca 2–3 mm long, greenish, ovoid to obovoid, abruptly tapered to a very short stylar beak; seeds 0.4–0.6 mm long, minutely winged-apiculate at both ends; $2n = 70, 80, 84$. Wet subalpine meadows and along streams in the Uinta Mts. at 2990 to 3200 m in Summit, Uintah, and Wasatch counties; Alaska to Labrador and south to Utah and West Virginia; 10 (iv).

Juncus gerardii Lois. Black Grass; Mud Rush. Perennial plants 15–80 cm tall; stems somewhat tufted on slender dark rhizomes; leaves rather scattered on the stems,

the upper one usually borne on the upper 1/2 of the stem, the lower ones bladeless or with reduced blades, the upper blades flat, 1.5–3 mm wide; inflorescence with several to many flowers, the flowers borne singly and subtended by scarious bracteoles, nearly sessile to long-pedicelled; perianth segments 2–3.5 mm long, dark brown with a greenish midstripe, blunt and usually hooded at the tip; stamens 6, the anthers ca 1.5 mm long, ca 2–3 times longer than the filaments; capsules ovoid to obovoid, rounded, subequal to but a little shorter than the perianth; seeds 0.5–0.6 mm long, slightly apiculate at the tapered end, nearly truncate-apiculate at the other end. Becks Hot Spring in Salt Lake County (Flowers sn 24 Sept. 1924 UT); Atlantic and Pacific coasts, sporadic inland; Eurasia; 1 (0). The Salt Lake County population is probably eradicated, since the area is now part of Interstate 15.

Juncus hallii Engelm. Halls Rush. Perennial caespitose plants 20–40 cm tall, from fibrous roots, rhizomes lacking; stems terete, to ca 1.5 mm thick; leaves basal and on the lower 1/5 of the plant, usually only the uppermost cauline leaf bearing a well-developed blade, the lower stem leaves bladeless or tipped with a short bristle, the innovations sometimes with well-developed blades, the blades terete, the upper side more or less channeled toward the base, not or very inconspicuously channeled toward the tip, less than 1 mm wide; involucre bract 0.7–2.5 (7.5) cm long, scarious and caudate to awned, or elongate and leaflike with scarious margins projected into auricles; inflorescence to 1.7 cm long, with (2) 3–6 flowers, the flowers rather congested, but borne singly; bractlets subtending the pedicels scarious, attenuate to caudate; pedicels 1–8 mm long; bracteoles subtending the flowers hyaline, ovate to nearly orbicular; perianth segments 4–5 (5.5) mm long, subequal or the inner ones a little shorter, lanceolate, acute, usually with greenish centers flanked by purple and with hyaline margins; stamens 6, the filaments 1–1.5 mm long, the anthers 0.5–0.7 mm long; styles and stigmas not over 1 mm long; capsules 3-loculed, equaling or ca 1 mm longer than the perianth, triquetrous, retuse at the apex, dark brown to purplish black; body of the seeds 0.6–0.7 mm long, tailed at each end, the tails ca 1/2 as long as the body. Dry, wet, and boggy meadows, margins of ponds and lakes, and along streams at 2956 to 3350 m in Beaver, Daggett, Duchesne, Garfield, Summit, Uintah, and Wasatch counties; Montana to Colorado; 13 (xi).

Juncus longistylis Torr. in Emory Longstyle Rush. Perennial plants 20–63 cm tall; stems arising singly or few together from creeping rhizomes, terete; leaves somewhat crowded on the lower 1/2 of the stem, but the uppermost one often on the upper 1/2–3/4 of the stem, the scarious margins of the sheaths prolonged into auricles to ca 1 mm long, the blades flat, not hollow, not septate, 1–3 mm wide; involucre bract 1–4 cm long, ca equaling or shorter than the inflorescence, mostly scarious, rarely leaflike, narrowly attenuate to caudate; inflorescence 1–7.5 cm long, usually with (1) 3–13 heads, the heads with 3–10 flowers; bractlets subtending the heads and pedicels scarious, acute to caudate; pedicels to ca 2 mm long, concealed in the scarious bractlets; perianth segments (4) 5–6 mm long, acute to acuminate, often purplish with greenish center and broad whitish or silvery hyaline margins; stamens 6, the filaments 0.5–1 mm long, the anthers (1) 1.3–2 mm long; styles 1–2 mm long;

stigmas ca 2 mm long; capsules 3-loculed, shorter than or rarely equaling the perianth, rather abrupt to retuse at the stylar beak, brownish or purplish black; seeds ca 0.5 mm long, apiculate at each end; $2n = 40$. Wet meadows, along streams and rivers, about seeps and springs and other wet places, occasionally in saline places at 1380 to 3350 m in Box Elder, Cache, Daggett, Duchesne, Emery, Garfield, Grand, Kane, Millard, Morgan, Salt Lake, San Juan, Sanpete, Sevier, Summit, Tooele, Uintah, Utah, Wasatch, Washington and Wayne counties; southern Canada, Washington to South Dakota and south to California and New Mexico; 100 (viii).

Juncus mertensianus Bong. Mertens Rush. Perennial plants 13-42 cm tall; stems arising singly or loosely to tightly clustered on long creeping or short rhizomes, the rhizomes sometimes very short and stout and plants caespitose with numerous fibrous roots; leaves basal and on the upper 1/4-3/4 or higher on the stems, scarios margins of the sheaths projected into ligulelike auricles 0.5-2 mm long; blades terete, channeled above, hollow, septate, 0.5-2 mm wide when pressed; involucre bract 0.8-3.2 cm long, rarely leaflike, often caudate; inflorescence 0.5-1.5 (3.5) cm long, with 1 (2) head(s), the heads with 5-40 or more flowers, to ca 1.5 cm thick; bractlets subtending the heads and pedicels scarios, acute to caudate; pedicels to ca 1 mm long; bracteoles lacking; perianth segments 2.5-4 mm long, acute to acuminate, blackish purple; stamens 6, filaments 1-1.3 mm long, anthers 0.5-1 mm long, shorter than the filaments; styles to 1 mm long; stigmas to 1 mm long; capsules 1-chambered, triquetrous, slightly to conspicuously shorter than the perianth, abruptly tapered to or slightly retuse at the stylar beak, often as blackish purple as the perianth; seeds 0.5-0.7 mm long, apiculate but hardly tailed; $2n = 20, 40$. Wet meadows, along streams, about seeps and springs, margins of lakes and ponds, and Engelmann spruce- lodgepole pine, and tundra communities at 2435 to 3415 m in Box Elder, Cache, Duchesne, Garfield, Iron, Juab, Piute, Salt Lake, San Juan, Sanpete, Sevier, Summit, Uintah, Utah, and Wasatch counties; Alaska and Yukon south to southern California and South Dakota; 83 (vi).

Juncus nevadensis Wats. Nevada Rush. [*J. badius* Saksd.]. Perennial plants 12-35 (53) cm tall; stems more or less terete, arising singly or a few together from creeping rhizomes; leaves basal and on the upper 1/4-3/4 or higher on the stems, with well-developed blades, the scarios margins of the sheaths projected into ligulelike auricles 1.5-3 mm long, blades terete, hollow, septate, somewhat channeled above, 0.5-2 mm wide; involucre bract 1-3 (8.5) cm long, bractlike to leaflike, seldom much exceeding the inflorescence; inflorescence 1-8 cm long, with (1) 2-13 heads, the heads with (3) 6-13 or more flowers; bractlets subtending the heads membranous, attenuate to caudate; pedicels to ca 1 mm long; bracteoles lacking; perianth segments (3) 3.5-5 mm long, brown to purplish black; anthers 1-2 mm long, longer than the filaments; styles to 3 mm long, the stigmas 1-2 mm long; capsules 1-loculed, equal to or conspicuously shorter than the perianth, triquetrous, rounded or rarely slightly retuse at the apex; seeds 0.5-0.6 mm long, apiculate but not tailed. Dry meadow, wet meadow, silver sagebrush-meadow, and lodgepole pine communities at 2286 to 3050 m in Box Elder, Cache, Daggett, Duchesne, Emery, Garfield, Grand, Kane, Rich, Sanpete, Summit, Uintah,

Wasatch, and Washington counties; southern British Columbia and Alberta south to California and New Mexico; 43 (xvii). The inflorescence is sometimes similar to those of *J. ensifolius* and *J. longistylis*, and plants of these taxa are sometimes confused. The leaves are different in each of these. Occasional plants with only 1 or 2 heads are rather easily mistaken for those of *J. mertensianus*.

Juncus nodosus L. Jointed Rush. Perennial plants 17-58 cm tall; stems terete, 1-2 mm thick, arising singly to densely clustered on creeping rhizomes, the rhizomes sometimes with small tuberlike segments; leaves usually extending well up the stems, those of the stem with well-developed blades, those of the innovations often with blades, the scarios margins of the sheaths prolonged into very short auricles 0.3-1 mm long, the blades terete or channeled above, hollow, septate, 0.5-1.5 mm wide when pressed; involucre bract 2.5-12 cm long, more or less leaflike; inflorescence 1.5-7 cm long, congested or rather open, with 3-12 globose or nearly globose heads, the heads sessile or pedunculate, with (5) 10-25 flowers, 5-12 mm wide, the flowers widely spreading to divergent; bractlets subtending the heads scarios, acute to cuspidate; pedicels to ca 1 mm long; perianth segments 2.5-3.5 mm long, subequal, acuminate, the acuminate tips shorter than and not so rigid as in those of *J. torreyi*; stamens 6, the filaments ca 0.8 mm long, the anthers 0.6-0.8 mm long; styles to about 3 mm long, the stigmas ca 1 mm long; capsules incompletely 3-loculed, to ca 1 mm longer than the perianth, slender, gradually prolonged into a tardily dehiscent stylar beak, sharply triangular in cross section; seeds 0.4-0.5 mm long, apiculate. Wetlands along streams and rivers and in wet and boggy meadows at (1250) 1640 to 2320 m in Cache, Duchesne, Garfield, Piute, Rich, Summit, Uintah, Washington, and Wayne counties; southern Canada and northern U. S., south to California and Texas; 36 (xiii).

Juncus parryi Engelm. Parry Rush. Perennial caespitose plants (10) 15-30 cm tall, from fibrous roots, lacking rhizomes; stems terete, about 1 mm thick; leaves basal and borne on the lower 1/5 of the stems, usually only the uppermost one with a well-developed blade, the lower sheaths usually tipped with a bristle or much reduced blade, and the uppermost one sometimes reduced on a few of the stems, the scarios margins of the sheaths barely prolonged into auricles less than 0.5 mm long, the blades less than 1 mm thick, terete, channeled to strongly involute below, obscurely channeled above, not septate; involucre bract 1.5-6 (9) cm long, leaflike, terete, more or less simulating a continuation of the stem, often auriculate; inflorescence 0.7-2.2 cm long, with 1-4 flowers, the flowers borne singly; bractlets subtending the pedicels scarios, acute to caudate, or one of them often similar to the involucre bract but smaller; pedicels 1-20 mm long, the abaxial ones often much longer than the adaxial; bracteoles subtending the flowers ovate to lance-ovate, rounded to acute or acuminate-attenuate; perianth segments 5-8 mm long, the inner ones to 1 mm shorter than the outer and somewhat less pointed and more scarios; stamens 6, the filaments ca 0.3 mm long, anthers 1.5-2 mm long; styles ca 1.5 mm long, stigmas to 3.5 mm long; capsules a little shorter to a little longer than the perianth; body of seeds 0.6-0.7 mm long, with tails a little shorter than or to 0.1 mm longer than the body. Engelmann spruce, lodgepole pine, meadow, and alpine communities, on wet to dry rocky ground, sometimes in rocky

snowflush areas at 2620 to 3420 m in Cache, Duchesne, Iron, Juab, Salt Lake, Summit, Uintah, and Wasatch counties; British Columbia to Alberta and south to California; 50 (v).

Juncus regelii Buch. Regels Rush. [*J. jonesii* Rydb., type from Alta]. Perennial plants 10–60 cm tall; stems arising singly or few together from creeping rhizomes; leaves basal and extending well up on the stems, the scarios margins of the sheaths prolonged into inconspicuous or short auricles, the blades flat, 2–4 mm wide, neither hollow nor septate; involucre bract 1–4 cm long; inflorescence with 1–5 globose or hemispherical heads, the heads 8–20 mm across; bractlets subtending the heads scarios; bracteoles lacking; pedicels ca 1–2 mm long; perianth segments 4–6 mm long, papillose-roughened on the back, with a greenish midstripe flanked by dark brown and with scarios margins, the inner ones slightly shorter and slightly less pointed than the outer ones; stamens 6, the anthers 1–1.5 mm long, subequal to the filaments; capsules 3-loculed, subequal to the perianth, oblong-ovoid, truncate to retuse; body of seeds about 0.5 mm long, tailed at each end, the tails about as long or longer than the body. Meadows and along streams at 2750 to 3060 m in Duchesne, Salt Lake, and Wasatch counties; southern Washington to northern California and east to Montana; 8 (i). Much like *J. longistylis* but distinct in the tailed seeds and more or less marked by papillose-roughened perianth.

Juncus tenuis Willd. Poverty Rush. [*J. dudleyi* Wieg.; *J. interior* Wieg.; *J. tenuis* var. *dudleyi* (Wieg.) F. Hermann; *J. tenuis* var. *congestus* Engelm.] Perennial, caespitose plants 22–65 cm tall, with fibrous roots; rhizomes lacking; stems terete, to 1.8 mm wide; leaves basal and cauline, borne on the lower 1/5 of the plant, those of the stem mostly with well-developed blades, some of the basal ones with blades reduced to bristles, scarios margins of the sheaths projected into auricles to ca 0.75 mm long, the blades flat but soon moderately to strongly involute, not hollow, not septate, to ca 2 mm wide; involucre bract 2–18 cm long, leaflike; inflorescence (0.7) 1.5–8.5 cm long, congested to rather open, with (4) 10–50 or more flowers, the flowers borne singly; bractlets subtending branches and pedicels scarios, caudate-acuminate or awned, or the lower ones leaflike and similar to the involucre bract; pedicels obsolete or to 5 mm long; bracteoles subtending the flowers, scarios, ovate to lanceolate, acute to caudate; perianth segments 4–5 mm long, subequal or the outer ones a little longer than the inner, the outer ones narrowly acuminate or acuminate-attenuate with the hyaline margins mostly not extending on to the acuminate tip, the inner ones mostly acute to slightly acuminate with the hyaline margins often extending to the tip; stamens 6, the filaments 0.6–1 mm long, the anthers 0.5–0.8 mm long; styles and stigmas ca 1.5 mm long; capsules imperfectly 3-loculed, 1–2 mm shorter than the perianth, obtuse to truncate; body of seeds 0.3–0.4 mm long, with apiculate ends to ca 0.1 mm long; $2n = 40, 80, 84$. Along streams, washes, ditchbanks, rivers, margins of ponds and reservoirs, about seeps and springs, and in meadows and hanging gardens at 1135 to 2380 m in Cache, Daggett, Duchesne, Garfield, Grand, Millard, Rich, San Juan, Uintah, Utah, Wasatch, Washington, and Wayne counties; widespread in North America and introduced in temperate regions elsewhere in the world; 41 (iv). Three intergradient phases are present in

our plants: var. *dudleyi* with cartilaginous, often yellow to brown auricles ca 0.5 mm long, and vars. *congestus* and *tenuis* with membranous, usually greenish or whitish auricles often over 0.5 mm long, the former with congested panicles mostly less than 3 cm long, the latter with open panicles mostly over 3 cm long. The morphological differences are minor at best and the apparent taxa are more or less sympatric. However, plants with features of var. *tenuis* do seem to be more common in the southern half of Utah. Perhaps the recognition of these varieties serves more to waste time than to achieve any purpose.

Juncus torreyi Cov. Torrey Rush. Perennial plants (1) 2–8 (10) dm tall; stems terete, to 6 mm in diameter near the base, arising singly or a few together from robust creeping rhizomes, the rhizomes often with swollen tuberlike segments; leaves well distributed up the stem, the scarios margins of the sheaths prolonged into auricles, (1.5) 2–5 mm long, the blades terete sometimes channeled on the upper side, hollow, septate, 1–3 mm thick; involucre bract 1.5–17 cm long, more or less leaflike; inflorescence 1.5–7 cm long, congested, with (1) 3–13 more or less globose and sometimes burlike heads, the heads 6–15 mm across, with 10–50 or more flowers, the flowers widely spreading, with some usually reflexed; pedicels very short and hidden in the compact heads; bracteoles lacking; perianth segments 4–5 mm long or the inner ones slightly shorter, long-acuminate and rigid at the tip; stamens 6, the filaments 0.7–1 mm long, the anthers 0.5–0.8 mm long; styles ca 0.25 mm long, the stigmas ca 1 mm long; capsules incompletely 3-loculed, slender, triquetrous, equal to or slightly longer than the perianth, the slender stylar beak tardily dehiscent; seeds 0.4–0.5 mm long, apiculate but not tailed. Along streams, rivers, washes, and ditchbanks, at margins of ponds and lakes, about seeps and springs, and in saline or alkaline, moist to wet meadows, marshes and swamps at 850 to 2010 m in all Utah counties, except Iron, Millard, Piute, Summit, and Wasatch; southern Canada to northern Mexico; 112 (iv).

Juncus triglumis L. Three-flowered Rush. Perennial plants 4–19 cm tall, densely caespitose; leaves basal or on the lower 1/4 of the stems, those of the stem with well-developed blades, scarios margins of sheaths projected into auricles to ca 0.8 mm long, the blades ca 0.5 mm wide, hollow, separate; involucre bract 5–10 mm long, often purplish; inflorescence a solitary head, this 5–8 mm long, with (1) 2–5 flowers, the bractlets subtending the pedicels similar to but somewhat smaller than the involucre bract; pedicels to ca 1 mm long; perianth segments 3–4 mm long, acute, cream, yellowish or greenish yellow, and often marked with purple; stamens 6, as long as the perianth or ca 1 mm shorter, the filaments to 2 mm long, the anthers 0.5–0.8 mm long; stigmas and styles ca 1 mm long; capsules shorter or ca 1 mm longer than the perianth, abruptly tapered to blunt or subtruncate at the tip, blackish purple; trigonous-cylindric body of seeds ca 0.7–1 mm long, tailed at both ends, each tail ca 1/2 to as long as the body, more or less flattened, scarios; $n = 22$; $2n = 132$. Wet meadows and bogs at 2800 to 3810 m in the Uinta Mts., Daggett, Duchesne, Summit, and Uintah counties; circumboreal, south in the Rocky Mts. to New Mexico; 10 (v). Utah plants are referable to var. *albescens* (Fern.) Lange [*J. albescens* Fern.].

Juncus tweedyi Rydb. [*J. canadensis* var. *kuntzei* Buch., type from near Corinne, Box Elder County].

Perennial plants 20–40 cm tall, the stems clustered, terete; rhizomes apparently lacking; leaves basal and cauline, the scarios margins of the sheath projected into auricles (0.5) 1–2 mm long, the blades 1–2.5 mm thick, terete or nearly so, hollow, septate; involucrel bract shorter than or somewhat longer than the inflorescence, this with 2–8 heads, these with 3–8 flowers, 3–8 mm wide, brown, bractlets subtending the heads and pedicels scarios; bracteoles lacking; perianth segments 3–4 mm long, gradually acute, the inner ones equal to or a little longer than the outer; stamens 3, the anthers 0.5–0.7 mm long, shorter than the filaments; capsule slightly longer than the perianth, triquetrous, more or less acute, imperfectly 3-loculed; seeds cylindrical with tails ca 1 mm long at each end. Near Corinne in Box Elder County (Kuntze 3133, NY). Wet places about hot springs, Yellowstone National Park, Wyoming; 1 (0).

Luzula DC.

Perennial grasslike herbs generally with long, spreading hairs along the margins of leaf blades at least when young; leaves sheathing, the sheaths closed, the blades flat; inflorescence headlike or spicate to open-paniculate; flowers subtended by bracteoles; perianth segments 6; stamens 6; capsules 1-loculed, with 3 seeds, dehiscent along the midribs of the carpels; seeds with or without caruncles, sometimes comose with extremely fine hairs.

1. Inflorescence an open panicle, the panicle sometimes drooping; leaves glabrous or nearly so at maturity, the blades 3–11 mm wide; plants 27–77 cm tall . . . *L. parviflora*
- Inflorescence of few to several congested or remote spikes or spikelike racemes, sometimes headlike; margins of leaves pubescent with long hairs especially near the collar, 1–6 mm wide; plants 5–42 cm tall 2
- 2(1). Flowers borne in a terminal compound spikelike or headlike inflorescence; leaves 1–3 mm wide; seeds without or with an inconspicuous caruncle; plants widespread *L. spicata*
- Inflorescence with 1 or more lateral spikes, some of the lateral ones often borne on peduncles to 3 (5.5) cm long, leaves 2–6 mm wide; seeds with a conspicuous caruncle; plants known from the Uinta Mts. *L. campestris*

Luzula campestris (L.) DC in Lam. & DC. Hairy Woodrush. [*Juncus campestris* L.; *L. multiflora* (Retz.) Lej.; *L. intermedia* (Thuill.) A. Nels.] Plants 13–42 cm tall; stems more or less tufted; leaves basal and cauline, the blades flat, 2–6 mm wide, the margins with scattered to moderately dense villous hairs ca 2–7 mm long or longer; involucrel bract 3–9 mm long, leaflike, some of the bractlets subtending branches and peduncles herbaceous, others scarios; inflorescence 1.5–5 cm long, usually conspicuously branched, with 3–12 spikes, these 5–12 mm long, sessile or on peduncles to 3 (5.5) cm long, with 5–15 or more flowers; bracteoles subtending the flowers hyaline, entire or ciliate to fringed; perianth segments 2–3.5 mm long, greenish to brownish, acute or acuminate to scarcely caudate; anthers ca 0.5–1 mm long, the filaments subequal to the anthers; capsules equal to or shorter than the perianth; seeds 1.4–1.7 mm long, with a whitish caruncle ca 0.3–0.6 mm long; $2n = 12, 24, 36$. Lodgepole pine, Engelmann spruce, and meadow communities at 2440 to 3110 m in the Uinta Mts., Daggett, Duchesne, Summit, Uintah, and Wasatch counties; widespread in temperate regions of the world; 10 (vii).

Utah plants apparently belong to var. *multiflora* (Ehrh.) Celak. [*Juncus multiflorus* Ehrh.].

Luzula parviflora (Ehrh.) Desv. Millet Woodrush. [*Juncus parviflorus* Ehrh.; *L. wahlenbergii* Rupr., misapplied]. Plants 27–77 cm tall, stems solitary or few together from short rhizomes and fibrous roots; leaves basal and cauline, glabrous or with a few scattered long-villous hairs especially near the collar, the blades flat, 2–11 mm wide; involucrel bract scarios and as short as 1 cm or leaflike and to 4 (7) cm long, shorter than the inflorescence, sometimes sheathing at the base for up to 1 cm; inflorescence 3.5–16 cm long, open-paniculate, with slender flexuous branches; bractlets subtending the branches mostly scarios, sometimes fimbriate toward the apex; flowers borne singly on slender pedicels to 10 mm long or 2 or 3 together on very short pedicels; bracteoles subtending the flowers hyaline, ovate-acute, entire to incised; perianth segments 1.5–2.5 mm long, brownish and partly hyaline, acute to acuminate, subequal; anthers 0.3–0.4, the filaments ca 0.5 mm long; capsules slightly longer than the perianth, blackish purple, shiny; seeds 1.2 mm long, with obsolete or inconspicuous caruncles at each end; $2n = 22, 24, 36$. Ponderosa pine, aspen, lodgepole pine, spruce-fir, willow-streamside, and wet meadow communities at 2300 to 3475 m in Beaver, Box Elder, Carbon, Daggett, Duchesne, Garfield, Grand, Iron, Juab, Piute, Salt Lake, San Juan, Sanpete, Sevier, Summit, Uintah and Wasatch counties; circumboreal, extending south in western North America to California and New Mexico; 84 (v).

Luzula spicata (L.) DC. Spike Woodrush. [*Juncus spicatus* L.]. Plants 5–40 cm tall, stems more or less caespitose from fibrous roots, rhizomes apparently lacking; leaves basal and cauline, the blades flat and 1–3 mm wide or involute and to only 0.5 mm wide, the margins with scattered to moderately dense, long-villous hairs; involucrel bract 0.7–4 cm long, bractlike or occasionally leaflike, shorter than or equal to the inflorescence or occasionally longer; inflorescence 1–3 cm long, often nodding, of ca 4–10 or perhaps more sessile or subsessile heads or short spikes that are congested into a continuous or basally interrupted compound spike, the individual heads or spikes with few to several flowers; bractlets subtending the spikes or heads scarios and bractlike, or rarely leaflike; bracteoles subtending flowers scarios, fimbriate-ciliate, acuminate-caudate; perianth segments 2–3 mm long, dark brown or partly hyaline, acuminate or acuminate caudate, the inner ones a little shorter than the outer; anthers 0.3–0.5 mm long, ca 1/2 as long to as long as the filaments; capsules a little shorter than the perianth; seeds 1–1.3 mm long, the caruncle obsolete or inconspicuous, not over 0.2 mm long; $2n = 24, 36$. Lodgepole pine, spruce, fir, dry meadow, wet meadow, streamside-meadow, alpine tundra, and rarely aspen and oak-ponderosa pine communities, also in talus and fell fields at 2470 to 3810 m in Daggett, Duchesne, Grand, Juab, Piute, Salt Lake, San Juan, Summit, Tooele, and Uintah counties; circumboreal, south in western North America to California and Arizona; 65 (vi).

JUNCAGINACEAE Rich.

Arrowgrass Family

Herbs of marshes and wet meadows, perennial, rhizomatous; leaves 2-ranked, mainly basal, linear, sheathing at the base; inflorescence a terminal spike; flowers

perfect or imperfect, regular; perianth segments usually 6, in 2 series of 3; stamens commonly 6; pistil 1, the ovary 3- to 6-carpellate; fruit capsular; $x = 6, 8, 9$.

Triglochin L.

Wandlike perennials; flowers few to numerous; anthers oblong to elliptic, sessile or nearly so; carpels 3 or 6, at length separating and sometimes only the inner 3 fertile and each 1-seeded.

- 1. Stigmas 3; fruit linear to clavate, 5-8 mm long, the carpels tapering to the base *T. palustris*
- Stigmas 3; fruit cylindrical to ovoid-angled, 4-6 mm long, the carpels not tapering at the base 2
- 2(1). Ligules 1-5 mm long; leaf blades 1-4 mm wide; stems tufted, mainly 3-10 dm tall *T. maritima*
- Ligules 0.5-1 mm long; leaf blades 0.5-1.5 mm wide; stems solitary along the rhizome, mainly 1.5-4 dm tall *T. concinna*

Triglochin concinna Davy Low Arrowgrass. Plants mainly 1.5-4 dm tall, the stems borne along a slender rhizome; leaves linear, 8-20 cm long, typically much overtopped by the spike, the blade 0.5-1.5 mm wide, subterete, the ligule bilobed, 0.5-1 mm long; flowers few to many, spaced along the spicate raceme; pedicels 2-4 mm long; perianth 6-segmented, 1-1.5 mm long, green; stigmas 6; fruit short-cylindroid, 4-5 mm long, the carpels all fertile, rounded at the base, finally deciduous from the axis. Saline seeps and marshes at 1280 to 2105 m in Beaver, Box Elder, Cache, Daggett, Garfield, Iron, Juab, Millard, Rich, San Juan, Sanpete, Tooele, and Washington counties; British Columbia to the Dakotas, south to Baja and Arizona; 11 (i). Our material, which is not always separable from dwarf specimens of *T. maritima*, belongs to var. *debilis* (Jones) J. T. Howell [*T. maritima* var. *debilis* Jones, type from Johnson, Kane County; *T. debilis* (Jones) Love & Love].

Triglochin maritima L. Maritime Arrowgrass. Plants 0.7-10.5 dm tall (rarely more) from a thick woody rhizome; leaves linear, 2-50 cm long, flattened or channeled, mostly 2-4 mm broad, obtuse apically, the sheath prominently hyaline-margined; racemes several- to many-flowered, the flowers not subtended by bracts; pedicels 1-4 mm long; perianth segments greenish or yellowish, 1-2.2 mm long; fruit ovoid-oblong, mostly 4-6 mm long, deciduous, the axis terete; $2n = 24, 36, 48$. Wet meadows and other moist sites in salt desert shrub, mixed desert shrub, sagebrush, mountain brush, aspen, ponderosa pine, and spruce-fir communities at 1310 to 2685 m in all Utah counties except Beaver, Millard, and Morgan; widespread in North America; circumboreal; 79 (ix). This plant occurs in meadows that are cut for wild hay. Drying plants yield hydrocyanic acid, which causes poisoning of livestock.

Triglochin palustris L. Marsh Arrowgrass. Plants 0.8-6.5 dm tall from short, ascending rhizomes; leaves linear-filiform, 2-28 cm long, flattish, 0.3-2 mm broad, acutish apically, the sheath narrowly hyaline-margined; racemes with few to many flowers, the flowers not subtended by bracts; pedicels 1-6 mm long; perianth segments yellowish or greenish, often suffused with purple, 1.5-2 mm long; fruit linear-clavate, commonly 8-10 mm long, the carpels separating from the base and remaining attached apically; $2n = 24, 28, 36$. Wet meadows and

other moist sites in ponderosa pine, aspen, spruce-fir, and lodgepole pine communities at 1830 to 2960 m in Daggett, Duchesne, Garfield, Grand, Kane, Piute, Salt Lake, Sanpete, Sevier, Summit, and Uintah counties; Alaska to the Atlantic, south to California, New Mexico, Iowa, and New York; circumboreal; Southern Hemisphere; 14 (ii).

LEMNACEAE S. F. Gray

Duckweed Family

Plants small, free-floating or submersed aquatic perennials with flattened, thalluslike stems (fronds), these rootless or with 1 or more simple roots borne on the lower surface; leaves lacking; reproducing vegetatively; flowers rarely produced, borne in a sac- or flask-shaped spathe; staminate flowers consisting of a single stamen (rarely 2); pistillate flowers of a single carpel with 1 to several ovules; perianth lacking; fruit a utricle; $x = 8, 10, 11, 21$. This is the simplest and smallest of the flowering plants, reproducing mainly by budding.

- 1. Roots lacking; fronds veinless, ellipsoid *Wolffia*
- Roots 1 or more per plant; fronds with 1 to several veins 2
- 2(1). Root 1 per frond; plant body with 1-5 veins *Lemna*
- Roots several per frond; plant body with 5-11 veins *Spirodela*

Lemna L.

Fronds flattened, free-floating or somewhat submersed, 1- to 5-veined, orbicular to obovate, each frond with 1 root; flowers 3, 1 pistillate and 2 staminate, borne in a pouch; anthers 2-loculed; ovary 1-loculed and 1- to several-ovuled. Note: Specimens from Utah have been annotated by F. Landolt with an array of names whose taxonomic delimitations are not understood by this worker. A future revision of the genus seems likely.

- 1. Fronds long-stalked, 6-12 mm long, elliptic to somewhat lanceolate *L. trisulca*
- Fronds not stalked or the stipe very short, oblong to ovate 2
- 2(1). Dorsal surface of fronds flat and smooth, veinless or with 1 vein; fronds usually elliptic, 1.5 mm wide or less 3
- Dorsal surface of fronds with evident protuberances, faintly 3-veined, fronds obovate to orbicular, mostly over 1.5 mm wide 4
- 3(2). Fronds 2.5-5 mm long, elliptic to obovate, in colonies of 2 or more *L. valdiviana*
- Fronds 2.5 mm long or less, ovoid to elliptic, solitary or in pairs *L. minuta*
- 4(2). Fronds mainly 3.5-6 mm long and 2.5-5 mm wide, obovate to orbicular, the dorsal surface mottled yellowish green, the 3 nerves distinct; fruit winged, usually 2-seeded (at least) *L. gibba*
- Fronds various in size but, if as above, the dorsal surface uniformly green and the three nerves indistinct; fruit not winged, usually 1-seeded 5
- 5(4). Fronds 1.5-3.5 mm long, 1-2.5 mm wide, oblong to obovate *L. obscura*
- Fronds 3-6 mm long, 1.5-4 mm wide, obovate to sub-orbicular *L. minor*

Lemna gibba L. Fronds obovate to orbicular, 1-4 per colony, 3.5-6 mm long, 2.5-5 mm wide, usually 3-veined, mottled or green above, flat to somewhat convex, strongly inflated to gibbous below at maturity; fruits winged and with 1 or more seeds; 2n = 40, 50, 60?, 80. Ponds, lakes, and sluggish streams at ca 1370 m in Utah County; widespread in temperate and tropical regions of the world; 1 (0).

Lemna minor L. Lesser Duckweed. Fronds solitary or in colonies of a few floating fronds, ovate to suborbicular, 3-6 mm long, 1.5-4 mm wide, symmetrical or nearly so, thickish, obscurely 3-nerved, upper surface sometimes keeled and with a row of papillae along the midrib, surfaces green or purplish; fruits not winged, 1-seeded; 2n = 20, 30, 40, 42, 50, 80. Common species of ponds, lakes, and sluggish streams at 1060 to 2440 m in Box Elder, Davis, Cache, Garfield, Kane, Morgan, Rich, Salt Lake, Sevier, Utah, and Wasatch counties; widespread in North America; almost cosmopolitan; 11 (0).

Lemna minuta H.B.K. [*L. minima* Kunth; *L. minuscula* Herter; *L. valdiviana* var. *minima* (Kunth) Hegelm.] Fronds solitary or in pairs, floating, ovoid to elliptic, 2.5 mm long or less, 1-veined or veinless, flat or slightly convex above and below, usually with a row of papillae along the nerves on the upper surface; fruits not winged and with 1 seed. Ponds, lakes, and sluggish streams at 1370 to 2625 m in Cache, Davis, Duchesne, Kane, Millard, Salt Lake, Utah, Wasatch, Washington, and Weber counties; California and Nevada to Texas; South America; 12 (i).

Lemna obscura (Austin) Daubs [*L. minor* var. *obscura* Austin in Gray]. Fronds obovate to oblong, 1.5-3.5 mm long, 1-2.5 mm wide, solitary or in groups of 2 or 3, floating, upper surface darker green, lower surface slightly reddish and inflated, obscurely 3-veined; fruits wingless, 1-seeded. Sluggish streams and ponds at 1430 to 2685 m in Beaver, Daggett, Garfield, Sevier, Uintah, and Utah counties; widely distributed in the U. S.; 11 (0).

Lemna trisulca L. Ivy-leaf Duckweed. Fronds usually floating just below the surface, with several generations attached to each other, 2.5-8.5 mm long, 0.9-3.2 mm wide, elliptic to lanceolate, obscurely 3-veined, denticulate at the apex; fruit asymmetrical; seeds ribbed; 2n = 20, 40, 44, 60, 80. Springs, streams, ponds, and lakes at 1525 to 2592 m in Cache, Garfield, Millard, Morgan, Salt Lake, Sevier, Summit, and Utah counties; widely distributed in North America; circumboreal; 10 (0).

Lemna valdiviana Phil. Fronds 2.5-5 mm long, elliptic to obovate, borne in colonies of 2 or more, floating or submersed, strongly asymmetrical at the base, the tip symmetrical, more or less flat on both surfaces and pale green, obscurely 1-veined; fruit wingless, 1-seeded. Ponds, lakes, and sluggish water at 820 to 2745 m in Cache, Utah, Washington, and Weber counties; widely distributed in North America; South America; 5 (0).

Spirodela Schleiden

Fronds flattened, colonial by elongate stipes, obovate to orbicular, with several roots per frond, greenish or reddish; flowers monoecious in pouches, with 2 or 3 staminate and 1 pistillate per lateral pouch; stamens 1 per flower; pistils 2-ovuled.

Spirodela polyrhiza (L.) Schleiden [*Lemna polyrhiza* L.]. Floating colonial or solitary plants, the fronds rounded-obovate, flat, dark green above and usually pur-

plish beneath (sometimes also above), 4-7 mm long, 2-6 mm wide, with 5-11 nerves and 5-12 rootlets; fruits somewhat winged. Wet meadows, sluggish streams, and ponds at 1280 to 1405 m in Cache, Davis, Salt Lake, and Utah counties; widely distributed in North America; Eurasia, Africa, and Australia; 7 (0).

Wolffia Horkel ex Schleiden

Small, floating, rootless plants, globular, solitary, and greenish brown; flowers unisexual, 2 per spathe from the upper surface, 1 staminate and 1 pistillate; anthers 1-loculed; ovary 1-loculed and with 1 ovule; fruit a utricle, 1-seeded.

Wolffia punctata Griseb. Fronds 0.7-1.2 mm long, 0.4-0.7 mm wide, solitary, rootless, globular, bearing stomata on the upper surface, punctate both ventrally and dorsally. Open water in Cache, Morgan, and Weber counties; widespread in North America; 3 (0).

LILIACEAE A. L. Juss.

Lily Family

Herbaceous perennials from bulbs, corms, or rhizomes; stems annual, dying to below ground level each year; flowers regular or nearly so, perfect; sepals 3; petals 3, distinct or connate; stamens 6; pistil 1, the ovary superior, 3-loculed; style 1 or 3; stigma 3-lobed or 3; fruit a capsule or a berry; x = 3-19+.

- 1. Perianth segments not alike, the sepals of different color or texture from the petals; plants indigenous *Calochortus*
- Perianth segments alike, the sepals and petals both petaloid in color and texture 2
- 2(1). Inflorescence umbellate, or subumbellate and nearly sessile 3
- Inflorescence a raceme, panicle, or corymb, or the flowers solitary and yet not umbellate 7
- 3(2). Perianth 3-8 cm long, the lobes white; umbel subsessile, arising from below ground *Leucocrinum*
- Perianth less than 2 cm long, variously colored; umbels scapose, borne above ground 4
- 4(3). Perianth segments distinct or nearly so; plants with odor of onion or garlic *Allium*
- Perianth segments united below the middle; plants not smelling of onion or garlic 5
- 5(4). Staminal filaments distinct; styles 2-4 mm long; capsules stipitate *Triteleia*
- Staminal filaments united; styles 4-6 mm long; capsules sessile 6
- 6(5). Stamens in 2 series, the anthers dissimilar; leaves 2-5; capsules 4-6 mm long; plants mostly 3-6 dm tall or more; flowers blue *Dichelostemma*
- Staminal filaments in 1 series, the anthers alike; leaves often more than 5; capsules 10-15 mm long; plants 1-3 dm tall; flowers whitish to greenish, with purple veins *Androstephium*
- 7(2). Stems much-branched, from thick, tuberous roots; leaves minute, scalelike, subtending filiform, leaflike branchlets (phyllodia) *Asparagus*
- Stems or scapes simple or sparingly branched, underground parts various, but usually not consisting of thick, tuberous roots; leaves neither scalelike nor subtending phyllodia 8

- 8(7). Plants 10–20 dm tall; leaves 15–30 cm long and at least some of them over 8 cm wide; flowers borne in panicles, these usually more than 20 cm long and 10 cm wide *Veratrum*
- Plants mainly less than 10 dm tall; leaves less than 15 cm long or less than 8 cm wide or both; flowers solitary, in racemes, or panicles but, if the latter, usually less than 20 cm long 9
- 9(8). Flowers borne separately from the foliage leaves, either at different seasons or on separate stems; plants cultivated 10
- Flowers terminating leafy branches of the season, or in leaf axils 11
- 10(9). Flowers 5–8 cm wide, usually pink to lavender, erect, appearing in autumn, the leaves borne in springtime *Colchicum*
- Flowers 4–6 mm wide, white, nodding, appearing in springtime, the leaves borne on separate branches *Convallaria*
- 11(9). Flowers solitary or few, the perianth segments 2–4 cm long or more, sometimes the calyx not distinctly petaloid; plants cultivated and escaping *Tulipa*
- Flowers few to many or, if solitary, smaller than above 12
- 12(11). Leaves definitely cauline; peduncles or pedicels less than 10 cm long 13
- Leaves definitely basal or, if on lower stem, the peduncles or scapes often more than 1 dm long 18
- 13(12). Flowers solitary in ovate to lanceolate leaf axils *Streptopus*
- Flowers terminal, either solitary, paired, or in racemes or panicles; leaves various 14
- 14(13). Flowers 1 or few, nodding; perianth white to cream, 8–12 mm long; stems dichotomously branched *Disporum*
- Flowers solitary or numerous, borne in racemes or panicles, not nodding or, if so, the perianth larger 15
- 15(14). Flowers numerous, borne in racemes or panicles; plants arising from rhizomes *Smilacina*
- Flowers solitary or few; plants bulbous 16
- 16(15). Flowers white, the segments with purple veins; plants of alpine tundra *Lloydia*
- Flowers variously colored, spotted in some; plants seldom if ever of alpine tundra 17
- 17(16). Flowers often reflexed and with tips of petals reflexed, mainly 3–7 cm long or more; plants cultivated and persisting *Lilium*
- Flowers reflexed or not, the petals erect to spreading, mainly 1–2 cm long; plants indigenous *Fritillaria*
- 18(12). Perianth segments united, at least below 19
- Perianth segments distinct or nearly so 21
- 19(18). Flowers orange red, the segments 7–12 cm long; plants cultivated *Hemerocallis*
- Flowers variously colored, the segments less than 3 cm long 20
- 20(19). Perianth typically blue purple, 5–9 mm long, urn-shaped, not opened at the throat; lobes very short *Muscari*
- Perianth variously colored, 1.5–2.5 cm long, bell-shaped, open at the throat; lobes long and spreading *Hyacinthus*

- 21(18). Plants shortly rhizomatous, with thickened roots; flowers white, numerous in contracted, racemose panicles; growing in sandy deserts in southeastern Utah *Eremocrinum*
- Plants bulbous; flowers variously colored, solitary, few, or numerous, borne in open racemes or panicles; diverse in habitat and distribution 22
- 22(21). Flowers bright yellow, nodding, the segments reflexed, solitary or few *Erythronium*
- Flowers white, cream, or blue, nodding or erect, the segments erect or spreading, solitary to numerous 23
- 23(22). Perianth white to cream 24
- Perianth blue, or blue and white (rarely white in some) 25
- 24(23). Flowers in corymbose racemes; plants cultivated and more or less weedy *Ornithogalum*
- Flowers in racemes or panicles, not corymbose; plants indigenous *Zigadenus*
- 25(23). Flowers several to many in racemes; plants indigenous *Camassia*
- Flowers solitary or few in contracted racemes; plants cultivated 26
- 26(25). Flowers nodding, blue throughout *Scilla*
- Flowers erect, the lobes blue apically, white at the base *Chionodoxa*

Allium L.

Perennial herbs with odor of onion or garlic, scapose from tunicate bulbs or less commonly from rhizomes; leaves 1 to several, linear to narrowly oblanceolate or elliptic, flat to terete, hollow or solid, often withered or deciduous at anthesis; flowers perfect, borne in spathaceous umbels or else subcapitate, sometimes replaced by bulblets; sepals 3, petaloid; petals 3, petaloid, distinct or nearly so; stamens 6, more or less connate at the base and adherent to the perianth segments; ovary sessile, 3-lobed, sometimes 3- or 6-crested, 3-loculed, with 2 to several ovules per locule; style 1, the stigma capitate to 3-lobed; capsule loculicidal, usually 6-seeded.

Cronquist, A. 1977. *Allium*. pp. 508–522. In: Cronquist et al. Intermountain Flora. Vol. 6. Columbia University Press, New York. 584 pp.

- 1. Outer bulb coat traversed by coarse, interwoven fibers 2
- Outer bulb coat not coarsely fibrous 5
- 2(1). Spathaceous bracts 3- to 5-nerved; ovary usually strongly crested; leaves typically 2 per scape; plants of southeastern Utah *A. macropetalum*
- Spathaceous bracts typically 1-nerved; ovary low crested to crested; plants of broad or other distribution 3
- 3(2). Leaves flat, curved, mostly 3–6 mm wide, 2 or 3 per scape; perianth pink; plants of Box Elder County *A. passeyi*
- Leaves semi-cylindric or grooved, not especially curved, 2 or more per scape; plants broadly distributed 4
- 4(3). Leaves 3 or more per scape; perianth pink (or white); plants of moist montane sites mainly east of the mountain and plateau axis, except in western Garfield county *A. geyeri*
- Leaves typically 2 per scape; perianth white; plants of lower elevation sites in eastern Utah *A. textile*

- 5(1). Bulbs hollow, terete or channeled; plants cultivated 6
 — Leaves seldom hollow, typically flattened or keeled; plants indigenous 7
- 6(5). Scapes inflated *A. cepa*
 — Scapes not inflated *A. schoenoprasum*
- 7(5). Inflorescence nodding at anthesis; ovary strongly crested; stamens exserted; plants of eastern Utah *A. cernuum*
 — Inflorescence erect at anthesis; ovary crested or not; stamens various 8
- 8(7). Bulbs borne on short, stout rhizomes, elongate; outer bulb scales striate with elongate cells arranged in regular, vertical rows *A. brevistylum*
 — Bulbs not, or seldom, borne on rhizomes, ovoid to subglobose; outer bulb scales variously ornamented, but not as above 9
- 9(8). Leaves 1 per scape, the leaf terete or essentially so ... 10
 — Leaves 2 or more per scape, the leaves flat or channeled 11
- 10(9). Outer bulb scales not reticulate; perianth typically dark rose purple (at least when dry); plants of Beaver, Kane, and Millard counties *A. atrorubens*
 — Outer bulb scales reticulate; perianth typically rose pink, often drying pale pink; plants widely distributed *A. nevadense*
- 11(9). Outer bulb scales with walls of cellular reticulations thin, minutely sinuous, striate above; ovary strongly 6-crested, the crests triangular and minutely serrulate; plants mainly of the western half of Utah, less commonly in Kane and San Juan counties *A. biceptrum*
 — Outer bulb scales with walls of reticulum not both thin and sinuous, or not reticulate, not especially striate above; ovary variously crested 12
- 12(11). Leaves 2-4, linear, subterete or grooved, flexuous, shorter than the scape; bulb coats with prominent, thick-margined, cellular reticulations; plants broadly distributed *A. acuminatum*
 — Leaves 2 (or 1), flat, curved, usually surpassing the scape; bulb coats not especially reticulate 13
- 13(12). Perianth 7-10 mm long; ovary crested; plants of central western Utah *A. parvum*
 — Perianth 5-8 mm long; ovary not crested; plants common from Millard and Sanpete counties northward, less common elsewhere *A. brandegei*

Allium acuminatum Hook. Bulbs 1-1.5 cm long and as wide or wider, buried (2) 2.5-10 (12) cm, the scales reticulate with evidently thickened ridges, not fibrous-shredded; leaves 2-4, linear, concave-convex, shorter than the scape, typically with sheathing, purplish bases; scapes (6) 10-30 cm tall (above ground); spatheaceous bracts 2, 10-25 mm long; umbel (3) 15- to 38-flowered, the pedicels straight or curved; perianth 7-12 mm long, rose to pink purple or pink (white), the segments dimorphic, with recurved tips; stamens included; ovary minutely crested and with 3 minute, bilobed processes; $2n = 14$. Sagebrush, mountain brush, pinyon-juniper, and ponderosa pine communities at 1370 to 2685 m in all Utah counties except Carbon, Emery, Iron, Kane, Morgan, Piute, and Wayne; British Columbia to Idaho and Wyoming, south to California, Nevada, and Arizona; 104 (ix).

Allium atrorubens Wats. Bulbs 0.8-1.5 cm long, 0.6-1.2 cm thick, buried 3-11 cm, the scales not reticu-

late (merely cellular), not fibrous-shredded; leaves solitary, typically surpassing the scape, linear, terete to semiterete, the sheathing bases usually hyaline; scapes 2-10 cm long (above ground); spatheaceous bracts 2 or 3, 5-13 mm long; umbels 8- to 25-flowered, the pedicels usually straight; perianth 7-12 mm long, deep rose purple to less commonly, pinkish or white, the segments subequal, with tips spreading; stamens included; ovary crested, the crests thin, entire or toothed. Shadscale, sagebrush, and pinyon-juniper communities at 1430 to 1925 m in Beaver, Kane, and Millard counties; Nevada and California; 8 (i).

Allium biceptrum Wats. [*A. palmeri* Wats.; *A. biceptrum* var. *palmeri* (Wats.) Cronq.; *A. biceptrum* var. *utahense* Jones, type from City Creek Canyon, Salt Lake County]. Bulbs 1-1.5 cm long and about as thick, buried 1-9 cm below ground, the scales cellular-reticulate, the reticulum subrectangular, with minutely sinuous vertical walls or irregular and with all sides sinuous; leaves 2-4, shorter than the scape, flat or broadly channeled, 2-13 mm wide, usually persistent at anthesis, the sheathing bases hyaline to purplish; scapes 10-40 cm tall (above ground); spatheaceous bracts 2, distinct, 3- to 5-veined; umbels 8- to 36-flowered, the pedicels straight to curved; perianth pink purple to pink or white, 7-12 mm long, the segments subequal, the tips usually erect; stamens included; ovary strongly crested, with 6 triangular, flattened, denticulate-papillose crests; $2n = 18$. Sagebrush, pinyon-juniper, mountain brush, aspen, grass-forb, and spruce-fir communities at 1370 to 3145 m in Beaver, Box Elder, Cache, Davis, Iron, Juab, Kane, Millard, Morgan, Piute, Salt Lake, San Juan, Sevier, Summit, Tooele, Utah, Washington, and Weber counties; Oregon and Idaho, south to California, Arizona, and New Mexico; 42 (iv). Our materials have been treated as belonging to two varieties, separable on a series of overlapping and difficultly discernable features. Their recognition seems to be moot. Reports of *A. campanulatum* Wats. probably belong with this taxon.

Allium brandegei Wats. [*A. tribracteatum* var. *diehlii* Jones, type from Parleys Canyon; *A. diehlii* (Jones) Jones]. Bulbs 0.7-1.7 cm long and about as thick, typically purple and shiny beneath the older scales, buried 2-15 cm below ground, the scales minutely reticulate with rectangular cells; leaves 2 per scape, linear, channeled to flattened, 1-6 mm wide, usually persistent at anthesis, the sheathing bases usually hyaline; scapes 1-12 cm tall (above ground); spatheaceous bracts 2 or 3, several-veined; umbels 5- to 35-flowered, the pedicels curved or straight; perianth white or less commonly pink, 5-11 mm long, the segments subequal, the tips usually erect; stamens included; ovary not crested; $2n = 14$. Sagebrush, mountain brush, grass-forb, lodgepole pine, aspen, spruce-fir, and alpine tundra communities at 1830 to 3355 m in Box Elder, Cache, Davis, Duchesne, Juab, Millard, Salt Lake, Sanpete, Sevier, Summit, Uintah, Wasatch, Washington, and Weber counties; Oregon to Montana, south to Nevada and Colorado; 50 (v). A collection from Washington County, included here within *A. brandegei*, consists of unusually robust plants with bright pink flowers, but these seem to be properly placed.

Allium brevistylum Wats. Bulbs 0.8-2 cm thick, 1-4 cm long, tapering from base upward, the roots appearing lateral from a short, rhizomatous base, buried 2-10 cm, the scales minutely striate with elongate cells in vertical

rows, not fibrous-reticulate; leaves 2–5, usually shorter than the scape, linear, flat, 2–8 mm wide; scapes 15–68 cm long (above ground); spatheaceous bracts 2, connate basally, 3- to 5-veined; umbels 5- to 17-flowered, the pedicels typically curved; perianth deep rose pink (at least when dried), 10–13 mm long, subequal, the tips recurved; stamens included; ovary not crested; $2n = 14$. Aspen, lodgepole pine, spruce-fir and sedge-forb or grass-forb communities, often in moist sites, at 2285 to 3235 m in Daggett, Duchesne, Garfield, Sanpete, Sevier, Summit (type from Uinta Mts.), Uintah, and Wasatch counties; Idaho and Montana to Colorado; 39 (ii). This species has been reported for the La Sal Mts. also.

Allium cepa L. Onion. Biennial or perennial herbs (grown often as annuals) with well-developed bulbs of many shapes, colors, and sizes; leaves hollow, glaucous; umbels borne on scapes 3–10 dm tall; flowers pink to white, mostly 4–7 mm long, on pedicels to ca 25 mm long; capsules about as long as the perianth; $2n = 16, 32, 54$. Cultivated onion of gardens and commerce, widely grown in Utah; introduced from Eurasia; 3 (0).

Allium cernuum Roth Bulbs 1–2.5 cm thick, 3–9 cm long, tapering from base to ground level, the roots central or sometimes from an eccentric, subrhizomatous base, the scales typically purple or purplish, membranous, minutely striate with elongate cells in vertical rows; leaves several to many per scape, shorter than the scape, linear, flat or concave-convex, 1–6 mm wide; scapes 10–60 cm tall (above ground), abruptly recurved near the tip, the umbel nodding; spatheaceous bracts connate, membranous, fragile and soon fragmented; umbels 6- to 40-flowered, the pedicels straight or curved; perianth campanulate, 4–6 mm long, pink or white; stamens exerted; ovary strongly 6-crested; $2n = 14$. Mountain brush, sagebrush, ponderosa pine, Douglas fir, aspen, and lodgepole pine communities at 1980 to 3205 in Carbon, Daggett, Duchesne, Emery, Garfield, Grand, San Juan, Sanpete, Sevier, Uintah, and Wayne counties; British Columbia to New York, south to Mexico, Texas, and Georgia; 46 (iv).

Allium geyeri Wats. Bulbs 0.7–2 cm thick and about as long or longer, ovoid, buried 1–8 cm below ground, the scales fibrous-reticulate; leaves 2 or 3 per scape, shorter than the scape, 1–5 mm wide, concave-convex; scapes 15–50 cm tall (above ground); spatheaceous bracts 2 or 3, mostly 1-veined; umbels 5- to 37-flowered, the pedicels straight or curved; perianth pink or white, 6–10 mm long, the segments subequal, with tips more or less recurved, often replaced by bulblets; stamens included; capsule inconspicuously low-crested. Pinyon-juniper, ponderosa pine, sagebrush, aspen, grass-forb, and spruce-fir communities, typically in moist sites, at 2105 to 3540 m in Cache, Daggett, Duchesne, Emery, Garfield, Rich, San Juan, Summit, Uintah, and Wasatch counties; British Columbia and Alberta, south to Oregon, Nevada, Arizona, New Mexico, and Texas; 24 (i). A peculiar specimen from San Juan County (Welsh et al. 22371 BRY) keys to this species, but is anomalous in having many layers of fibrous reticulum and other peculiar features.

Allium macropetalum Rydb. [*A. reticulatum* var. *deserticola* Jones, type from Cisco, Grand County; *A. deserticola* (Jones) Woot. & Standl.]. Bulbs 1.2–2.5 cm thick and about as long, buried 3–15 cm below ground, the scales fibrous-reticulate, long-persistent and sometimes many layers thick; leaves typically 2, semiterete,

usually surpassing the scape, 1–3 mm wide; scapes 3–18 cm tall (above ground); spatheaceous bracts 2 or 3, mostly 3- to 5-veined; umbels 4- to 29-flowered, the pedicels often curved; perianth pink to whitish with purple midvein, the segments subequal, straight or more or less recurved; stamens included; capsule conspicuously 6-crested. Shadscale, other salt desert shrub, and pinyon-juniper communities at 1125 to 1925 m in Emery, Garfield, Grand, Kane, San Juan, and Wayne counties; Colorado, Arizona, New Mexico, and Texas; 57 (xii).

Allium nevadense Wats. [*A. cristatum* Wats., type from near St. George; *A. nevadense* ssp. *criatum* (Wats.) Ownbey]. Bulbs 0.8–1.5 cm thick and about as long, buried 3–11 cm below ground, the scales with contorted reticulations; leaf solitary (very rarely a second poorly developed), terete or nearly so, surpassing the scape, often coiled apically, mainly 2–4 mm thick; scape 2–10 cm tall (above ground); spatheaceous bracts 2 or 3, mostly 3- to 7-veined; umbels 3- to 25-flowered, the pedicels straight or curved; perianth 7–13 mm long, pink, white, or rose, the segments subequal, the tips spreading or recurved; stamens included; ovary distinctly crested, the 6 crests entire or toothed; $2n = 14$. Blackbrush, shadscale, other salt desert shrub, sagebrush, wildrye, mountain brush, and pinyon-juniper communities at 850 to 2440 m in Beaver, Box Elder, Carbon, Duchesne, Emery, Garfield, Grand, Juab, Kane, Millard, San Juan, Sanpete, Sevier, Tooele, Uintah, Washington, and Wayne counties; Oregon and Idaho to Colorado, California, Nevada, and Arizona; 71 (vii).

Allium parvum Kellogg Bulbs 1.2–2.5 cm thick and about as long, buried 5–11 cm below ground, the scales merely cellular; leaves 1 or 2 per scape, flat, 2–5 mm wide, surpassing the scape, usually strongly curved; scapes 1.5–4 cm tall (above ground); spatheaceous bracts 2, suffused with deep purple, many-veined; umbels 3- to 15-flowered, the short pedicels often recurved; perianth 7–12 cm long, white to pink or purple, with dark purple midveins, the outer often broader than the inner; stamens included; capsules with 3, low, rounded crests; $2n = 14$. Pinyon-juniper and mountain brush communities at 1675 to 2930 m in Juab and Millard counties; Oregon to California and Nevada; 5 (0). The species has been reported for Tooele County also.

Allium passeyi N. & A. Holmgren Bulbs 1–2.2 cm thick and as long or somewhat longer, buried 5–7 cm below ground, the scales fibrous-reticulate; leaves 2 or 3 per scape, flat, curved, shorter than to somewhat surpassing the scape, 3–7 mm wide; scapes 10–17 cm tall (above ground); spatheaceous bracts 2–4, usually 1-veined; umbels 8- to 27-flowered, the pedicels straight or curved; perianth segments mostly 6–9 mm long, pink to white, dimorphic, the inner ones narrower; stamens included; capsules with 3 low crests. Sagebrush community at 1460 to 1650 m in Box Elder (type from Howell Valley) County; endemic; 7 (0).

Allium schoenoprasum L. Chive. Tufted biennial or short-lived perennial herbs from poorly developed, clustered bulbs; leaves hollow, very narrow; umbels capitate on uninflated scapes 1.5–7.5 dm tall; pedicels shorter than the flowers; flowers bright rose to purplish, 7–12 mm long; capsule included in the perianth; $2n = 16, 32$. Cultivated ornamental and food plant in Utah; indigenous in Eurasia and widely grown across North America; 2 (i).

Allium textile Nels. & Macbr. Bulbs 1–2.5 cm thick and about as long, buried 3–13 cm below ground, the scales

fibrous-reticulate; leaves 2–4 per scape, concave-convex, 1–5 mm thick, shorter than to surpassing the scape; scapes 3–25 cm tall (above ground); spathaceous bracts 3, typically 1–veined; umbels 5– to 54–flowered, the pedicels straight or curved; perianth segments 5–9 mm long, white or pale pink, dimorphic; stamens included; capsules with tiny crests toward the style; $2n = 14$. Shadscale, mat-saltbush, other salt desert shrub, sagebrush, and pinyon-juniper communities at 1430 to 2290 m in Carbon, Daggett, Duchesne, Emery, Garfield, Grand, and Uintah counties; Alberta and Saskatchewan to Nevada and New Mexico; 50 (viii).

Androstephium Torr.

Perennial herbs from fibrous-reticulate cormous bulbs; leaves linear, channeled; flowers inconspicuous, though relatively large, pedicellate, borne in umbels, these subtended by spathaceous bracts; sepals 3, petaloid; petals 3, petaloid, united below and adnate to the sepals; stamens 6, the filaments united, with bifid lobes between the basifixed anthers; ovary 3–loculed, several-ovuled, sessile; seeds flat.

Androstephium breviflorum Wats. [*Brodiaea breviflora* (Wats.) Macbr.; *B. paysonii* A. Nels.]. Bulbs 1–3.5 cm thick and about as long, buried 3–9 cm below ground, the scales fibrous-reticulate; leaves 1–3 per scape, linear, surpassing the scapes or subequal to them, usually straight or only somewhat curved; spathaceous bracts connate basally, usually 5–veined; umbels 3– to 8–flowered, the pedicels typically straight; perianth 12–21 mm long, a dirty greenish or purplish white, with the midvein often blue purple, the segments connate ca 1/3 of the length; stamens included; capsules 10–15 mm long and about as broad, 3–lobed; seeds 7–9 mm long, black. Creosote bush, Joshua tree, blackbrush, salt desert shrub, sagebrush, and pinyon-juniper communities at 820 to 1985 m in Beaver, Carbon, Daggett, Duchesne, Emery, Garfield, Grand, Iron, Juab, Kane (type from near Kanab), Millard, San Juan, Sevier, Uintah, Utah, Washington, and Wayne counties; Nevada, Arizona, and Colorado; 87 (xvii).

Asparagus L.

Perennial herbs from elongate tuberous roots; stems erect, diffusely branched; leaves alternate, scalelike, subtending flattened, photosynthetic phyllodia; flowers perfect or functionally dioecious, borne in pairs along the stem; pedicels jointed; sepals 3; petals 3, distinct or nearly so; stamens 6; ovary 3–loculed, with 2 or few ovules per locule; berries globose.

Asparagus officinalis L. *Asparagus*. Plants mainly 10–20 dm tall; stems glaucous; leaves scalelike; phyllodia 3–20 mm long, linear-filiform; flowers pendulous, the pedicels filiform, jointed, 4–20 mm long; perianth campanulate, greenish white, 4–7 mm long; berries red, 5–8 mm thick. Cultivated food plant, escaping and established along canal banks, in orchards, and among indigenous, riparian vegetation at 760 to 1895 m in lower elevation sites in much of Utah; introduced from Eurasia; 24 (iv).

Calochortus Pursh

Perennial herbs from tunicate bulbs; stems leafy, erect or sprawling, straight or flexuous, often with axillary

bulbs below ground level; leaves alternate, linear to narrowly attenuate, reduced upwards; bracts opposite to subopposite or alternate; flowers showy, solitary or 2–6 in an umbellate or racemose cluster, erect; perianth dimorphic, the sepals more slender and differing in color and texture, the petals more brightly colored and glandular near the base, the area around the bearded gland variously yellow and/or purple striped or mottled and often variously bearded; stamens 6, the anthers basifixed; ovary 3–loculed; capsules 3–angled, septicidal; seeds numerous, flattened.

Ownbey, M. A. 1940. A monograph of the genus *Calochortus*. Ann. Missouri Bot. Gard. 27: 371–560.

Reveal, J. L. 1977. *Calochortus*. pp. 496–504. In: Cronquist, A. et al. Intermountain Flora. Vol. 6. Columbia Univ. Press, New York.

1. Flowers yellow or yellow orange 2
- Flowers white to cream or lavender to purplish 3
- 2(1). Base of petals with a field of purplish black surrounding the gland, the dark field extending to petal margins; petals golden yellow to yellow orange; plants evidently rare *C. kennedyi*
- Base of petals not wholly purplish black, mainly with a purple crescent or inverted "V" above the gland; petals bright yellow; plants locally common in southern Utah *C. aureus*
- 3(1). Stems soon sprawling and flexuous; flowers 1–6 in a flexuous raceme, purplish; glands surficial, not surrounded by a membrane; plants of southern Utah *C. flexuosus*
- Stems erect; flowers mostly 1–4 (6) in an umbellate cluster, variously colored; glands depressed and surrounded by a membrane 4
- 4(3). Petals usually 2–3 times longer than broad, with a longitudinal greenish median; plants uncommon in western and northern Utah *C. bruneauensis*
- Petals usually 1–2 times longer than broad, the median sometimes faintly purplish but not usually green; plants diverse in abundance and distribution 5
- 5(4). Anthers acute; petal base with a broad purple band above the gland extending across the width; plants of eastern Utah *C. gunnisonii*
- Anthers obtuse; petal base with a purple inverted "V" or crescent above the gland (typically separated by a yellow stripe), the purple marking not extending to the blade margins 6
- 6(5). Gland on petal circular, shield-shaped, or longitudinally elongate; petal hairs simple, not branched or enlarged apically; plants common and widespread *C. nuttallii*
- Gland on petal transversely oval in outline; petal hairs bilobed or conspicuously enlarged apically; plants of Washington County *C. ambiguus*

Calochortus ambiguus (Jones) Ownbey [*C. watsonii* var. *ambiguus* Jones]. Plants erect; stems 1–5 dm tall, usually simple; leaves several, alternate; bracts narrowly lance-attenuate, opposite or subopposite, 3–8 cm long; flowers 1–4; sepals lanceolate, subequal to or shorter than the petals; petals 3–4.5 cm long, rounded to obtuse or abruptly acuminate, the base with a transversely oval gland, this depressed, fringed, and densely hairy, surrounded by yellow and this topped by a purple stripe, otherwise white; anthers pinkish to maroon, obtuse; capsules narrowly oblong, 3–angled, 4–7 cm long. Mountain

brush at ca 1525 m in Washington County; Arizona and New Mexico; 1 (0).

Calochortus aureus Wats. [*C. nuttallii* var. *aureus* (Wats.) Ownbey]. Plants erect; bulbs often with very shaggy, persistent scales; stems 9–35 cm tall (above ground), simple or rarely branched; leaves typically 3, alternate; bracts lance-attenuate to lanceolate, opposite (or whorled), 1.6–8 cm long; flowers 1–5; sepals elliptic to oblong, shorter than the petals, somewhat suffused with yellow green and longitudinally veined dorsally, yellowish and often with a purple blotch above the base ventrally; petals golden yellow, 2.8–4.5 cm long, truncate-rounded to abruptly short-apiculate apically, the base with a subcircular gland, this depressed and densely hairy, surrounded by yellow and overtopped by a narrow to broad purple crescent, sometimes with a purple blotch below as well, and often with scattered long hairs outward from the gland; anthers cream to yellow, obtuse; capsules 3–5 cm long, 3-angled, ellipsoid. Blackbrush, shadscale, other salt desert shrub, and juniper communities at 1250 to 1770 m in Garfield, Kane (type from near Kanab), San Juan, Washington, and Wayne counties; Arizona (a Colorado Plateau endemic); 24 (iii).

Calochortus bruneanus Nels. & Macbr. [*C. nuttallii* var. *bruneanus* (Nels. & Macbr.) Ownbey]. Plants erect; stems 12–40 cm tall (above ground), simple; leaves 2 or 3, alternate; bracts opposite, linear from a clasping base, 1.5–6 cm long; flowers 1 or 2; sepals narrowly lanceolate, shorter than or subequal to the petals, greenish dorsally, whitish to pale lavender ventrally and often with a purple crescent above the base; petals 2–3 (4) cm long, obtuse to short-acuminate apically, more than twice longer than broad, whitish to pale lavender and with a median longitudinal greenish stripe, the base with a subcircular to elongate gland, this depressed and densely hairy, surrounded by yellow and often purple-blotched above and below, the surface away from the gland somewhat long-hairy as well; anthers purple, obtuse; capsules ellipsoid, 3–6 cm long, 3-angled. Sagebrush, grass, pinyon-juniper, white fir, and aspen communities at 2135 to 2900 m in Box Elder, Juab, and Rich counties; Idaho and Montana, south to California and Nevada; 5 (ii).

Calochortus flexuosus Wats. Plants decumbent, sprawling, or less commonly erect; stems 8–50 (60) cm long or more, flexuous or sinuous, often branched; leaves 1 or few, often coiled on the ground surface; bracts subopposite to alternate, lance-attenuate to linear-subulate; flowers 1–8; sepals ovate-elliptic to elliptic, much shorter than the petals, greenish externally, purplish and with yellowish and purplish markings above the base ventrally; petals 2.2–4.5 cm long, truncate to broadly rounded apically, somewhat longer than broad, purplish to lavender, the base with a transversely elliptic to crescent-shaped gland, this not depressed or with a surrounding membrane, densely hairy, surrounded by yellow or yellow orange and with bordering purple blotches, often with scattered hairs away from the gland; anthers purplish to cream, obtuse; capsules 2.5–3.5 cm long, 3-angled. Creosote bush, Joshua tree, other warm desert shrub, blackbrush, shadscale, other salt desert shrub, and pinyon-juniper communities at 885 to 2015 m in Beaver, Garfield, Kane (type from near Kanab), Millard, San Juan, and Washington counties; Colorado, New Mexico, Arizona, Nevada, and California; 43 (vii).

Calochortus gunnisonii Wats. Plants erect; stems

20–60 cm tall (above ground), simple; leaves 2–4, alternate; bracts subopposite, lance-linear to lance-attenuate; flowers 1–4; sepals lanceolate, shorter than the petals, greenish and many-veined dorsally, pale lavender to purplish ventrally, typically with a pair of purple blotches above the base; petals 2.7–4.1 cm long, truncate to broadly rounded or obtusish apically, only somewhat longer than broad, purplish to lavender, the base with a transverse, elongate, densely hairy gland, this typically bordered by purple on one or both sides, the purple banding extending to the petal margins, also typically hairy away from the gland with bulbous or bifid tipped long hairs; anthers purplish to cream, acute to apiculate; capsules ellipsoid, 3-angled, 3–5 cm long. Sagebrush, pinyon-juniper, mountain brush, and aspen communities at 2375 to 2900 m in Carbon, Duchesne, Grand, San Juan, and Uintah counties; Montana and South Dakota, south to Arizona and New Mexico; 10 (ii).

Calochortus kennedyi T. C. Porter Plants erect; stems mainly 1–4 dm tall, simple; leaves 2–4, alternate; bracts subopposite, 1.5–6 cm long, lance-attenuate to lance-linear; flowers 1 or 2; sepals lanceolate, shorter than the petals, greenish to purplish dorsally, pale and subbasally blotched with purple ventrally; petals 3–3.7 cm long, truncate to broadly rounded apically, somewhat longer than broad, yellow orange to bright orange, the base with a circular, depressed, densely hairy gland in a field of purple extending to the petal edges, and often with additional long hairs away from the gland; anthers pinkish to purple, abruptly apiculate; capsules not seen. Two specimens belonging to this species were collected in “foothills” at Kanab, Kane County (Snow sn 1925 BRY); Arizona, Nevada, and California; 2 (0). A specimen from Wire Mesa in Washington County, tentatively identified as *C. aureus*, approaches this species.

Calochortus nuttallii T. & G. in Beckwith Sego Lily. [*C. luteus* Nutt.; *C. watsonii* Jones; *C. rhodotheucus* Clokey]. Plants erect; stems 8–50 cm tall (above ground), simple; leaves typically 3, alternate; bracts subopposite, 1.5–9 cm long, lance-attenuate to lance-linear; flowers 1–5; sepals lanceolate to ovate, variously greenish to purplish externally, pale within and often blotched with yellow and or purple above the base; petals 2.5–6.3 cm long, truncate-rounded to obtuse or abruptly acuminate apically, 1–2 times longer than broad, white, cream, or lavender (fading purple), the base with a circular, shield-shaped, or longitudinally elongate, depressed, densely hairy gland in a field of yellow often bordered by a crescent or inverted V-shaped stripe or blotch of purple, the outer surface sometimes with a median purplish stripe; anthers cream to pink or purplish, obtuse; capsules 3–5 cm long, lance-ellipsoid, 3-angled. Shadscale, greasewood, other salt desert shrub, sagebrush, pinyon-juniper, mountain brush, ponderosa pine, and aspen communities at 1005 to 3050 m in all Utah counties; Idaho to North Dakota, south to Nevada, Arizona, New Mexico, and Nebraska; 175 (xvii). This beautiful plant is the state flower of Utah.

Camassia Lindl.

Perennial scapose herbs from tunicate bulbs; leaves basal, 3 to several; flowers several to many, borne in bracteate racemes; perianth segments 6, alike in color and texture, distinct; stamens 6, inserted on the receptacle; anthers versatile; ovary superior, 3-lobed; style 1, the stigma 3-lobed; capsules loculicidal.

Gould, F. W. 1942. A systematic treatment of the genus *Camassia* Lindl. Amer. Midl. Naturalist 28: 712-742.

Camassia quamash (Pursh) Greene Camas. [*Phalangium quamash* Pursh; *C. quamash* ssp. *utahense* Gould, type from Blacksmith Canyon, Cache County]. Plants erect, mainly 3-7 dm tall; leaves flat, shorter than the inflorescence, 1-4 dm long, 0.6-2 cm wide, 3-6 from the stem base; racemes 0.8-2.5 dm long; pedicels jointed, 0.7-2 cm long; perianth blue (or white), the segments 1.5-3 cm long; stamens with slender filaments, the anthers yellow or blue; capsules 1-2 cm long. Sagebrush, mountain brush, aspen, and grass-forb communities, often where wet in springtime, at 1890 to 2410 m in Box Elder, Cache, Davis, Summit, Wasatch, and Weber counties; British Columbia and Alberta, south to California and Wyoming; 18 (i). Recognition of infraspecific taxa among the Utah materials seems moot. This plant was important as a food staple for the Indians of the Pacific Northwest.

Chionodoxa Boiss.

Perennial bulbous scapose herbs; leaves basal, usually 2 per scape; flowers erect, solitary or 2 or 3 in a raceme; perianth lobes rotate, the 6 segments connate at the base, forming a campanulate tube; stamens 6, inserted at the base of the tube, the anthers dorsifixed; capsule loculicidal, few-seeded.

Chionodoxa luciliae Boiss. Glory-of-the snow. Plants erect, from bulbs mainly 2-9 cm below ground; scapes 4-12 cm tall above ground; leaves usually 2 per scape, linear, 2-7 mm wide, subequal to or shorter than the scape; flowers 1-3, in minutely bracteate racemes; perianth blue with a white center, 12-22 mm long, the segments connate in the lower 1/4; stamens exerted beyond the tube, the filaments broad. Cultivated ornamental, persisting and rarely escaping in lower elevation portions of Utah; introduced from Asia Minor; 4 (i).

Colchicum L.

Perennial tunicate cormous herbs; flowers in umbellate, subsessile clusters, arising below ground; perianth 6-lobed, united basally into a long, pedicellate tube; stamens 6, inserted near the base of the segments; anthers versatile; ovary subterranean, the styles 3; capsule septicidal; seeds numerous.

Colchicum autumnale L. Corms 2.5-6 cm long and 2-4 cm thick or more, ovoid to subglobose, the prolonged tunicate scales dark brown, leathery; leaves developed in springtime, 3-5, mostly 1-3.5 dm long and 2-7 cm wide, glabrous; flowers 1-10 (or more), the perianth segments oblong to elliptic or obovate, 2-6 cm long and 8-15 mm wide, pink, appearing in autumn; staminal filaments 10-15 mm long; anthers 5-8 mm long, yellow; styles curved apically, with decurrent stigmas; capsules maturing at or near ground level. Uncommonly grown ornamental herbs, long persisting in lower elevation portions of Utah; introduced from Europe; 2 (i).

Convallaria L.

Perennial rhizomatous herbs; leaves with convolute, sheathing bases, simulating a stem with alternate leaves, each such aggregation consisting of ca 5 bladeless, membranous scales and 1-3 green foliage leaves; scapes arising from the clustered, membranous blades; leaves, usually

appearing prior to the foliage leaves; flowers white, borne in racemes, deflexed; perianth campanulate, 6-lobed, connate to above the middle; stamens 6; anthers attached near the base; style 1; fruit a berry.

Convallaria majalis L. Lily-of-the-valley. Plants 10-30 cm tall, the scapes with purplish, membranous, sheathing scales; foliage leaves with sheaths mainly 5-20 cm long, the blades 5-20 cm long and 2-10 cm wide, elliptic to lanceolate, acute to acuminate; flowers fragrant, nodding; perianth 5-10 mm long, white; fruit red; $2n = 38$. Commonly grown ornamental plants, long persisting at lower elevations in Utah; introduced from Europe; 1 (0). The plants are noted for their medicinally active components.

Dichelostemma Kunth

Plants scapose perennial herbs from fibrous-reticulate bulbous corms; leaves 2, basal, linear; flowers lilac to blue, borne in umbellate to subcapitate clusters, subtended by membranous bracts; perianth segments 6, similar in color and texture, connate at the base; stamens 6, dimorphic, adnate to the perianth; anthers basifixed; ovary 3-loculed, few-ovuled; capsule loculicidal.

Dichelostemma pulchellum (Salisb.) Heller [*Hookera pulchella* Salisb.; *Brodiaea pulchella* (Salisb.) Greene; *B. capitata* Benth.]. Plants erect from bulbs 4-12 cm below ground; leaves 2, linear, shorter than to surpassing the scape, straight or curved; scapes mainly 3-9 dm tall above ground; spatheaceous bracts distinct, usually several-veined; umbels 3- to 10-flowered, the pedicels often shorter than the flowers; perianth blue to lilac, 14-18 mm long, the segments connate ca 1/3 the length; stamens included; capsules 4-6 mm long, 3-lobed; seeds 2.5-4 mm long. Creosote bush, Joshua tree (other warm desert shrub), pinyon-juniper, mountain brush, and ponderosa pine communities at 850 to 2600 m in Iron, Kane, and Washington counties; California, Nevada, Arizona, and New Mexico; 27 (iii).

Disporum Salisb. ex D. Don

Perennial herbs from rhizomes; stems simple or dichotomously branched, typically flexuous; leaves alternate, ovate to lanceolate or elliptic, sessile and somewhat cordate-clasping; flowers white to greenish, solitary or in terminal, umbellate pairs, nodding on slender recurved pedicels; perianth segments 6, alike, connate near the base; stamens 6, inserted on base of the perianth; anthers subversatile; ovary 3-loculed, with 2-6 ovules per locule; style 1, with 3 stigmatic lobes; berries yellowish to red; seeds subglobose.

Jones, Q. 1951. A cytotoxic study of the genus *Disporum* in North America. Contr. Gray Herb. 173: 1-39.

Disporum trachycarpum (Wats.) Benth. & Hook. Fairybells. [*Prosartes trachycarpa* Wats., type from Parleys Park, Summit County]. Plants erect or with spreading branches, mainly 2-6 dm tall; leaves 3-10 cm long, 1.2-9 cm wide, ovate to lanceolate or elliptic, ciliate; flowers 1 or 2, white to greenish, 10-15 mm long, campanulate; stamens subequal to the perianth or somewhat longer; ovary papillate; berries yellowish to red, 7-13 mm wide, strongly papillate; $2n = 22$. Mountain brush, Douglas fir-white fir, ponderosa pine, limber pine, and spruce-fir communities at 1250 to 2990 m in Beaver, Box Elder, Cache, Carbon, Duchesne, Iron, Juab, Millard,

Salt Lake, San Juan, Sanpete, Sevier, Summit, Tooele, Uintah, Utah, Wasatch, Washington, and Weber counties; British Columbia to Manitoba, south to Arizona and New Mexico; 34 (iii).

Eremocrinum Jones

Perennial scapose herbs from short stout rhizomes and fleshy yellowish roots; leaves 3–8 or more, the bases membranous-sheathing, persistent and ultimately fibrous; flowers white to greenish, borne in racemes or in contracted panicles; perianth segments 6, alike, connate and pedicel-like at the base; stamens 6, inserted at the ovary base, the anthers basifixed; ovary 3-loculed, with few ovules; style 1, the stigma discoid; capsules loculicidal, 3-lobed, reticulately veined.

Eremocrinum albomarginatum (Jones) Jones [*Hesperanthes albomarginata* Jones, type from near Green River]. Plants mainly 1–3.5 dm tall above ground, erect, arising from a fibrous-sheathed base terminating a short thickened rhizome and thickened yellowish roots; leaves linear, often surpassing the scapes, but commonly coiled or reclining on the ground; flowers 0.8–1.5 cm long, subtended by membranous, ovate-attenuate, white bracts; stamens included; capsules 4–6 mm long; seeds black, 2–3 mm long. Blackbrush, Vanclevea, sand sagebrush, purple sage, ephedra, ricegrass-galleta, shadscale, and other sand and salt desert shrub communities at 1125 to 1895 m in Emery, Garfield, Grand, Kane, San Juan, and Wayne counties; Arizona (a Colorado Plateau endemic); 32 (vii).

Erythronium L.

Perennial, scapose or subscapose herbs from elongate bulbous corms; leaves 2, basal, elliptic to oblong or lanceolate to oblanceolate; flowers yellow, solitary or 2–5 in loose racemes; perianth segments 6, similar in color and texture, distinct; stamens 6, in 2 unequal sets, borne on the receptacle; anthers basifixed; ovary 3-loculed, several-ovuled; style 1, 3-lobed apically; capsules loculicidal.

Applegate, E. I. 1935. The genus *Erythronium*: A taxonomic and distributional study of the western North American species. Madrono 3: 58–113.

Erythronium grandiflorum Pursh Dogtooth-violet. [*E. utahense* Rydb., type from Great Salt Lake]. Bulbous corms mainly 1–2 cm thick, tapering to the stem exertion, 2.5–8 cm long, the scales cellular-membranous, buried 8–19 cm below ground; leaves 2, the blades 8–20 cm long, 1–5 cm wide, lanceolate to elliptic, oblong, or oblanceolate; flowers solitary or usually 2 or 3 in a bractless raceme; pedicels 2–12 cm long (or more) and recurved subapically in flower, even longer and erect in fruit; perianth segments 2–3.5 cm long, 3–7 mm wide, narrowly lanceolate, spreading to reflexed at anthesis; stamens exerted; anthers 6–12 mm long, reddish or purplish; capsules ellipsoid to obovoid, 2–4 (6) cm long. Mountain brush, sagebrush, aspen, lodgepole pine, and spruce-fir communities at 1675 to 3115 m in Box Elder, Cache, Davis, Duchesne, Emery, Juab, Millard, Morgan, Salt Lake, Sanpete, Sevier, Summit, Tooele, Utah, Wasatch, and Weber counties; British Columbia and Alberta, south to California and Colorado; 74 (v).

Fritillaria L.

Plants perennial glabrous subscapose or caulescent herbs from bulbs and with usually numerous reduced bulblets; leaves alternate or the lower ones subopposite or some almost or quite whorled; flowers yellow to brownish purple and often mottled, usually nodding, campanulate to subrotate, solitary or 2–7 in terminal, bracteate racemes; perianth segments 6, subequal, distinct; stamens 6, inserted on the receptacle; anthers subsversatile; ovary 3-loculed, with numerous ovules; capsule 6-angled or -winged, loculicidal.

Beetle, D. E. 1944. A monograph of the North American species of *Fritillaria*. Madrono 7: 133–159.

1. Flowers yellow, narrowly campanulate, sometimes fading purple; style 1 *F. pudica*
- Flowers brownish purple, mottled, or sometimes yellow with purplish mottlings; styles 3 *F. atropurpurea*

Fritillaria atropurpurea Nutt. Leopard-lily. Plants erect, mainly 1.2–4.5 dm tall above ground, arising from bulbs 2–15 cm below ground; stems leafless for 2–25 cm above ground; leaves numerous, linear, 3–12 cm long, 1.5–7 mm wide; flowers 1–7, borne on recurved pedicels, rotate-campanulate; perianth segments brownish purple to yellowish, mottled, 10–25 mm long, ovate to lanceolate or elliptic; anthers 2–4 mm long; styles connate only at the base; capsules barrel-shaped, 10–22 mm long and about as broad, with 6 entire, acutely angled ridges. Shadscale, pinyon-juniper, mountain brush, sagebrush, white fir, Douglas fir, aspen, and spruce-fir communities at 1645 to 3205 m in most Utah counties (except Carbon, Emery, Grand, and Sanpete); Oregon to North Dakota, south to California, Nevada, Arizona, and New Mexico; 79 (v).

Fritillaria pudica (Pursh) Sprengel Yellow-bell. [*Lilium pudicum* Pursh; *F. lucella* Gand., *F. dichroa* Gand., *F. utahensis* Gand., types of the three latter names are from Cache County]. Plants erect, mainly 6–15 cm tall above ground, arising from bulbs 2–12 cm below ground; stems with leaves almost or quite at ground level, 2 to many, linear to narrowly oblong or elliptic, 3–15 cm long, 2–14 mm wide; flowers solitary or less commonly 2 or 3, borne on recurved bractless pedicels (or peduncles) mainly 3–10 cm long; perianth segments bright yellow or streaked with purple, sometimes fading purple, narrowly campanulate, 12–22 mm long, 4–10 mm wide; style 1, with a discoid stigma; capsules erect, 15–30 mm long and 12–20 mm wide or more, seldom collected. Sagebrush and mountain brush communities at 1525 to 2565 m in Box Elder, Cache, Davis, Juab, Morgan, Salt Lake, Summit, Tooele, Utah, and Weber counties; British Columbia and Alberta, south to California, Nevada, and Colorado; 23 (0).

Hemerocallis L.

Plants perennial scapose herbs from short coarse rhizomes; leaves basal, linear, keeled; flowers yellow, orange, or reddish, large and showy, ascending-spreading, few to many, borne in bracteate racemes or panicles; perianth segments 6, more or less dimorphic, united into a long pedicel-like base; stamens 6, long-exserted, inserted on the segments; anthers subsversatile; ovary 3-loculed; style long, slender; capsules loculicidal, few-seeded.

Hemerocallis fulva (L.) L. Day-lily. Plants mainly 8–12 dm tall, forming clumps; leaves basal, linear, typically 2–5 dm long and 15–30 mm wide, narrowly elliptic to linear; flowers large and showy, short-pedunculate, but with a pedicellate, connate base enclosing the ovary, the perianth expanded and more or less funnellform above the base, yellow, orange, reddish, and often variously striped, the segments 5–9 cm long beyond the throat; staminal filaments often curved to one side and appearing irregular; capsules seldom formed; $2n = 22, 33, 36$. Commonly cultivated ornamentals, long persisting and escaping at lower elevations in of Utah; introduced from Eurasia; 6 (i). Our plants are variable in flower color and size, and might involve horticultural selections of hybrids between this and other species in the genus. The lack of fruit suggests that our material might consist of at least partially sterile triploids.

Hyacinthus L.

Perennial scapose herbs from tunicate bulbs; leaves few to numerous, basal, linear to oblong, flowers in minutely bracteate racemes; perianth funnellform to campanulate, the segments united to near the middle, the lobes spreading to reflexed; stamens 6, inserted on the perianth base; anthers versatile; ovary 3-loculed; style 1, the stigma capitate; capsules loculicidal.

Hyacinthus orientalis L. Common Hyacinth. Bulbs 3–6 cm thick or more, the outer scales cellular-membranous; scapes 6–30 cm tall above ground; leaves 15–30 cm long or more, mostly 1–3 cm wide, subequal to or shorter than the scapes at anthesis; racemes few- to many-flowered; pedicels 1–8 mm long, subtended by membranous bracts; flowers 2–3 cm long, blue, purple, red, yellow, or white, fragrant; capsules seldom produced; $2n = 16$. Commonly cultivated ornamental herbs, long persisting and occasionally escaping in Utah; introduced from Asia Minor; 3 (i). This traditional ornamental marks spring with its brightly colored flowers and permeating odor.

Leucocrinum Nutt. ex. Gray

Perennial acaulescent herbs from short stout rhizomes and fleshy grayish to tan roots; leaves 4–8 (or more), the bases membranous-sheathing, persistent but not especially fibrous; flowers white, arising in subumbellate clusters from below ground; perianth segments 6, united into a long pedicellate tube basally, the lobes spreading; stamens 6, the filaments inserted on the perianth tube, subversatile; ovary 3-loculed; styles slender, 3-lobed; capsule loculicidal.

Leucocrinum montanum Nutt. ex Gray Star-lily. Plants caespitose, mainly less than 1 dm tall; leaves linear, mainly 3–20 cm long, 1.5–6 mm wide, the sheathing bladeless bases 3–8 cm long; flowers white, few to several, mostly 5–12 cm long, arising from subterranean pedicels; anthers 4–6 mm long, often coiled or curved; capsules formed below ground, 5–8 mm long; seeds 3–4 mm long; $2n = 11, 13, 14$. Sagebrush, pinyon-juniper, and ponderosa pine communities at 1800 to 2290 m in Garfield, Iron, Kane, and Washington (?) counties; Oregon to Montana, south to California, Nevada, and New Mexico; 11 (0).

Lilium L.

Perennial caulescent herbs from scaly bulbs or short rhizomes; leaves alternate or whorled, sessile; flowers

showy, white to orange or red and typically spotted, nodding to erect, funnellform to campanulate, solitary or few to several in leafy-bracted racemes, or subumbellate; perianth segments 6, similar, distinct, each with a nectary gland near the base; stamens 6, borne on the receptacle, the anthers versatile; ovary 3-loculed; style slender, 3-lobed; capsule loculicidal.

1. Flowers white, funnellform, the segments reflexed only at the tips *L. longiflorum*
- Flowers orange to yellow orange, and usually spotted, campanulate, often reflexed below the tips *L. bulbiferum*

Lilium bulbiferum L. Bulbs white, subglobose, 5–8 mm thick; stems 5–12 dm tall, floccose at the nodes and along the stem upward; leaves mainly 6–10 cm long, 6–18 mm wide, lanceolate to narrowly elliptic, often bulbiferous in the upper axils; pedicels 2–5 cm long, spreading; flowers yellow to orange, spotted with brown purple, 1–4, opening widely, the segments 5–10 cm long; staminal filaments straight to curved, but not divaricate, the anthers brownish; styles much longer than the ovary; capsules 2.5–4 cm long; $2n = 24$. Cultivated ornamental, persisting in lower elevation portions of the state; introduced from Europe; 3 (ii). Our material is more or less intermediate to *L. maculatum* Thunb.

Lilium longiflorum Thunb. White-trumpet Lily; Easter Lily. Bulbs white, subglobose, 2–5 cm thick; stems 5–8 (10) dm tall, glabrous, green or reddish below; leaves mainly 10–18 cm long, narrowly lanceolate to elliptic, acuminate, not bulbiferous in the axils; flowers white, 1 to few (several), slender, 10–18 cm long, flaring apically, fragrant; staminal filaments straight; style long, slender. Common greenhouse and garden ornamental, which persists at lower elevations in of Utah; introduced from Japan; 1 (i).

Lloydia Salisb.

Perennial bulbous herbs, arising from rhizomes; stems erect, leafy, the leaves reduced upward, arising from a basal, usually sheathing cluster of marcescent leaf bases; flowers 1 to few, in a terminal raceme; perianth segments 6, distinct, each with a transverse gland at the base; stamens 6; pistil 1, with a single style, the stigma 3-lobed; fruit a 3-loculed, loculicidal capsule.

Lloydia serotina (L.) Wats. Alp Lily. [*Bulbocodium serotinum* L.]. Plants erect, 5–15 (20) cm tall; bulbs small, clothed with a brownish coat; stems slender; basal leaves 2–8 cm long, mostly 1–2 mm wide; cauline leaves alternate, reduced upward, 1–4 cm long; flowers creamy white, 8–13 mm long, the segments purple-veined and tinged with rose on back; capsules ovoid, ca 8 mm long; $2n = 24, 36, 48$. Alpine tundra and krummholz at 2288 to 3815 m in Daggett, Duchesne, Salt Lake, Summit, and Uintah counties; Alaska and Yukon, south to Washington, Nevada, and Colorado; Eurasia; 10 (ii).

Muscari Miller

Perennial herbs from a truncate bulb; leaves few to several, linear; flowers small, numerous, borne in terminal racemes (rarely paniculate), nodding, typically blue, the apical ones commonly sterile, the lower ones fertile; bracts of pedicels small; perianth connate, urn-shaped, the 6 segments recurved only apically; stamens 6, inserted on the perianth; anthers versatile; pistil 3-loculed, sessile, the style filiform, short; capsules 3-angled, loculicidal.

Muscari botyroides (L.) Miller Grape Hyacinth. [*Hya-cynthus botyroides* L.]. Plants scapose, erect, 10–35 cm tall; bulbs ovoid, clothed with membranous scales; leaves all basal, 10–40 cm long; flowers blue purple, ovoid, 5–6 mm long, borne in more or less compact racemes; capsules ovoid; $2n = 18, 36$. Commonly cultivated ornamental in Utah; escaping and persisting; introduced from Europe; 5 (ii).

Ornithogalum L.

Bulbous perennial herbs; leaves all basal; flowers white to greenish, borne in bracteate, scapose, corymbose racemes; perianth segments 6, distinct or connate at the base only; stamens 6, the filaments broadly expanded, membranous; anthers subversatile; fruit a loculicidal capsule.

Ornithogalum umbellatum L. Bulb surrounded by tufts of leaves arising from offsets; leaves 10–40 cm long or more, 2–8 mm wide; scape glabrous, subequal to the leaves or shorter; bracts membranous or the tips herbaceous, subequal to or shorter than the pedicels; flowers few to numerous; perianth segments 15–22 mm long, lanceolate to oblong-lanceolate or -oblanceolate, white with a green stripe; ovary ovoid to subcylindric, longer than the style; $2n = 18, 27, 28, 35, 36, 44, 45, 52, 54, 77, 90, 108$. Introduced ornamental, escaping and established in Salt Lake and Utah counties; introduced from Europe; 2 (0).

Scilla L.

Bulbous, scapose, perennial herbs; leaves all basal; flowers blue or purple, solitary or racemose, nodding; bracts reduced; perianth segments distinct; stamens 6, the filaments distinct, subulate; anthers subversatile; fruit a subglobose, 3-lobed capsule.

Scilla sibirica Haw. in Andrews Squill. Bulbs ovoid, whitish beneath dark outer scales; leaves 2–4, mainly 6–20 cm long, 10–20 mm wide, scapes 10–25 cm long, subequal to the leaves; pedicels usually shorter than the perianth; flowers 1–5, nodding; bracts 1–1.5 mm long; perianth segments 12–15 mm long, deep blue; $2n = 12, 18, 30$. Cultivated spring-flowering ornamental, persisting at lower elevations in Utah; introduced from U.S.S.R.; 2 (ii).

Smilacina Desf.

Rhizomatous perennial herbs; stems erect or ascending, simple; leaves alternate, many-nerved, sessile or somewhat clasping; flowers in terminal racemes or panicles; perianth 6-segmented, white or greenish white, distinct or nearly so; stamens 6; ovary 3-lobed; style short; stigma typically 3-lobed; fruit a globose berry.

1. Flowers in panicles; perianth segments ca 2 mm long *S. racemosa*
- Flowers in racemes; perianth segments 4–7 mm long *S. stellata*

Smilacina racemosa (L.) Desf. False Solomon-seal. [*Convallaria racemosa* L.; *S. amplexifolius* Nutt.]. Stems 3–10 dm tall from fleshy rhizomes; leaves 5–9 or more per stem, oblong-lanceolate, sessile or short-petioled, 7–20 cm long, pubescent below with short stiff hairs, the margins minutely ciliate; panicle densely many flowered, 4–10 cm long; perianth segments ca 2 mm long; fruit

mottled, becoming red at maturity, 4–6 mm in diameter; $2n = 36, 72$. Mountain brush, pinyon-juniper, Douglas fir, limber pine, aspen, and spruce-fir communities at 1370 to 3235 m in Box Elder, Cache, Carbon, Davis, Duchesne, Grand, Juab, Salt Lake, San Juan, Sanpete, Sevier, Summit, Uintah, Utah, Wasatch, Washington, and Weber counties; widely distributed in North America; 50 (iii).

Smilacina stellata (L.) Desf. [*Convallaria stellata* L.]. Stems 3–5 dm tall or more, from a slender rhizome; leaves 5–9 or more per stem, sessile, pubescent to glabrous beneath, lanceolate, 5–15 cm long, 2–4 cm wide; racemes 3–7 cm long, several-flowered; perianth segments 4–7 mm long; berries mottled, becoming red at maturity, 7–10 mm in diameter; $2n = 36$. Hanging garden, pinyon-juniper, sagebrush, mountain brush, ponderosa pine, aspen, lodgepole pine, bristlecone pine, and spruce-fir communities at 1125 to 3115 m in all Utah counties; widespread in North America; 156 (xv).

Streptopus Michx.

Rhizomatous perennial herbs with leafy branching or simple stems; leaves alternate, thin, many-nerved, sessile or auriculate-clasping; flowers solitary or in pairs, borne laterally on the stem from the upper leaf axils; perianth campanulate, yellowish white (rarely pinkish), the tips at length spreading, 6-segmented; stamens 6; pistil 1, the ovary 3-lobed; fruit a red berry.

Streptopus amplexifolius (L.) DC. Cucumber-root; Clasping twisted-stalk. [*Uvularia amplexifolia* L.]. Plants with stems usually branched, 3–10 dm tall; leaves several, auriculate-clasping, ovate-lanceolate, 5–15 cm long, 2.5–5 cm wide; peduncles 1–5 cm long, 1- or 2-flowered; perianth 8–12 mm long, the segments recurved or spreading apically; stigma entire; fruit ovoid-ellipsoid, yellowish white to red, 10–18 mm long; $2n = 32$. Aspen, lodgepole pine, and spruce-fir communities at 2135 to 3235 m in Beaver, Cache, Daggett, Duchesne, Garfield, Grand, Piute, Salt Lake, San Juan, Sevier, Summit, Uintah, and Wasatch counties; widespread in North America; Eurasia; 19 (vi). Our material belongs to var. *chalezatus* Fassett. The berries are reported to be edible, and have been used in making preserves.

Triteleia Dougl. ex Lindl.

Plants scapose perennials from fibrous-reticulate bulbs; leaves 1 or 2, basal, linear; flowers blue or white, borne in umbellate clusters, subtended by a papery involucre of separate bracts; perianth segments 6, alike, connate at the base; stamens 6, dimorphic, the filaments distinct, inserted on the perianth; anthers versatile; ovary 3-lobed, few-ovuled; capsule loculicidal.

Triteleia grandiflora Lindl. [*Brodiaea douglasii* Wats.]. Plants erect from bulbs 8–20 cm below ground; leaves 1 or 2, linear, shorter than or surpassing the scapes, straight; scapes mainly 2–7 dm tall (above ground); spatheaceous bracts distinct, usually several-veined; umbels 5- to 16-flowered, the pedicels shorter to longer than the flowers; perianth blue, 14–27 mm long, the segments connate ca 1/2–2/3 the length; stamens included; capsules 5–10 mm long, subterete, stipitate, the stipe 3–5 mm long; seeds ca 2 mm long. Sagebrush, mountain brush, aspen, and Douglas fir communities at 1400 to 2850 m in Cache, Morgan, Salt Lake, Summit, Utah, Wasatch, and Weber counties; British Columbia to Montana, south to Oregon, Idaho, and Wyoming; 16 (i).

Tulipa L.

Perennial caulescent or subscapose herbs from tunicate bulbs; leaves 2 to several, basal or one or more cauline, ovate to elliptic or linear; flowers typically erect; perianth segments 6, alike or unlike in color and texture, distinct; stamens 6, borne on the receptacle; anthers basifixed; ovary 3-loculed, the stigma sessile, 3-lobed; capsules loculicidal. This is a large genus of Old World plants. Several ornamental species are known in cultivation in Utah. They persist following cultivation and occur as waifs along roadsides and in refuse dumps. At least the common ones are treated here to provide answers to those who discover waifs, especially.

1. Staminal filaments hairy at the base; leaves lance-linear *T. sylvestris*
- Staminal filaments glabrous throughout; leaves ovate to lanceolate or broadly elliptic 2
- 2(1). Perianth segments mostly 8–10 cm long, typically scarlet *T. fosteriana*
- Perianth segments mostly 3–6 cm long, variously colored *T. gesneriana*

Tulipa fosteriana W. Irv. Empress Tulip. Outer bulb scales dark brown, silky hairy within; leaves 3 or 4, ovate to elliptic or lanceolate, 10–22 cm long, 2–10 cm wide; stems 15–25 cm long; flowers solitary, campanulate, becoming explanate, brilliant scarlet with black blotches basally, these margined with yellow; segments 8–10 cm long, elliptic to obovate, emarginate and ciliate apically; stamens ca 1/4 as long as the segments or shorter. Commonly grown ornamental through much of Utah; introduced from Asia; 1 (0).

Tulipa gesneriana L. Common Tulip. Outer bulb scales brown, appressed hairy near the apex; leaves 3–5, lanceolate to ovate or elliptic, 7–18 cm long, 2–10 cm wide; stems 10–40 cm long or more; flowers solitary or 2 or 3, campanulate, at length opening widely, variously brightly colored or white; segments mainly 3–6 cm long, obovate to elliptic or oblanceolate, obtuse to rounded or emarginate and ciliate apically; stamens ca 1/3 as long as the segments, often purple; 2n = 24, 25, 26, 36, 48. The common tulip is grown widely in Utah; introduced from Asia; 2 (0). The plants grown in Utah consist of a series of hybrid derivatives, mainly involving *T. gesneriana* L. and *T. praestans* Hort.

Tulipa sylvestris L. Outer bulb scales brown, hairy at the apex within; leaves 2 or 3, lance-linear to narrowly elliptic, 8–24 cm long, 0.8–2 cm wide; stems 8–25 cm long; flowers solitary (or 2), campanulate, yellow or orange within, greenish to purplish without, 2.5–5 cm long, the inner segments fringed basally; stamens ca 1/2 as long as the segments, hairy basally. Uncommonly cultivated "species" tulip, rather widely grown in Utah; introduced from Europe; 1 (0). *T. clusiana* DC. is also known to occur in Utah.

Veratrum L.

Tall stout leafy poisonous perennials from stout rhizomes; leaves broad, strongly veined and plaited, the bases sheathing; flowers greenish yellow to whitish, often bicolor, in large, terminal panicles; perianth segments 6, distinct, more or less glandular at the base; stamens 6; pistil 1, the styles 3, persistent; fruit a 3-loculed, septicidal capsule.

Veratrum californicum Durand False Hellebore; Skunk-cabbage. Plants mostly 15–20 dm tall, typically glabrous below, becoming tomentose above; leaves numerous, 1–3 dm long, 6–20 cm wide, ovate to elliptic, or lanceolate, sheathing basally, reduced upward; panicle 2–6 dm long, many-flowered, erect, the branches spreading to ascending; flowers subsessile to shortly pedicellate; perianth greenish yellow to white, the segments abruptly narrowed and clawed basally, 8–15 (17) mm long, entire to erose or denticulate; stamens shorter than the perianth; ovary glabrous or hairy; capsules 2–3 cm long; seeds broadly winged, 10–15 mm long; n = 16. Meadows and stream banks in aspen, mixed conifer, and spruce-fir communities at 1830 to 3115 m in Box Elder, Cache, Davis, Duchesne, Millard, Rich, Salt Lake, Sanpete, Sevier, Summit, Tooele, Uintah, Utah, Wasatch, Washington, and Weber counties; Washington to Montana, south to California, New Mexico, and Mexico; 31 (v). Consumption of this plant by pregnant sheep results in abortion or production of monstrosities.

Zigadenus Michx.

Perennial bulbous poisonous plants; leaves linear, mainly basal, those of the stem reduced upward; flowers in terminal racemes or panicles, perfect or polygamous; perianth withering and persisting, bearing 1 or 2 glands just above the narrowed base, 6-segmented; pistil 1; styles 3, distinct; fruit a 3-locular septicidal capsule.

Preese, S. J. 1956. A cytotoxic study of the genus *Zigadenus* (Liliaceae). Ph. D. Dissertation. Washington State Univ. 167 pp.

1. Perianth segments 4–7 mm long; ovary superior; glands of perianth ovate or semicircular 2
- Perianth segments (8) 9–11 mm long; ovary partly inferior; glands of perianth orbiculate 3
- 2(1). Perianth segments usually less than 4 mm long, acute or acuminate; sepals clawless; flowers borne in panicles (rarely in racemes); plants common and widespread *Z. paniculatus*
- Perianth segments 5–7 mm long, obtuse to acute; sepals clawed or clawless; flowers in long-pedicellate racemes or less commonly in panicles; plants uncommon, though widespread *Z. venenosus*
- 3(2). Flowers cream to greenish, typically more than 15 mm wide, borne in racemes or less commonly in panicles; plants of higher elevations *Z. elegans*
- Flowers white, typically less than 15 mm wide, typically borne in panicles; plants of hanging gardens in southeastern Utah *Z. vaginatus*

Zigadenus elegans Pursh Elegant Death Camas. [*Anticlea elegans* (Pursh) Rydb.]. Plants 1.2–8 dm tall; basal leaves 8–30 cm long, 3–15 mm wide, slightly keeled; flowers greenish to cream, borne in racemes or less commonly in panicles; perianth segments 8–11 mm long, not clawed, each bearing a large, orbiculate gland at the base; capsule 1.5–2 cm long; 2n = 32. Meadows and stream-banks in aspen, lodgepole pine, and spruce-fir communities and in alpine tundra at 2150 to 3510 m, and less commonly downward along streams to 1980 m, in Beaver, Cache, Daggett, Duchesne, Garfield, Grand, Iron, Juab, Kane, Piute, Salt Lake, San Juan, Sanpete, Sevier, Summit, Tooele, Uintah, Utah, Wasatch, and Washington counties; Alaska to the Great Lakes, south to Oregon, Nevada, Arizona, New Mexico, Texas, and northern Mexico; 85 (xi).

Zigadenus paniculatus (Nutt.) Wats. Foothill Death Camas. [*Helonias paniculata* Nutt.]. Plants 2–7 dm tall; leaves mostly below the stem middle, sheathing, 1–3.5 dm long, 3–13 mm broad, much reduced upward; flowers all perfect, or the upper ones perfect and the lower ones staminate or functionally staminate, borne in panicles, these mostly 1–3 dm long; pedicels 5–25 mm long; perianth white or cream, broadly campanulate, the segments unequal, the sepals clawless or nearly so, broadly ovate, 3–4 (4.5) mm long, acute to acuminate, the inner ones longer, with a claw 0.5–1 mm long, the gland broadly ovate; stamens usually 1–2 mm longer than the perianth segments; styles ca 3 mm long; capsules 1.5–2 cm long. Blackbrush, other warm desert shrub, pinyon-juniper, sagebrush, mountain brush, ponderosa pine, Douglas fir, and grassland communities at 850 to 2685 m in all Utah counties; Washington to Montana, south to California, Nevada, Arizona, and New Mexico; 88 (x).

Zigadenus vaginatus (Rydb.) Macbr. Alcove Death Camas. [*Anticlea vaginata* Rydb., type from Natural Bridges National Monument]. Plants 3–10 dm tall or more; leaves mostly below the stem middle, sheathing or the upper ones sheathless, 20–75 cm long, 6–18 mm wide, reduced upward; flowers perfect, borne in panicles, these 15–43 cm long; pedicels 6–23 cm long; perianth white, rotate, the subequal segments clawless, obovate to spatulate or elliptic, 6–7 mm long, rounded to obtuse, each bearing a large obovate gland at the base; stamens shorter than the perianth segments; styles ca 2–3 mm long; capsules 10–15 mm long. Hanging garden communities in seeps and alcoves in Grand, Kane, and San Juan counties; endemic (?); 9 (vi). The plants flower in late August to the end of October. This species simulates the larger flowered *Z. elegans*, which occurs mainly at high elevations and flowers in spring and early summer, but the alcove death camas evidently has affinities southward with *Z. volcanicus* Benth. of Guatemala.

Zigadenus venenosus Wats. Meadow Death Camas. [*Toxicoscordion venenosum* (Wats.) Rydb.]. Plants 1.5–7 dm tall; leaves mostly at the stem base, 1–3.5 dm long, 2–6 (10) mm wide, keeled, reduced upward; flowers in racemes or less commonly in panicles, these rarely over 1.5 dm long; pedicels ascending, 5–30 mm long; perianth white or cream, campanulate, the segments dimorphic, the sepals 4–5 mm long and with or without a claw, the inner segments somewhat longer and with a claw to 1 mm or more long, the gland usually broader than long; stamens subequal to or slightly surpassing the perianth; styles 2–3 mm long; capsules 8–15 mm long. Wet and drying meadows and streamsides in sagebrush, pinyon-juniper, mountain brush, and white fir communities at ca 2600 to 2990 m in Beaver, Daggett, Duchesne, Millard, Sanpete, Sevier, Uintah, Utah, and Washington counties; British Columbia to Saskatchewan, south to California, Colorado, Nebraska, and Mexico; 13 (0). A specimen from southern Uintah County approaches var. *gramineus* (Rydb.) Walsh ex Peck [*Z. gramineus* Rydb.], in the sheathing upper stem leaves and greatly reduced claws or clawless sepals. More material is necessary to adequately interpret varietal status.

Submersed annuals with fibrous roots; stems slender, elongate or short (in *N. caespitosa*), branched; leaves small, subopposite or verticillate, sessile, the base dilated and sheathing, linear, entire or toothed; flowers unisexual, small and concealed by the leaves, solitary, axillary; staminate flowers with 2-lipped perianth and 1 stamen, the perianth entire to 4-lobed; pistillate flowers usually naked; pistil 1-loculed and 1-ovulate; stigmas 2–4; fruit sessile, indehiscent; $x = 6, 7$.

Najas L.

Plants with characters of the family.

1. Leaves and stems spinulose-toothed, the teeth 0.5–1.5 mm long and evident without a hand lens *N. marina*
- Leaves entire or minutely toothed, the teeth not evident without a hand lens; stems entire 2
- 2(1). Plants acaulescent or nearly so, 0.2 dm high; seed coat not coarsely pitted, shiny; leaves gradually tapering to a slender point *N. caespitosa*
- Plants caulescent, 1.5–6 dm tall; seed coat coarsely pitted and dull; leaves abruptly tapering to a rounded or obtuse point *N. guadalupensis*

Najas caespitosa (Maguire) Reveal Fish Lake Naiad. [*N. flexilis* ssp. *caespitosa* Maguire, type from Pelican Point, Fish Lake, Sevier County]. Plants acaulescent or nearly so, compact, 2–4 cm high; leaves narrowly linear, entire (rarely few toothed), 3–12 mm long, 0.5–1.5 mm wide, expanded into a sheath basally; staminate flowers 2–2.5 mm long; anther 1, 1-loculed; pistillate flowers 2–2.5 mm long, stigmas mostly 3(2); fruit 2–2.5 mm long; seed 1, shiny, finely reticulate with 45–70 rows of small areolae. In shallow water 3 dm deep at Pelican Point, Fish Lake, at 2623 m in Sevier County; endemic, rare, and known only from the type collection, 3 August 1940 (Maguire 19888, UTC, BRY); 1 (0).

Najas guadalupensis (Sprengel) Morong [*Caulina guadalupensis* Sprengel; *N. flexilis* var. *guadalupensis* A. Br.; *N. microdon* var. *guadalupensis* A. Br.]. Plants caulescent, branching throughout; stems slender, smooth or occasionally minutely toothed; 3–6 dm long; leaves narrowly linear, 7–20 mm long, 0.3–0.8 mm wide, toothed, the teeth not visible without a hand lens, rarely completely entire, expanding into a sheath below; staminate flowers 2–3 mm long, anthers 4-loculed; pistillate flowers 2–3 mm long, stigmas 2–3; fruits 2.5–3 mm long, pitted with 10–20 rows of areolae, dull; $2n = 24$. In fresh, slow moving streams, or in ponds or lakes, at 1330 m in Cache and Salt Lake counties; over most of North America and South America; 1 (0).

Najas marina L. Caulescent plants 1–4 dm high; stems branched, stout and spinulose-toothed; leaves stiff, coarsely toothed, narrowly linear, 1–4 cm long, 1–3 mm wide, the teeth 0.5–1.5 mm long and obvious to the naked eye, the basal sheath broadly expanded, 5–6 mm long; staminate flowers 3–4 mm long; anther solitary, 4-loculed; pistillate flowers 3–4 mm long, stigmas 3; fruits 4–5 mm long; seed solitary, coarsely pitted, dull; $2n = 12$. In fresh slow moving streams, and in lakes and ponds, in Cache, Juab, and Tooele counties; introduced from the Old World and scattered in the U. S. from California eastward; 1 (0).

NAJADACEAE A. L. Juss.

Water-nymph Family

ORCHIDACEAE A. L. Juss

Orchid Family

Perennial herbs from coralloid rhizomes, corms, or tubers; stems erect, short or much elongated, slender to somewhat thickened, naked to bracteate or very leafy; leaves simple, linear to orbicular; inflorescence terminal or axillary; flowers small and inconspicuous to large and showy, irregular; sepals 3; petals 3, free or united and adnate to the inferior ovary, one petal (the lip) differing from the other two in form, size, and coloration, often forming a spur or nectary from the base; stamens and pistils adnate to form a column; anthers mostly 2-loculed, producing masses of pollen (pollinia), the pollen powdery, waxy, or mealy; fruit a dry capsule or fleshy pod; seeds numerous; x = 6-29+.

Correll, D. S. 1950. Native Orchids of North America. Stanford Univ. Press. Stanford, California.
Leur, C. A. 1975. The Native Orchids of the United States and Canada excluding Florida. New York Botanical Garden. Bronx, N. Y.

- 1. Lip an inflated sac-like pouch; fertile stamens 2, borne laterally on the column ... Cypripedium
— Lip not an inflated sac-like pouch; fertile stamen 1 ... 2
2(1). Leaves absent at flowering time ... 3
— Leaves present at flowering time ... 4
3(2). Roots coralloid; plant without chlorophyll ... Corallorhiza
— Roots not coralloid; plants with chlorophyll ... Spiranthes
4(2). Lip prolonged at base into a prominent saccate or slender spur ... Habenaria
— Lip not forming a spur ... 5
5(4). Flowers 1 or occasionally 2, the lip saccate; leaf single; plant from a small corm ... Calypso
— Flowers several; leaves 2 or more ... 6
6(5). Leaves 2, opposite, borne near middle of the stem; lip wedge-shaped ... Listera
— Leaves alternate, lip saccate or concave ... 7
7(6). Roots arising from a creeping rhizome; leaves mottled, evergreen, mostly in a basal rosette ... Goodyera
— Roots fleshy, fascicled; leaves not mottled and evergreen, mostly cauline ... 8
8(7). Lip saccate at base; flowers racemose, brownish purple; leaves lanceolate to ovate ... Epipactis
— Lip concave near the base; flowers in a spirally twisted spike, white or whitish; leaves linear to linear-lanceolate ... Spiranthes

Calypso Salish.

Plant terrestrial, small, with a corm and fleshy roots or a coralloid rhizome; leaf solitary; scape 1-flowered; sepals and petals alike, linear-oblong to lanceolate, spreading; lip larger than the rest of the flower, deeply saccate, dilated at the anterior margin of the orifice and forming an apron that is adorned with hairs at the base; column broadly winged, having the operculate anther just below the apex; pollinia 2, bipartite, waxy; capsule erect, ellipsoid-cylindric.

Calypso bulbosa (L.) Oakes Fairy Slipper. [Cypripedium bulbosum L.]. Stems erect, glabrous, 6-20 cm tall; leaf solitary, arising from the summit of the corm, 2-6 cm long, cordate-ovate to elliptic; flower solitary, rarely 2, showy, pendent, purplish to pinkish white; sepals and

petals 1.2-2.3 cm long, ca 2.7 mm wide, lip pendent, calceolate, ovate-oblong in outline, 1.5-2.3 cm long, 7-13 mm wide; sac expanded in front and forming a whitish apron, vividly marked on the inner surface with reddish spots and lines; apron bearded at base with 3 longitudinal rows of white, yellow or brown spotted hairs; column petaloid, suborbicular, inverted over the orifice of the lip, 7-12 mm long; capsule erect, 2-3 cm long; n = 28. Sagebrush, lodgepole pine, spruce-fir, and aspen communities at 2700 to 3200 m in Cache, Daggett, Duchesne, Grand, San Juan, Summit, Uintah, and Wasatch counties; Alaska to Labrador, south to California, Arizona, Colorado and New York; Eurasia; 18 (0).

Corallorhiza Chatel.

Non-green seapose saprophytic herbs, with short to elongated rhizomes that are much branched, toothed and coralloid; stems brownish, yellowish or purplish, clothed with several membranaceous sheathing bracts; inflorescence terminating the naked scape, a lax or dense raceme of yellowish, brownish, or purplish flowers; sepals subequal, the lateral ones united at the base and forming a short mentum more or less adnate to the ovary; lip simple to 3-lobed, slightly adhering to the base of the column; column compressed; anther terminal; pollinia 4, waxy, free; capsule ovoid to ellipsoid, pendent.

- 1. Sepals always 1-nerved; lip 3-5 mm long; petals 5.5 mm or less long; plant small, mostly yellowish ... C. trifida
— Sepals usually 3-nerved; lip and petals 5.5 mm or more long; plant larger, 1.5 dm or more tall, usually reddish or purplish ... 2
2(1). Perianth segments prominently striped with reddish brown or purple; lip linguiform ... C. striata
— Perianth segments not prominently striped; lip not linguiform, with flat margins ... 3
3(2). Lip with an evident though small lateral lobe on each side, spotted with purplish red ... C. maculata
— Lip without lateral lobes, not spotted ... C. wisteriana

Corallorhiza maculata Raf. Spotted Coralroot. Stems erect, 2-5.5 dm tall, purplish to yellowish, stout to slender; flowers 10-30, minutely bracteate, erect but reflexed in age; sepals linear to oblanceolate, 6-8 mm long, 3.5-5 mm wide, reddish purple; petals slightly shorter than the sepals, often with a few dark reddish spots; lip white, spotted with red, 5-8 mm long, 3.5-5 mm wide, deeply but unequally 3-lobed, the lateral lobes small, 1.3 mm long, the middle lobe nearly orbicular, more or less crenate; column 4-5 mm long, strongly curved, yellow with magenta spots on the ventral surface; capsule ovoid, 1.5-2.5 cm long; 2n = 42. Mountain brush, aspen, spruce-fir, and lodgepole pine communities at 1830 to 3800 m in Box Elder, Cache, Daggett, Duchesne, Garfield, Grand, Juab, Kane, Millard, Piute, Salt Lake, San Juan, Sanpete, Sevier, Summit, Tooele, Uintah, Utah, Washington, and Wayne counties; Alaska to Guatemala; 48 (iv).

Corallorhiza striata Lindl. Striped Coralroot. Stems erect, 1.5-5 dm tall, reddish purple to brownish purple, stout; flowers 7-25 in a minutely bracted raceme, arcuate, pinkish yellow or whitish tinged and conspicuously striped with reddish purple; sepals oblong-elliptic to linear-lanceolate, 3- to 5-nerved, with the nerves reddish purple, 6.5-16 mm long, 2.3-5 mm wide; petals 6-15

mm long, 2.5–5.5 mm wide, 3- to 5-nerved, with the nerves reddish purple, the lip white, striately veined with reddish purple, 6–12 mm long, to 8.5 mm wide, somewhat reflexed near the base, entire, broadly elliptic, fleshy, with thickened involute margins and 2 median callosities near the base; column 4–7 mm long, arcuate, thickened at the base; capsule ellipsoid, becoming reflexed, 1.2–2 cm long; $2n = 42$. Mountain brush, aspen, and spruce-fir communities at 2200 to 2900 m in Box Elder, Cache, Davis, Duchesne, Garfield, Juab, Salt Lake, Tooele, Uintah, Utah, Wasatch, and Washington counties; British Columbia to Quebec, south to Mexico through the western states; 14 (i).

Corallorhiza trifida Chatel. Early Coralroot. Stems erect, 0.4–3 dm tall, pale yellow, greenish yellow or deep yellow, very slender; flowers 3–20, minutely bracteate, small, erect-spreading, yellowish white to greenish or dull purple; sepals linear-oblong to linear-oblongate, obtuse, 1-nerved, 4.5–6.5 mm long, 1–1.8 mm wide; petals 4.5–5.5 mm long, 1.4–2 mm wide, slightly smaller than the sepals, the lip white or nearly so, occasionally purple-spotted, 3.5–4.5 mm long, 2.3 mm wide, oblong-quadrate, usually with a small triangular upcurved tooth on each side near the base; column broad arcuate, 3.5–7 mm long; capsule 8–12 mm long; $2n = 38, 42$. In moist meadows in aspen, spruce, or lodgepole pine forests at 2000 to 3050 m in Cache, Duchesne, Garfield, Piute, Salt Lake, Sanpete, Summit, Uintah, Wasatch, and Wayne counties; Alaska to Labrador and south to Oregon, Colorado, Indiana, and New Jersey; 12 (0).

Corallorhiza wisteriana Conrad Wister Coralroot. Plant much like *C. maculata* but smaller in size, to 4 dm tall; sepals and petals greenish yellow, 1- to 3-nerved, the lip white, spotted with red, 5.5–7 mm long, 4–5 mm wide, short-clawed, truncate, often retuse at apex, erose-denticulate or undulate, the lateral lobes obsolete. Moist alpine meadows and lodgepole pine communities at 2800 to 3200 m in Duchesne, Garfield, Rich, Summit, Uintah, Wasatch, and Washington counties; throughout the eastern U. S., west to Montana, Wyoming, Arizona, and Mexico; 6 (0).

Cypripedium L.

Terrestrial caulescent herbs with fibrous roots from a short rhizome; leaves sheathing, 2 or more, plicate and prominently ribbed; flowers 1 to several, showy, bracteate; sepals spreading, free or united; petals spreading, free, smaller and narrower than the sepals, lip sessile, inflated, saccate; column declined, with 2 lateral fertile stamens and a thick dorsal staminode; stigma terminal, slightly 3-lobed; ovary 1-loculed; capsule obovoid to ellipsoid.

1. Leaves 2, opposite, near the summit of the stem; flowers corymbose, 2–4; lip purplish *C. fasciculatum*
- Leaves 3 or more, scattered; flower usually solitary; lip deep yellow to white, marked with purple about the orifice *C. calceolus*

Cypripedium calceolus L. Lady's Slipper. Stems erect, herbaceous, to 5 dm tall, glandular-pubescent throughout; leaves (2) 3–5, elliptic to ovate or ovate-lanceolate, acute, many-nerved, 5–20 cm long, 4–10 cm wide; flowers 1 or 2 at the stem apex, each subtended by a foliaceous bract to 10 cm long and 4 cm wide; sepals and petals greenish yellow to purplish; dorsal sepal twisted, lance-

olate, 3–4 cm long, ca 1 cm wide, the lower pair completely connate or with a slight apical notch, petals longer and narrower than the sepals, spirally twisted, 4–9 cm long; lip strongly pouched, firm, yellow with purple dots around the orifice, 2–3 cm long; staminode yellow, spotted with purple, triangular to oblong-linear, auriculate at the base, to 10 mm long; ovary ribbed; capsule ellipsoid. River and canal banks in the valleys or to spruce-fir forests at 1470 to 3000 m in Cache, Grand, Salt Lake, Utah, and Weber counties; British Columbia to Washington, New York, and Louisiana; Eurasia; 9 (0).

Cypripedium fasciculatum Kellogg ex Wats. Stems slender, to 3 dm tall, viscid-villous, with scarious sheaths near the base; leaves 2, opposite or nearly so at the stem apex, oblong-elliptic to orbicular-ovate, nearly glabrous to puberulent, 4–11 cm long, 2.5–7.5 cm wide; peduncle short, elongating in age; bracts ca 3.5 cm long, 6–13 mm wide; flowers small, 2–4; sepals lanceolate, acuminate, 1.5–2.5 cm long, 3–6 mm wide, lower pair connate; petals broadly ovate, similar to the sepals; lip small, globose, greenish yellow, 8–14 mm long, with the purplish margin deeply infolded; staminode smaller than the stigma, 2.5–3 mm long; capsule obovoid-ellipsoid, 1.5–2 cm long; $2n = 20$. Usually in duff in spruce-fir or lodgepole pine forests at 2650 to 3000 m in Daggett, Salt Lake, Summit (?), and Uintah counties; Montana, Idaho, Wyoming, and Colorado, west to Washington, Oregon, and California; 9 (0).

Epipactis Swartz

Stems erect, leafy, and arising from a short, creeping rhizome; leaves variable, orbicular to linear-lanceolate; inflorescence a conspicuously bracted, many-flowered raceme; floral bracts foliose, greatly exceeding the flowers; flowers small to medium sized, greenish to purplish; sepals free, subequal; petals similar to sepals but smaller; lip sessile on base of column, fleshy, saccate at base, enlarged above into a flat lamina, constricted or distinctly 3-lobed above; column short; anther sessile, behind the stigma on a slender jointed base; pollinia 4, mealy-granulose; capsule obovoid to ellipsoid, pendent or spreading.

Epipactis gigantea Dougl. ex Hook. Helleborine. Stems erect, stout, glabrous or nearly so, often tinged with purple at the base, leafy, 3–14 dm tall; leaves clasping the stem or with a short tubular petiole, broadest on the lower part of stem, ovate to ovate-elliptic or narrowly lanceolate, 5.5–20 cm long, 2–7 cm wide; raceme 2–12 or more flowered, elongate, lax; bracts leaflike, to 15 cm long and 2 cm wide; flowers showy; sepals greenish to rose, with purple or dull red nerves, deeply concave, 1.3–1.7 cm long, 6–8 mm wide; petals similar to sepals but thinner and more brownish purple; lip strongly veined and marked with red or purple, sessile on base of column, complex, deeply and unequally 3-lobed, 8–9 mm long, 7–8 mm wide; column short, erect, stout, 8–10 mm long; capsule ellipsoid, pendent, 2–2.5 cm long; $2n = 40, 60$. Marshy and shady areas along rivers, streams, meadows, seeps, and hanging gardens from warm desert shrub to spruce communities at 830 to 2905 m in Cache, Carbon, Duchesne, Emery, Garfield, Grand, Juab, Kane, Millard, San Juan, Sanpete, Tooele, Uintah, Utah, Washington, Wayne, and Weber counties; British Columbia to Baja California and most of the western U. S. to South Dakota and Mexico; 85 (ii).

Goodyera R. Br.

Plants scapose herbs with creeping rootstocks bearing several thick fibrous roots; leaves basal, ovate to lanceolate, dark green or bluish green, reticulate-veined or variegated with white, the sheaths somewhat inflated; inflorescence a lax to densely flowered secund-spicate raceme; flowers small, white to pink or tinged with yellow or green; the oblique petals connivent with the dorsal sepal and forming a hood over the column and lip; lip sessile, deeply concave and saccate at the base, straight or recurved at the apex, entire or rarely lobed; column short, the anther borne on the back; pollinia 2; capsule erect, ovoid to ellipsoid.

Goodyera oblongifolia Raf. Rattlesnake-plantain. Stems scapose, densely glandular-pubescent above, 2–3.5 dm tall; leaves in a basal rosette, spreading, with broad petioles, oblong-elliptic to lanceolate, dark green or bluish green, concolorous or reticulate-veined and whitish along the midvein, 4–11 cm long, 1.5–3.5 cm wide; raceme densely flowered, strongly secund or in a loose spiral, tapering to the apex, 6–14 cm long; floral bracts ovate to ovate-lanceolate, 8–12 mm long; flowers white, tinged or streaked with green; dorsal sepal triangular-lanceolate, 6.5–10.5 mm long, the lateral ones obliquely ovate-lanceolate, 5–8 mm long; petals 6.5–10 mm long; lip deeply concave-cymbiform, with a long beak and involute margins, 5–8 mm long, saccate portion 1.5–2.5 mm deep and up to 4.5 mm wide, the beak sulcate, 2–3 mm long; column 4–5.5 mm long, with a slender beak; capsule obovoid-elliptic, ca 1 cm long; 2n = 22, 30. Mountain brush, maple, aspen, spruce, and fir communities at 1870 to 3100 m in Cache, Daggett, Iron, Rich, Salt Lake, San Juan, Sanpete, Tooele, Utah, and Washington counties; Alaska to Nova Scotia, south to Maine, Michigan, South Dakota, New Mexico, Arizona, and California; 16 (iii).

Habenaria Willd.

Erect herbs with fleshy or tuberous roots; stems glabrous, simple, leafy or bracteate; leaves 1 or more, basal or cauline, sessile, sheathing the stem; flowers relatively small, racemose; sepals free, alike or dissimilar, the dorsal sepal erect or incurved to form a hood over the column, the lateral sepals spreading or reflexed; petals free, erect, usually connivent with the dorsal sepal, simple or bipartite; lip pendent to upcurved, entire or lobed, extended at the base into a spur, this saccate-rotiform to elongate-filiform, shorter to much longer than the pedicellate ovary; column short; stigmas with or without papillae; anthers 2-loculed, the sacs separated by a broad connective; pollen granular; capsule narrowly cylindrical to ellipsoid.

1. Leaves 1 or rarely 2, broadly obovate to oblanceolate; lip linear to narrowly triangular-lanceolate; spur tapering from a rather broad base, subequal to the lip *H. obtusata*
— Leaves several to many, basal and cauline 2
- 2(1). Leaves 2–4, always clustered at or near base of stem, usually withering before anthesis; flowers subsessile; sepals 1-nerved; spur subequal to slightly longer than the lip *H. unalascensis*
— Leaves many, scattered on the stem, persistent; flowers pedicellate; sepals usually more than 1-nerved 3

- 3(2). Lip unequally 3-lobed at apex, the lateral lobes the longest; bracts leaflike, more than 2 cm long . . . *H. viridis*
— Lip without lobes at apex; bracts mostly shorter than 2 cm 4
- 4(3). Lip rhombic-lanceolate to broadly lanceolate, dilated at the base; flowers whitish *H. dilatata*
— Lip linear to elliptic-lanceolate, never dilated at the base; flowers greenish 5
- 5(4). Spur saccate to clavate, didymous near the tip, about half as long as the lip *H. saccata*
— Spur not saccate, subequal to the lip or greatly exceeding it 6
- 6(5). Spur 1.5–2 times as long as the lip *H. zothecina*
— Spur shorter than or exceeding the lip only slightly 7
- 7(6). Flowers usually scattered in elongate racemes; lip usually linear and with a fleshy ridge in the center *H. sparsiflora*
— Flowers usually in dense cylindrical racemes; lip usually lanceolate and without calli below the middle *H. hyperborea*

Habenaria dilatata (Pursh) Hook. White Bog-orchid. [*Orchis dilatata* Pursh]. Plants erect, glabrous, 1.5–12 dm tall; stems slender or stout, leafy; leaves lanceolate to oblanceolate, to 30 cm long and 5.5 cm wide; inflorescence a many-flowered cylindrical laxly or densely flowered raceme to 45 cm long and 3.5 cm wide; floral bracts lanceolate, exceeding the flowers; flowers white, or yellowish white or tinged with green; dorsal sepal ovate to elliptic, connivent with the petals to form a hood over the column, 3-nerved, 3–7 mm long, 2.5 mm wide, the lateral sepals elliptic-lanceolate to narrowly lanceolate, 3-nerved, 4–9 mm long; petals ovate-lanceolate to linear-lanceolate, falcate, obliquely dilated at the base, 1- or 2-nerved, 4–8.2 mm long, the lip variable, rhombic-lanceolate to broadly lanceolate or with a suborbicular base and linear anterior part, strongly dilated at the base, 5–10 mm long, 2–5 mm wide at the base, the spur cylindrical, shorter to twice as long as the lip; n = 21.

1. Spur less than 2/3 the length of the lip, thickly cylindrical *H. dilatata* var. *albiflora*
— Spur as long as the lip to twice as long, slenderly cylindrical 2
- 2(1). Spur ca 1 1/2–2 times as long as the lip and strongly curved; plants of higher elevations *H. dilatata* var. *leucostachys*
— Spur subequal to the lip and not strongly curved; plants of middle elevations *H. dilatata* var. *dilatata*

Var. *albiflora* (Cham.) Correll [*H. borealis* var. *albiflora* Cham.; *Platanthera dilatata* var. *albiflora* (Cham.) Ledeb.; *Limnorchis dilatata* ssp. *albiflora* (Cham.) A. Love & Simmon]. Moist rocky slopes, meadows, woods, and along streams at 1950 to 3200 m in Box Elder, Cache, Garfield, Salt Lake, Summit, and Wasatch counties; Alaska to Colorado; 12 (0).

Var. *dilatata* [*H. borealis* var. *dilatata* (Pursh) Cham.; *Platanthera dilatata* (Pursh) Beck; *Limnorchis dilatata* (Pursh) Rydb.]. Moist areas in canyons, meadows or along seeps and streams to 2500 m in Cache, Beaver, Duchesne, Juab, and Salt Lake counties; Greenland to Alaska, south to Pennsylvania, Colorado, New Mexico, and Oregon; 18 (vi).

Var. *leucostachys* (Lindl.) Ames [*Platanthera leucostachys* Lindl.; *Limnorchis leucostachys* (Lindl.) Rydb.]. Alpine meadows and springs in lodgepole, aspen, and spruce-fir communities at 2600 to 3500 m elevation in Box Elder, Cache, Daggett, Davis, Duchesne, Garfield, Iron, Juab, Kane, Piute, Salt Lake, Sevier, Summit, Tooele, Uintah, Utah, Washington, and Weber counties; Alaska to Nevada; 75 (vii).

Habenaria hyperborea (L.) R. Br. Northern Bog-orchid. [*Orchis hyperborea* L.; *Platanthera hyperborea* (L.) Lindl.; *Limnorchis hyperborea* (L.) Rydb.; *Habenaria borealis* var. *viridiflora* Cham.]. Plants erect, slender to stout, 1.5–10 dm tall; stems leafy throughout or only near the base, glabrous; leaves variable, linear, oblong-elliptic to oblanceolate, reduced to bracts above, 4.5–30 cm long, 0.8–4.5 cm wide; inflorescence a densely to laxly flowered, spicate raceme 3–25 cm long and 1–2.5 cm wide; floral bracts lanceolate to linear-lanceolate, the lower to 3 cm long and greatly exceeding the flowers; flowers small, often fragrant, green or yellowish green; dorsal sepal suborbicular to elliptic ovate, erect and connivent with the petals to form a hood over the column, 3-nerved, 3–7 mm long, 1.3–4 mm wide, lateral sepals ovate to elliptic-lanceolate, 3–9 mm long; petals usually fleshy, ovate-lanceolate to lanceolate, 1- or 2-nerved; lip fleshy, lanceolate to linear, 3- to 5-nerved, 3–9 mm long, 1.5–2.5 mm wide; spur cylindrical, slender to somewhat clavate, 2.5–7.5 mm long, usually shorter than the lip or subequal to it; capsule erect, ellipsoid. Sagebrush, pinyon-juniper, oak brush, aspen, lodgepole, spruce, and fir communities at 1390 to 3545 m in all Utah counties, except Box Elder, Davis, Kane, Morgan, Rich, Tooele, Wayne, and Weber; Alaska to Newfoundland, Greenland, Iceland, south to California, Nevada, Arizona, New Mexico, and Pennsylvania; 75 (iv).

Habenaria obtusata (Banks) Richards. Small Bog-orchid. [*Orchis obtusata* Banks ex Pursh; *Platanthera obtusata* (Banks) Lindl.]. Small glabrous plants 8–35 cm tall; stems naked or with a linear bract about the middle, 4-angled; leaf solitary or rarely 2 at the base of stem, obovate to linear-lanceolate, 4–15 cm long, 1–4.5 cm wide; inflorescence a short, few-flowered raceme 2.5–17 cm long, 1.5–2 cm wide; floral bracts lanceolate, exceeding the flowers, to 2 cm long; flowers greenish-white; dorsal sepal orbicular-ovate, concave, 3-nerved, connivent with the petals to form a hood over the column, the lateral sepals strongly reflexed, elliptic-lanceolate; petals triangular-ovate, falcate, 1-nerved, 4–5.5 mm long, 1.5–2.2 mm wide at the dilated base; lip fleshy, linear to narrowly triangular-lanceolate, acute, strongly pendent, with a small sulcate callus in the center at the base, usually with the lateral margins somewhat revolute, 6–10 mm long, 1–2 mm wide; spur tapering to a somewhat broadened base, curved, 3–8 mm long; column 2 mm long; capsule erect, ellipsoid, 7–10 mm long. Aspen, spruce, and fir communities at 2850 to 3200 m in Duchesne and Summit counties; Labrador to Alaska and south to British Columbia, Oregon, Colorado, Wisconsin, and New York; 4(ii).

Habenaria saccata Greene Slender Bog-orchid. [*Platanthera saccata* (Greene) Hulten; *Limnorchis saccata* (Greene) A. Love & Simmon; *Habenaria stricta* Rydb; *H. neomexicana* Tidestr.]. Plants erect, slender or stout, light green, 1.5–10 dm tall; stems leafy; leaves narrowly

elliptic to linear-lanceolate, 4–14 cm long, 1–4 cm wide; inflorescence a much elongated, laxly many-flowered, slender, spicate raceme to 42 cm long and 8–20 mm wide; floral bracts linear-lanceolate, the lower ones to 6 cm long and greatly exceeding the flowers; flowers small, green, scattered on the elongated rachis; sepals thin, 3-nerved; dorsal sepal suborbicular to ovate or ovate-elliptic, connivent with the petals and forming a hood over the column, 3–5 mm long, 3–3.5 mm wide at the base, the lateral sepals 4–6 mm long, 2–3 mm wide; petals triangular-lanceolate to elliptic-lanceolate, falcate, usually purplish, 1- or 2-nerved, 3–5 mm long, 1.5–2.2 mm wide; lip linear, usually purplish, 4–7.5 mm long, 1–2 mm wide; spur broadly cylindrical to scrotiform, occasionally didymous at the tip, 1/3–2/3 the length of the lip; capsule erect, ca 1 cm long; 2n = 42. Moist or wet meadows, bogs, and thickets or along streams in cottonwood, oakbrush, maple, willow, and aspen communities at 1800 to 2550 m in Duchesne, Juab, Millard, Salt Lake, Summit, and Wasatch counties; Alaska southward to California, New Mexico, Colorado, and Montana; 10 (0).

Habenaria sparsiflora Wats. Watson Bog-orchid. [*Platanthera sparsiflora* (Wats.) Schlecht.; *Limnorchis sparsiflora* (Wats.) Rydb.]. Plants erect, glabrous, light green, 1.5–7.5 dm tall; stems more or less leafy; leaves variable, scattered, oblong-elliptic to linear-lanceolate, 6.5–30 cm long, 1–5 cm wide; inflorescence a laxly few- to many-flowered spicate raceme 1–4.5 dm long and 1–3 cm wide; floral bracts narrowly lanceolate, subequal to the flowers or the lower ones to 4 cm long; flowers light green, usually scattered, the lowermost often remote; dorsal sepal suborbicular to ovate or ovate-elliptic, connivent with the petals, 6–7.5 mm long, 4.5–6 mm wide, the lateral sepals strongly reflexed, 6–10 mm long; petals rather fleshy, triangular-lanceolate to lanceolate, 6–8 mm long; lip fleshy, large for the flower, pendent, linear to linear-lanceolate, 6–14 mm long, 1.5–3 mm wide; spur cylindrical, filiform, equal to or slightly exceeding the lip; capsule ellipsoid, to 1.5 cm long.

1. Column large, with a broad connective; lip ca 8 mm long; spur ca 10 mm long, cylindrical *H. sparsiflora* var. *sparsiflora*
- Column small, usually without a broad connective; lip ca 6 mm long; spur ca 8 mm long, slightly clavate, mostly higher elevations *H. sparsiflora* var. *laxiflora*

Var. *laxiflora* (Rydb.) Correll [*Limnorchis laxiflora* Rydb.]. Moist or wet meadows, springs or streambanks in aspen, Douglas fir, spruce, lodgepole pine, and alpine tundra communities up to 3600 m in Daggett, Duchesne, Summit, and Uintah counties; British Columbia to California, eastward to New Mexico, Colorado, Wyoming, and Montana; 8 (0).

Var. *sparsiflora* Moist or wet meadows, bogs, seeps, or along streams in poplar, mahogany, juniper, aspen, ponderosa pine, lodgepole pine, and spruce-fir communities at 1850 to 3600 m in Cache, Emery, Garfield, Grand, Iron, Juab, Kane, Millard, Piute, Salt Lake, San Juan, Utah, Washington, and Wayne counties; Baja California to Nevada, Colorado, Arizona, and New Mexico; 40 (iii).

Habenaria unalascensis (Sprengel) Wats. Alaska Bog-orchid. [*Spiranthes unalascensis* Sprengel; *Platanthera unalascensis* (Sprengel) Kuntz.]. Plant strict, scapose, glabrous, 2.5–7 dm tall; stem straw colored or purplish brown, leafy only near the base, bracteate above; leaves

2-4 in a basal cluster, oblanceolate to narrowly linear-lanceolate or rarely obovate, pale green, and withering before or during anthesis, 7.5-15 cm long, 1-3 cm wide; inflorescence a narrowly cylindrical, elongate, densely or laxly flowered spicate raceme, 1-3.5 cm long and 7-15 mm wide; floral bracts ovate to linear-lanceolate, prominently 1-nerved, 3-8 mm long, much shorter than the flowers; flowers white, greenish, or yellowish green, small, numerous, and fragrant; sepals thin, elliptic to broadly ovate-elliptic, 1-nerved, 2-4 mm long, 0.8-1.5 mm wide; petals fleshy, sometimes tinged with purple, ovate to elliptic-lanceolate, 1-nerved, 1-4 mm long, 0.8-1.5 mm wide; lip elliptic with a small lobe on each side at the base, fleshy-thickened through the center below the middle, 3-nerved, 2.5-4.5 mm long, 1.2-3 mm wide at the base; spur cylindrical, slender, curved, 3-4.5 mm long, subequal to the lip; capsule suberect, obliquely ellipsoid, 6-10 mm long. Somewhat dry to moist slopes in sagebrush, mountain brush, juniper, ponderosa pine, aspen, and lodgepole pine communities at 1870 to 3250 m in Cache, Carbon, Daggett, Duchesne, Grand, Juab, Millard, Rich, Salt Lake, Summit, Tooele, Uintah, Utah, and Weber counties; Quebec to Alaska and south to California, Colorado, and North Dakota; 33 (0).

Habenaria viridis (L.) R. Br. Long-bracted Bog-orchid. [*Satyrium viride* L.; *Orchis virescens* Muhl. ex Willd.]. Plants stout, glabrous, 0.6-6 dm tall; stems leafy; leaves variable, obovate to oblong or lanceolate, 4-15 cm long, 1-6.5 cm wide; inflorescence a dense to laxly flowered raceme to 20 cm long; floral bracts linear-lanceolate, 1.5-5.5 (7) cm long, 2-4 times as long as the flowers; flowers green, with stout pedicels; dorsal sepal ovate-orbicular to oblong-elliptic, 3-6 mm long, 2-3.5 mm wide; lateral sepals ovate-oblong; petals linear lanceolate to linear-oblong, 3-5 mm long; lip narrowly oblong-spatulate or narrowly cuneate, 2- or 3-toothed at the apex, the middle tooth short and obscure, 5-10 mm long, 2-4 mm wide, occasionally tinged with reddish brown, 2-3 times as long as the short saccate spur; capsule ellipsoid, 7-10 mm long. Moist or wet meadows or dryer hillsides in coniferous forests at about 2900 m in Iron (?) and Summit counties; Alaska to Newfoundland south to Washington, Colorado, West Virginia, and North Carolina; 1 (0). Our plants belong to var. *bracteata* (Muhl.) Reichenb. ex Gray [*Orchis bracteata* Muhl. ex Willd.].

Habenaria zothecina Higgins & Welsh Alcove Bog-orchid. Plant erect, glabrous, 1.5-6 dm tall; stem leafy below, reduced upward, oblong-elliptic to linear-oblong, 5-25 cm long, 0.8-6 cm wide; inflorescence laxly 5- to 20-flowered, 0.4-2 dm long, 1-3 cm wide; bracts lanceolate to linear-lanceolate, 9-20 mm long, 1-7 mm wide; flowers yellowish green to greenish; dorsal sepal orbicular or nearly so, connivent with the petals and forming a hood over the column, 4-6 mm long, 3.5-4.5 mm wide, the lateral sepals strongly reflexed, 5-8 mm long; petals triangular-lanceolate to lanceolate, 5-6.5 mm long; lip yellowish, linear to linear-lanceolate, 7-10 mm long, 2-3 mm wide; spur cylindrical, 1 1/2-2 times as long as the lip, curved outward; capsule ellipsoid, erect, 1-1.8 cm long. Moist stream banks, seeps, and hanging gardens in mixed desert shrub, pinyon-juniper, and oakbrush communities at 1330 to 2650 m in Emery, Garfield, Grand (type from near Moab), San Juan, and Uintah counties; endemic; 12 (iv).

Listera R. Br.

Plants small terrestrial herbs; stems slender, glandular-pubescent above; leaves 2, opposite or subopposite, sessile, inserted near middle of stems; inflorescence racemose; flowers small, greenish to greenish purple; sepals and petals free, subequal, alike; lip longer than the sepals and petals, rounded to deeply lobed at the apex, variously toothed, auricled, lobed or entire on each side at the base; column wingless; stigma with a rounded beak; anther borne on the back of column near the apex; pollinia 2, powdery; capsule small, slender, pedicellate.

1. Lip linear-oblong, cleft halfway to the base into linear-filiform to narrowly lanceolate lobes *L. cordata*
- Lip oblong to narrowly-cuneate, not deeply cleft 2
- 2(1). Lip shallowly bilobed, not much narrowed to the auriculate base; leaves lanceolate to elliptic-ovate *L. borealis*
- Lip retuse, abruptly narrowed to a short claw at the base; leaves broad, suborbicular *L. convallarioides*

Listera borealis Morong Northern Twayblade. Plant small, glabrous below, minutely glandular-puberulent above, 5-18 cm tall; leaves 2, subopposite, narrowly elliptic to ovate-elliptic, obtuse, 1.3-6 cm long, 0.7-3 cm wide; raceme few-flowered, lax, 2-9 cm long; flowers pale green or yellowish green, on pedicels 3.5-7 mm long; dorsal sepal elliptic-lanceolate to linear-elliptic, 4-6 mm long, lateral sepals narrowly elliptic to oblong-lanceolate, 4.5-7 mm long; petals linear to narrowly oblong, 4-5.5 mm long; lip broadly oblong, somewhat narrowed at the middle, ciliate on the margins, 7-12 mm long, 4.2-6.5 mm wide above the middle, cleft at the dilated apex into 2 oblong or semiorbicular lobes to 3 mm long, prominently dilated at the base and with conspicuous auricles; column stout, arcuate, 3-4 mm long; 2n = 56. Moist or wet mossy spruce-fir forests, along streams or alpine meadows to 3300 m in Cache, Duchesne, Salt Lake, San Juan, Sevier, and Summit counties; Alaska to Hudson Bay and south to Washington and Colorado; 7 (ii).

Listera convallarioides (Swartz) Torr. Broad-leaved Twayblade. [*Epipactis convallarioides* Swartz]. Plant slender or stout, glabrous below, densely and minutely whitish glandular-pubescent above, 6-37 cm tall; leaves 2, opposite, broadly ovate to elliptic, obtuse to apiculate, glabrous, 2-7 cm long, 1.5-5.8 cm wide; raceme laxly many-flowered, 2-12 cm long; flowers yellowish green, on slender pedicels 4-7 mm long; dorsal sepal ovate-lanceolate, 4.5-5 mm long, the lateral sepals lanceolate, strongly falcate-recurved, 4.5-5.5 mm long; petals linear-falcate, 4-5 mm long; lip with a short slender claw, narrowly cuneate, shallowly notched at the apex, with the lobes rounded and minutely toothed in the sinus, and with a short triangular tooth on each side near the base, 8-13 mm long, 5-7 mm wide near the apex; column slender, slightly recurved, 2.5-3 mm long; 2n = 36. Moist or damp leaf mold, along streams, or in aspen, pinyon pine, mountain mahogany, ponderosa pine, and spruce-fir communities at 2450 to 3000 m in Box Elder, Davis, Duchesne, Juab, Piute, Salt Lake, Sevier, Utah, and Washington counties; Alaska to Newfoundland and south to the Carolinas, Tennessee, Arizona, and California; 46 (iv).

Listera cordata (L.) R. Br. Heart-leaved Twayblade. [*Ophrys cordata* L.]. Plant slender, glabrous, 6.5-25 cm tall; leaves 2, opposite, broadly to narrowly ovate-cordate

or deltoid, mucronate, 0.9–4 cm long, 0.7–3.8 cm wide; raceme slender, laxly to densely flowered, 2–10 cm long; flowers small, purplish or greenish yellow, on pedicels 1–4 mm long; dorsal sepal ovate-oblong to elliptic-oblong, obtuse, 2–3 mm long, the lateral sepals similar; petals elliptic to oblong-linear, obtuse to truncate, 1.5–2.5 mm long; lip linear-oblong, cleft 1/2–2/3 its length, into 2 linear-lanceolate lobes, with a subulate tooth on each side near the base; column short and thick, ca 0.5 mm long; 2n = 34+, 36, 38, 40, 42. Mossy, damp, spruce-fir, aspen, or sphagnum bog communities at 3000 to 3500 m in Duchesne, Summit, and Wasatch counties; Alaska to Greenland, south to California, Nevada, New Mexico, and the Carolinas; 6 (ii).

Spiranthes Rich.

Small to coarse terrestrial herbs with tuberous or rarely fibrous roots; leaves mostly basal, narrow, reduced above to sheathing bracts; flowers in a congested, terminal, spirally-twisted spike, mostly white or creamish, sordid; sepals in ours connivent with the 2 petals and forming a hood enclosing the column and most of the lip or the lateral sepals free and not forming part of the hood; lip sessile or with a short claw, concave and grooved near the base and partly enclosing the column, simple or lobed, spreading or recurved distally; column short in ours, producing a single anther on the back, tipped by a 2-toothed, viscid rostellum; pollinia 2; capsule erect, ellipsoid to ovoid.

- 1. Flowers widely spreading or nodding, only the lateral petals more or less connivent with the upper sepal; lateral sepals somewhat loose and spreading; rare in our area *S. cernua*
- Flowers ascending or outcurved, sepals and lateral petals more or less connivent to form a hood opposite the lip 2
- 2(1). Lip definitely narrowed below the tip (pandurate), its basal callosities obsolete *S. romanzoffiana*
- Lip not narrowed below the tip (ovate), its basal callosities developed *S. porrifolia*

Spiranthes cernua (L.) Rich. [*Ophrys cernua* L.]. Plant erect, glabrous below, downy-pubescent above, 1–5.5 dm tall; roots quite slender, fleshy; leaves mostly basal, linear to linear-lanceolate, 4.5–25 cm long, 0.6–2 cm wide; inflorescence moderately dense, up to 15 cm long; flowers white, usually fragrant, widespreading or somewhat recurved so as to appear nodding, the perianth somewhat downy-pubescent on the outer surface; sepals and petals not connivent and forming a hood over the column, only the upper sepal and lateral petals somewhat connivent; the lateral sepals free; lip ovate-oblong, 6–10 mm long, 3–6 mm wide, arcuate-recurved, with crisped or erose margins, the basal callosities prominent; 2n = 46, 60, 61. Moist or damp places at low elevations in Salt Lake County; eastern and central U. S. west to New Mexico; 2 (0).

Spiranthes porrifolia Lindl. [*Spiranthes romanzoffiana* var. *porrifolia* (Lindl.) Ames & Correll; *S. diluvialis* Shev.]. Plant erect, glabrous below, somewhat glandular-pubescent above, up to 5 dm tall; roots fasciated, long, fleshy; leaves 3 or 4, elliptic-lanceolate, 5–20 cm long, 0.5–2.5 cm wide, green, sometimes soon withering; flowers small, yellowish white; bracts lanceolate, 8–12 mm long, to 3 mm wide; sepals and petals connivent and

forming a hood over the column; sepals 7–9 mm long, 1.5–2.5 mm wide near the base; petals linear-lanceolate to subfalcate, 7–8 mm long, 1–2 mm wide; lip ovate, concave to conduplicate, 7–8 mm long, 3–4 mm wide, the apex not dilate but papillose, the base with prominent callus, the tip spreading, not sharply recurved. Along streams, bogs, and open seepage areas in cottonwood, tamarix, willow, and pinyon-juniper communities at 1340 to 2075 m in Daggett, Duchesne, Garfield, Utah, and Wayne counties; Washington, Oregon, and California; 8 (0).

Spiranthes romanzoffiana Cham. Hooded Ladies-tresses. Plant erect, stout to slender, glabrous below, pubescent above, 0.8–5 dm tall; roots fleshy, fasciculate; leaves 3–6, basal and cauline, linear-lanceolate, 5–25 cm long, 0.5–1.5 cm wide; flowers creamy white; bracts lanceolate, acuminate, 15–25 mm long, somewhat sheathing; sepals and petals connivent and forming a hood over the column; sepals lanceolate, 8–13 mm long, 3–4 mm wide, the lateral somewhat falcate; petals linear, obtuse, 8–12 mm long, 1–2.5 mm wide; lip pandurate, 8–11 mm long, ca 5 mm wide, constricted above the middle, the apex erose, dilated and without papillae, the basal callosities minute, the tip sharply deflexed; 2n = 30. Bogs to open woods in lodgepole pine, aspen, spruce-fir, and alpine tundra communities at 2700 to 3600 m in Daggett, Duchesne, Juab, Salt Lake, Summit, Tooele, Uintah, Utah, Wasatch, Washington, and Weber counties; Alaska to Newfoundland and southward to California, Arizona, New Mexico, Michigan, and Pennsylvania; 29 (i).

PALMAE A. L. Juss.

Palm Family

Shrubs or trees with terminal clusters of spirally arranged leaves; leaves petiolate, the blades fan-shaped, plaited and palmately divided into segments; spadix elongate, branched, with a spathe at the base of the inflorescence and at the base of each inflorescence branch; flowers perfect or imperfect, regular; sepals 3; petals 3; stamens 6–12; pistil 1, the ovary superior, 3-carpelled; fruit drupaceous; x = 13–18. [Arecaceae Schultz-Schultzenstein].

- 1. Petioles with long fibers at the base, toothed along the margin above the base *Trachycarpus*
- Petioles not with long fibers at the base, coarsely toothed along the margin, the teeth often pronglike *Washingtonia*

Trachycarpus Wendl.

Dioecious or rarely monoecious or polygamous, small to moderate palms; trunks often covered with persistent fibrous leaf sheaths; leaves palmate, divided into 1–ribbed segments, the petiole bases bearing long blackish fibers, the margins armed with small blunt teeth; inflorescence among the leaves, with several thin bracts on the peduncle paniculate; branches not subtended by sheathing bracts; flowers in clusters; sepals 3, basally imbricate; petals 3, imbricate, the male flowers with 6 stamens and 3 small pistillodes; female flowers with 6 staminodes and a pistil; perfect flowers with 6 stamens and a pistil; fruit subglobose.

Trachycarpus wagnerianus Becc. Fan-palm. Shrubs or small trees, mainly less than 3 m tall; leaves to 1 m long or

more, the blades mainly less than 5 dm long, rigid and outstanding, not drooping; seldom flowering. Plants cultivated in Washington County, though frost sensitive and with leaf kill in most years; widely grown in the southern U. S.; origin unknown, though probably Asia; 1 (i).

Washingtonia Wendl.

Small to moderately large palms; trunks covered with persistent leaf bases; leaves palmate, divided into 1-ribbed segments, the petioles armed with spinose teeth or prongs along the margin; inflorescence among the leaves and exceeding them, with several bracts on the peduncle, with bracts subtending each of the several branches; flowers with a tubular calyx; petals tardily deciduous; stamens 6; pistil of 3 carpels, separate except for the united style; fruit 1-seeded, ellipsoid to globose.

Washingtonia filifera (L. Linden) Wendl. Desert Fan-palm; Petticoat Palm. [*Pritchardia filifera* L. Linden]. Trees mainly 3-10 m tall; trunks clothed with hanging persistent leaves (or these trimmed, displaying the leaf bases); leaves to 2 m long or more, the blades green, filiferous; occasionally flowering. Cultivated ornamental in Washington County; Arizona and California; 1 (i). This handsome palm suffers from frost damage in some years, but has been successfully grown for many decades. It should be expected to escape into the seeps and springs around St. George.

POTAMOGETONACEAE Dumort.

Pondweed Family

Aquatic perennial rhizomatous fresh water herbs; stems terete or somewhat flattened, simple or freely branched; leaves submersed or some of them floating, alternate or opposite, simple, entire or minutely toothed, the submersed blades mostly narrower than the floating ones; stipules conspicuous, sheathing, free or fused with the leaf base, deciduous or not; flowers perfect or imperfect, ebracteate, sessile or nearly so, in whorls or on axillary peduncles; perianth of 4 short-clawed distinct segments; stamens 4, attached to the perianth segments; pistils 4, distinct; style short, usually persisting as a short beak; fruit a somewhat flattened achene, with dorsal and lateral keels or obscurely keeled in some species; x = 7?, 13-15.

Potamogeton L.

Aquatic herbs; leaves often dimorphic, the floating often broader and leathery in texture; stipules conspicuous, sometimes sheathing; flowers sessile in pedunculate spikes, usually in whorls.

Correll, D. S. and H. B. Correll. 1972. Aquatic and wetland plants of southwestern United States. Environmental Protection Agency, Washington, D. C.
Cronquist, A., et al. 1977. Intermountain Flora. Vol. 6. Columbia University Press.
Mason, H. L. 1957. A flora of the marshes of California. Univ. California Press, Berkeley.
Hitchcock, C. L., et al. 1969. Vascular plants of the Pacific Northwest. Univ. Washington Publ. Biol. 17(1): 1-914.

- 1. Stipules adnate to the leaf base, forming a sheath enfolding the stem; leaf appearing as though arising from top of sheath 2

- Stipules axillary and free from the leaf base, either free from one another or united to form a cylinder around the stem, or the margins enfolding the stem not united 5
- 2(1). Leaves with auricles at the base, the margins entire, minutely serrulate toward the tip, 3-8 mm wide, 20- to 60-nerved; plants usually sterile *P. robbinsii*
- Leaves without auricles, the margins entire, to 5 mm wide, 1- to 3-nerved 3
- 3(2). Leaves with a long tapering tip, filiform, 0.2-1 mm broad; style present, short; fruit 2.6-4.2 mm long, beaked *P. pectinatus*
- Leaves with obtuse or rounded apex, to 5 mm broad; style lacking; fruit beak wheel-like or lacking 4
- 4(3). Sheaths inflated at the base, usually subtending 2 or more branches, the free stipule tips not producing an obvious ligule; leaves filiform to narrowly linear, 1-2 mm wide; spikes with equally spaced whorls of flowers; plants rare in Utah *P. vaginatus*
- Sheaths not inflated, usually subtending 1 or 2 branches, the free stipular tips projecting upward into a distinct ligule; leaves filiform to linear, 0.2-5 mm wide; spikes with mostly unequally spaced whorls of flowers; plants common *P. filiformis*
- 5(1). Leaves all submersed and essentially alike, the petiole short or lacking 6
- Leaves dimorphic, submersed and floating, the floating with broad blades and long petioles 14
- 6(5). Leaves crispate and serrate, 3-12 mm wide; achenes with a curved beak 2-3 mm long *P. crispus*
- Leaves entire; achene beak various 7
- 7(6). Leaves lanceolate, oblong, or ovate 8
- Leaves linear-filiform or setaceous 10
- 8(7). Leaves sessile or only slightly clasping, usually reddish; beak of fruit 1-1.3 mm long *P. alpinus*
- Leaves clasping 1/3-3/4 around the stem, rarely if ever reddish; beak of fruit not over 1 mm long 9
- 9(8). Stipules conspicuous, 3-10 cm long, persistent; leaves mostly over 10 cm long, the apex usually boat-shaped; fruit over 4 mm long and 3 mm wide at maturity *P. praelongus*
- Stipules inconspicuous, not over 2 cm long and soon reduced to shreds; leaves less than 10 cm long, the apex not boat-shaped; fruit less than 4 mm long and 3 mm wide *P. richardsonii*
- 10(7). Stems strongly flattened and winged; leaves 9- to 35-nerved, 3-5 mm wide; fruits 3-5.5 mm long *P. zosteriformis*
- Stems terete or nearly so, not winged; leaves less than 10-nerved, not over 3 mm wide; fruits less than 3 mm long 11
- 11(10). Leaves without basal glands; peduncle stout, 0.3-1.5 (2) cm long; spikes 2-5 mm long, capitate; fruit compressed, with a thin toothed keel *P. foliosus*
- Leaves often with 2 basal glands; peduncle slender, 1-9 cm long, the spike often over 5 mm long; fruit plump, the keel obscure or lacking 12
- 12(11). Stipules obscure, 0.3-1.4 cm long, not fibrous; stems very slender or capillary and much branched; leaves firm, 3-nerved, 0.3-2 mm wide, with 2 small globose basal glands *P. pusillus*
- Stipules obvious, 0.7-2 cm long, strongly fibrous; stems slender and simple or sparsely branched; plants rare in northern Utah 13

- 13(12). Leaves thin and translucent, (3) 5- to 7-nerved, 1.5-3.5 mm wide, with 2 yellowish glands at the base, the apex rounded; stipules 0.7-1.1 (2) cm long *P. friesii*
- Leaves firm, often revolute, 3-nerved, 0.5-2 (2.5) mm wide, glandless, the apex gradually tapering to a slender tip; stipules 0.8-2 cm long *P. strictifolius*
- 14(5). Submerged leaves thread- or ribbonlike, the sides parallel, less than 8 mm wide 15
- Submerged leaves broader, the sides curving in near the ends, not parallel, over 8 mm wide (except in some *P. gramineus*) 18
- 15(14). Stipules of submerged leaves fused with the bases of the leaves; inflorescences dimorphic, in spikes in the axils of the floating leaves and in small heads in the axils of submerged leaves; plants not definitely known for Utah *P. diversifolius* Raf.
- Stipules not joined with the leaf base; inflorescences alike 16
- 16(15). Floating leaves over 2.5 cm wide, usually cordate or rounded at the base; submerged leaves less than 2.5 mm wide *P. natans*
- Floating leaves less than 2.5 cm wide, usually cuneate at the base; submerged leaves over 2.5 mm wide ... 17
- 17(16). Submerged leaves with a conspicuous reticulated medial band; fruit 2.5-3.5 mm long, definitely keeled; floating leaves usually opposite ... *P. epihydrus*
- Submerged leaves without a reticulated medial band; fruit 1.7-2.5 mm long, slightly if at all keeled; floating leaves usually alternate *P. gramineus*
- 18(14). Floating leaves delicate and translucent, short-petiole, not much differentiated from submerged leaves, except wider, reddish tinged *P. alpinus*
- Floating leaves coriaceous, opaque, the base rounded or cuneate but distinct from the petiole, the blade with 13 or more nerves 19
- 19(18). Submerged leaves all petiolate, the longest petioles over 4 cm long; fruit 3.5-4 mm long when mature, usually reddish *P. nodosus*
- Submerged leaves over 1.5 cm wide, sessile or on petioles to 4 cm long, seldom over 5 times longer than wide, the nerves usually more than 9 *P. illinoensis*

***Potamogeton alpinus* Balbis** Northern Pondweed. Plants partially submerged; stems reddish brown, 1-2 mm thick, terete, simple or rarely branched above, 3-10 dm long; leaves somewhat dimorphic, the submerged ones oblong-linear to linear-lanceolate, 0.5-2 cm wide, 4-18 cm long, rather thin, usually with 7 nerves, delicate, translucent, sessile or slightly clasping, obtuse or rarely acutish, entire; floating leaves elliptical, oblanceolate to obovate or even oblong-linear, 1-2 cm wide, often poorly developed, thin, translucent, tapering, with no sharp distinction to a petiole, 1-3 cm long; stipules thin, membranous, free from the leaf, 1.5-4 cm long, soon withering and deciduous; peduncles 3-10 cm long, usually as thick as the stems; spikes in fruit 1.5-3.5 cm long, dense and compact, with 5-9 whorls; flowers large, the perianth greenish red to red, 1.5-2.5 mm long; style short; fruit 3-4 mm long, obovate, 1- to 3-nerved, the beak curved, 1-1.3 mm long; $2n = 26$. Streams, ponds, and lakes at 2400 to 3850 m in Daggett, Duchesne, Salt Lake, Sevier, Summit, Uintah, and Utah counties; Alaska to Nova Scotia, south to California, Colorado, and the northeastern states; Eurasia; 18 (0). *P. alpinus* is similar to *P. praelongus* but without the whitish flexuous stems.

***Potamogeton crispus* L.** Crisped Pondweed. Plants wholly submerged; stems greenish, compressed, with channeled sides, freely branching above, 4-8 (15) dm long; leaves all submerged, oblong, half-clasping, 2-8 cm long, 5-12 mm wide, 3- to 5 (7) -nerved, rounded apically, the margin crisped and serrulate; stipules axillary, scarious, splitting and becoming fibrillose early, 0.3-0.8 mm long, whitish, often united around the stem to form a sheath; peduncles stout, 3-5 (7) cm long; spikes few-flowered, 1-2 cm long; flowers yellowish, the segments 1.8-3 mm long; fruit ovoid, 3-keeled, 5-6 mm long, with a stout curved beak 2-3 mm long; $2n = 26$, 36, 42, 50, 52, 76, 78. Open water in ponds, streams, and ditches at 1500 to 2330 m in Cache, Daggett, Rich, Salt Lake, Summit, Utah, Wasatch, and Weber counties; widely introduced throughout the world, in the western U. S. as far south as California and Nevada; 10 (0).

***Potamogeton epihydrus* Raf.** Nuttall Pondweed. Stems somewhat flattened, simple or few-branched, 5-20 dm long; leaves dimorphic, the submerged ones linear, sessile, flaccid, (5) 10-20 cm long, 3-10 mm wide, the midvein bordered by several rows of air chambers, the leaves soon decomposing; floating leaves with flattened petioles shorter than the blades, these firm, elliptic to oblong-elliptic, 3-8 cm long, (0.5) 1-2 cm wide; stipules free, not connate, membranous, 1-3 cm long, mostly blunt; peduncles about as thick as the stem, 3-8 cm long; spikes densely flowered, 2-4 cm long in fruit; achenes obliquely broadly ovate, 3-4 mm long, the ventral keel sharp, the lateral ones evident but not as sharp; beak short; $2n = 26$. Shallow to deep slow moving streams, lakes, or ponds, at 2800 to 3000 m in Salt Lake County; Alaska south to California, Idaho, and Colorado, east to Newfoundland and the east-central U. S.; 1 (0).

***Potamogeton filiformis* Pers.** Filiform Pondweed. Plants wholly submerged, arising from creeping, slender, branched rootstock with terminally thickened tubers; stem usually short and much-branched, especially below, 2-6 (9) dm long, subterete, whitish to greenish; leaves all submerged, filiform to linear, rather blunt, 3- to 5-nerved, 5-12 cm long, 0.8-4 (5) mm wide, sheaths 0.5-2 cm long, closed, not swollen, greenish to whitish with a conspicuous hyaline ligule 1-7 mm long; peduncles filiform, 3-10 (15) cm long, with 2-8 whorls of crowded to remote flowers, these small, 1-2.5 mm long, brownish; style short to almost lacking; fruit obovoid, 2-4 mm long, 1.5-3 mm wide, the dorsal keel low and rounded, the 2 lateral keels low and obsolete or lacking; fruiting style a short wartlike beak less than 0.5 mm long. Three varieties are present.

1. Leaves 2-4 (5) mm wide; fruits 3-4 mm long *P. filiformis* var. *latifolius*
- Leaves 0.2-2 mm wide; fruits 2-3 mm long 2
- 2(1). Leaves 0.5-2 mm wide; plants tall, the stems mostly 3-5 (9) dm long; plants common *P. filiformis* var. *occidentalis*
- Leaves 0.2-0.5 mm wide; plants short, the stems mostly 1-3 dm long; plants rare ... *P. filiformis* var. *alpinus*

Var. *alpinus* (Blytt) Asch. & Graebn. [*P. marinus* var. *alpinus* Blytt]. Ponds, lakes, and streams at 2850 m and above in Summit County; Eurasia and North America as far south as Idaho and Colorado; 2 (0).

Var. *latifolius* (Robb.) Reveal [*P. pectinatus* var. *latifolius* Robb.; *P. latifolius* (Robb.) Morong]. Streams, ponds, and lakes at 1500 to 2500 m in Box Elder County; California to Nevada and north to Alaska; 6 (0). At its morphological extreme, var. *latifolius* is easily distinguished from var. *occidentalis*. However, in northern Utah the leaf width of the two blend wholly together and a clear distinction is not always possible.

Var. *occidentalis* (Robb.) Morong [*D. marinus* var. *occidentalis* Robb.]. Shallow ponds, lakes, and slow moving streams at 1500 to 3100 m in Box Elder, Duchesne, Emery, Garfield, Kane, Piute, Rich, Salt Lake, Sanpete, Sevier, Summit, Uintah, Utah, Wasatch, and Washington counties; Alaska to Greenland, south to California, Arizona, Colorado, New Mexico, Michigan, and Pennsylvania; 59 (iii).

***Potamogeton foliosus* Raf.** Leafy Pondweed. Plants wholly submerged; stems flattened, leafy, slender, freely branched, 2–10 dm long; leaves all submerged, linear, 3–10 cm long, 1–2.5 mm wide, 3- to 5-nerved, without basal glands, the apex acute to cuspidate, tapering and sessile at the base, attached directly to the stem; stipules at first connate, later free, soon rupturing and deciduous, fibrillose, the fibers persistent in some, 15–25 mm long; peduncles 0.5–2 cm long; spikes subglobose to subcapitate, congested, 0.1–0.5 cm long, few-flowered; flowers minute, greenish, 0.5–1 mm long; style short; fruit broadly ovoid, 2–2.5 mm long, the dorsal keel prominent, undulate-dentate, the 2 lateral keels obscure; beak 0.2–0.4 mm long; $2n = 26$. Two varieties occur in Utah.

1. Stipules delicate, tending to completely disintegrate, the fibers not persistent; plants common *P. foliosus* var. *foliosus*
- Stipules firm, strongly fibrous, the fibers free at the tip of the stipule, becoming longer as the membranous portion of the stipule disintegrates, persistent; plants uncommon *P. foliosus* var. *fibrillosus*

Var. *fibrillosus* (Fern.) Haynes & Reveal [*P. fibrillosus* Fern.]. Shallow pools, lakes, and slow moving streams at ca 2700 m in Grand and Summit counties; California to Washington, Idaho, and Wyoming; 3 (0).

Var. *foliosus* Shallow pools, lakes, and streams at 1400 to 3050 m in Box Elder, Cache, Daggett, Emery, Duchesne, Grand, Kane, Salt Lake, San Juan, Summit, Uintah, Utah, Wasatch, and Washington counties; British Columbia to Quebec, south to California and Florida; Central America; 30 (ii).

***Potamogeton friesii* Rupr.** Fries Pondweed. Plants wholly submerged; stems slender, simple below, freely branched above, green, flattened, 3–10 dm long; leaves all submerged, narrowly linear, 3–8 cm long, 1.5–3.5 mm wide, mostly 5-nerved, apically rounded but with a mucronate tip, tapering and sessile basally, with 2 yellowish glands just below the point of attachment; stipules at first connate but soon opening, not forming a sheath, 0.7–2 cm long, white, strongly fibrillose and tardily shredded, free from the blade; peduncles somewhat flattened and slightly winged, 1.5–5 cm long; spikes congested, 0.7–2 cm long, with 3–4 whorls of 2–3 flowers each; flowers small, greenish, 1.5–2.5 mm long, the style short; fruit ovoid to obovoid, 1.5–2.5 mm long, the dorsal keel low and rounded, the 2 lateral keels obscure; beak curved, persistent, 0.3–0.8 mm long; $2n = 26$. Shallow lakes and ponds at 2600 to 3100 m in Sevier and Summit counties; Eurasia and North America; Alaska to New

foundland, south to Washington, South Dakota, Indiana, and Virginia; 3 (0).

***Potamogeton gramineus* L.** Grass Pondweed. [*P. gramineus* var. *maximus* Morong; *P. gramineus* var. *myriophyllus* Robb.]. Plants only partially submerged; stems simple to much branched, greenish, terete, 2–8 (15) dm long; leaves dimorphic, the submerged leaves linear to lanceolate or oblanceolate, 1.5–9 cm long, 1–14 (16) mm wide, rather thin, 3–9 (11)–nerved, apically acute, tapering to a sessile base; floating leaves usually present, coriaceous, ovate to elliptical, the blades 2–5 (7) cm long, 1–2.5 cm wide, 13- to 20-nerved, the apex obtuse or somewhat mucronate, the base cuneate or rounded to a petiole 2–10 cm long; stipules free, persistent, 0.5–3 cm long; peduncles 2–10 cm long, with numerous flowers, these large, greenish, 2–3 mm long, the style short; fruits obovoid, 2–2.5 mm long, the dorsal keel sharp and prominent, the 2 lateral keels rounded and obscure, the beak 0.3–0.5 mm long, slightly curved. Slow moving streams, shallow pools, lakes, and swampy areas at 1430 to 3500 m in Beaver, Box Elder, Cache, Daggett, Emery, Garfield, Iron, Salt Lake, San Juan, Sanpete, Sevier, Summit, Uintah, and Utah counties; Alaska to Greenland, south to California, Arizona, Colorado, and the northeastern states; Eurasia; 38 (ii). Our material can be separated into two weak varieties; specimens with submerged leaves 3–8 mm wide are var. *gramineus* and those with leaves 6–16 mm wide are placed in var. *maximus* Morong ex Bennett. However, the morphology is a continuum and the recognition of infraspecific taxa seems to be moot. *P. gramineus* is known to hybridize with *P. illinoensis*.

***Potamogeton illinoensis* Morong** Illinois Pondweed. Stems simple to much branched, terete, to 20 dm long; leaves somewhat dimorphic but transitional; submerged leaves thin, lanceolate to oblong-elliptic or oblanceolate, 6–20 cm long, 2–5 cm wide, subsessile or tapered gradually to the petiolar base, conspicuously 9- to 19-nerved; floating leaves (if any) rather firm, gradually transitional to the submerged ones, the blades mostly broadly elliptic or oblong-elliptic, 4–12 cm long, 2–6 cm wide, the petiole much shorter than the blade, 13- to 29-nerved; stipules 2.5–7 cm long; peduncles mostly thicker than the stem, 4–12 cm long; spikes dense, mostly 3–6 cm long; achenes broadly and obliquely obovoid, ca 3.5 mm long, the dorsal keel conspicuous and sharp, the lateral keels also conspicuous but not so sharp; beak ca 0.5 mm long; $2n = 104$. Ponds, lakes, and other quiet, deep water at ca 2330 m in Cache County; British Columbia to the northeastern U. S., south to California, Nevada, and Colorado; 1 (0). This species is closely allied with *P. nodosus* and *P. gramineus*, and intermediates are known.

***Potamogeton natans* L.** Floating Pondweed. Plants partially submerged; stems simple or nearly so, terete, 1–2 mm thick, 5–18 dm long; leaves dimorphic, the submerged ones coriaceous, linear, 10–20 cm long, 1–2 mm wide, obscurely nerved, sessile; floating blades 4–9 cm long, 2.5–6 cm wide, on long petioles, the blade coriaceous, ovate to oblong, ovate-elliptic, basally cordate or rounded, rarely tapering, apically rounded or obscurely mucronate, with 23–37 nerves; stipules persistent, clasping the stem, whitish, fibrous, 4–11 cm long; peduncles 3–8 cm long; spikes compact, especially in age, 3–5 cm long; flowers large, greenish, 1.5–3 mm long, the style short; fruit 3.5–5 mm long, obovoid, lacking keels,

the beak 0.7–1 mm long; $2n = 52$. Shallow pools or lakes or slow moving streams at 1500 to 3070 m in Rich, Uintah, and Utah counties; Alaska to Newfoundland, south to California, Arizona, New Mexico, and the northeastern U. S.; Eurasia; 7 (0).

Potamogeton nodosus Poir. [*P. fluitans* Roth]. Plants partially submerged; stems terete, simple or branched near the top, 1–1.5 mm thick, 4–20 dm long; leaves dimorphic, the submerged ones thin, lance-linear to lance-elliptic, the blades 9–20 cm long, 1–3.5 cm wide, 7– to 15-nerved, gradually tapering into a long petiole 2–13 cm long, apically acute, the floating blade elliptic to oblong-elliptic, 5–12 cm long, 1.5–4 cm wide, coriaceous, 10– to 20-nerved, apically obtuse, basally cuneate to somewhat rounded, on a long stout petiole arising well below the surface of the water; stipules brownish, often decaying early, linear, 3–6 (9) cm long; peduncles thicker than the stems, 3–15 cm long; spikes dense, with 10–15 whorls, 3–6 cm long in fruit; flowers large, greenish to greenish brown, 1.5–2.5 mm long; style short; fruit obliquely obovoid, 3.5–4 mm long, prominently keeled, brown or reddish when mature; beak erect, short, 0.3–0.5 mm long; $2n = 26$. Ponds and streams or in deeper lakes at 1420 to 3330 m in Box Elder, Cache, Kane, Salt Lake, Sanpete, Summit, Uintah, Utah, and Weber counties; nearly cosmopolitan; 12 (0). This is a distinctive species because of its usually very long petiole-submerged leaves.

Potamogeton pectinatus L. Fennel-leaf Pondweed. Plants wholly submerged, arising from creeping slender branched rootstocks with terminally thickened tubers; stems filiform, ca 1 mm thick, much branched, terete, 3–15 dm long; leaves all submerged, filiform, mostly 1-nerved, attenuate apically, 3–15 cm long, 0.2–0.8 (1) mm wide; sheaths 2–5 cm long, only slightly thicker than the stem, often whitish, with a short hyaline ligule; peduncles filiform, 5–25 cm long, with 2–6 unequally spaced whorls of flowers, these small, obliquely obovoid, 1–1.5 mm long, brownish green; style very short; fruit obliquely ovoid, 2.5–4.2 mm long, 2–3.5 mm wide, the dorsal keel low and rounded, the 2 lateral keels inconspicuous; fruiting style slender, incurved, forming a beak; $2n = 42, 78$. Streams, lakes, ponds, and ditches at 1420 to 2950 m in Box Elder, Cache, Carbon, Davis, Emery, Garfield, Grand, Kane, Millard, Rich, Salt Lake, Sanpete, Sevier, Summit, Uintah, Utah, and Weber counties; Alaska to Newfoundland, south to California, Nevada, Arizona, Colorado, and Florida; Eurasia; Africa; 89 (i). The sharply pointed filiform leaves are distinctive for this species.

Potamogeton praelongus Wulfen Whitestem Pondweed. Plants mostly submerged; stems simple or occasionally branched, whitish or olive green, 10–30 dm long, 1.5–4 mm thick; leaves all submerged, oblong-lanceolate, 10–30 (35) cm long, 1–3 cm wide, 13– to 25-nerved, rounded and hooded apically, basally cordate or rounded and clasping the stem; stipules free, white, oblong-linear to ovate-lanceolate, 5–10 cm long, usually persistent; peduncles clavate, stout, 15–60 cm long; spikes congested, with 6–12 whorls of flowers, 3–5 cm long in fruit; flowers large, greenish, 2–4 mm long, the style short; fruit obovoid, rounded on the back, cuneate at the base, 4–5 mm long, the dorsal keel acute and well developed; beak short, thick, erect, 0.5–0.8 mm long; $2n = 52$. Deep cold water in lakes and slow moving streams

at 1500 to 3120 m in Box Elder, Cache, Duchesne, Garfield, Sevier, and Utah counties; Alaska to Newfoundland, south to California, Colorado, Nebraska, Indiana, and New Jersey; Eurasia; 19 (0). The flexuous white stems are distinctive.

Potamogeton pusillus L. Dwarf Pondweed. [*P. bertholdi* Fieber in Bercht.; *P. pusillus* var. *vulgaris* subvar. *interruptus* Robb., type from Silver Creek, Parleys Park]. Plants wholly submerged; stems capillary, terete or nearly so, usually much-branched, 2–10 dm long; leaves linear, 2–6 cm long, 0.5–2 mm wide, firm, 3-nerved, apically acute to rounded, often mucronate, sessile at the base with 2 small globose glands just below the point of attachment; stipules connate for at least half their length, free from the leaves, hyaline, 6–15 mm long; peduncles filiform, 5–8 cm long; spikes 0.6–1.2 (1.5) cm long, few-whorled, interrupted; flowers small, greenish, 1–2 mm long, the style very short; fruit obliquely ovoid, 2–3 mm long, rounded on the back, obscurely keeled; beak persistent, 0.3–0.5 mm long, short and curved. Shallow pools and lakes and slow moving streams at 1400 to 3330 m in Beaver, Box Elder, Cache, Daggett, Davis, Rich, Salt Lake, Sevier, Summit, Utah, Wasatch, and Weber counties; widespread in North America; Eurasia; Mexico; 15 (0).

Potamogeton richardsonii (Bennett) Rydb. Richardson Pondweed. [*P. perfoliatus* var. *richardsonii* Bennett]. Plants mostly submerged; stems stoutish, terete, sparingly if at all branched, 3–8 dm long; leaves submerged, mostly ovate-lanceolate, 3–10 cm long, 1–2 cm wide, 17– to 29-nerved, cordate and clasping at the base, apically acute to rounded, the margins somewhat crispate; stipules free, whitish, lanceolate to ovate, 1–2 cm long, soon disintegrating into fibers; peduncles stout, enlarged upward, 1.5–20 cm long; spikes congested, with 6–12 whorls, 1.5–4 cm long in fruit; flowers large, greenish, 2.5–4 mm long, the style short; fruit obovate, 2.5–3.5 mm long, the dorsal keel low and rounded, the lateral keels lacking, the persistent beak 0.5–0.8 mm long. Shallow ponds, lakes, and slow moving streams at 1430 to 3000 m in Garfield, Salt Lake, Sevier, Summit, Uintah, and Washington counties; Alaska to Labrador and south to California, Colorado, Nebraska, Indiana, Pennsylvania, and New York; 12 (0).

Potamogeton robbinsii Oakes Robbins Pondweed. Plants wholly submerged; stems stout, much-branched, 1–5 (20) dm long; leaves all submerged, linear, auricled at the base, 2-ranked, stiffly divergent, 4–10 cm long, 4–8 mm wide, the margins thickened and finely serrulate; sheaths 1–1.5 (2) cm long, white, adnate to the base of the leaf, persistent, the upper portion forming a long hyaline ligule, this ultimately fibrous; peduncles reddish, 3–10 cm long; spikes stiff, interrupted, 0.7–2 cm long, loosely flowered; flowers small, reddish to greenish yellow, 1–1.8 mm long, the style short; fruit obliquely obovoid, 3.5–4.5 mm long, the dorsal keel sharp and prominent, the 2 lateral keels low and rounded, the beak subapical, curved, and 0.7–0.9 mm long; $2n = 52$. Quiet deep water in lakes and streams at 2900 m in Rich (?) and Sevier counties; British Columbia to Labrador, south to California, Wyoming, Indiana, and Pennsylvania; 1 (i).

Potamogeton strictifolius Bennett Plants wholly submerged; stems slender, simple or few-branched, greenish, 1–10 dm long; leaves all submerged, the blade linear, 2–7 cm long, 0.5–2 (2.5) mm wide, firm or rigid,

3-nerved, apically obtuse, often mucronate, tapering and sessile basally, attached directly to the stem, without basal glands; stipules connate into a tubular sheath 0.8–2 cm long, this soon rupturing and deciduous, fibrillose, free from the blade; peduncles filiform, 1–9 cm long; spikes 0.8–1.5 cm long, interrupted, with 3 or 4 remote whorls of flowers, these small, greenish, 1.3–1.8 mm long, the style short; fruit obliquely ovoid, 2–3 mm long, the dorsal keel prominent but low and rounded, the lateral keels obscure; beak curved to almost erect, 0.3–0.7 mm long, positioned on the ventral margin. Lakes and slow moving streams, known in Utah from a single collection (taken in 1869) along the Bear River (Summit County?); eastern Canada and the northeastern U. S., west to Nebraska; 0 (0). Our material has been assigned to var. *rutiloides* Fern.

Potamogeton vaginatus Turcz. Sheathed Pondweed. Plants wholly submerged; stems freely branched, terete, greenish, 2–7 dm long; leaves all submerged, the blade filiform to linear, 2–12 (15) cm long, 1–2 mm wide, mostly 1-nerved, apically rounded or obtuse; stipules adnate to the base of the leaf and forming a closed, clasping sheath around the stem, the sheath and main stem usually brownish and swollen, especially at the base, enclosing several branches, 2–6 cm long, with a short rather conspicuous ligule; peduncles slender, 3–15 cm long; spikes moniliform (1) 3–8 cm long, with 4–9 rather evenly spaced whorls of flowers to ca 1 cm apart; flowers small, brownish, 1.5–2 mm long, the style lacking; fruit obovoid, 3–3.5 mm long, the dorsal keel low and inconspicuous, the 2 lateral keels lacking; fruiting stigma broad, sessile, persistent on a wartlike projection well to the side of the fruit; 2n = 78. Ponds, pools, streams, and lakes at 1450 to 2730 m in Garfield and Utah counties; Alaska to Newfoundland, south to Oregon, Idaho, Wyoming, Wisconsin, and New Jersey; Eurasia; 2 (0).

Potamogeton zosteriformis Fern. Eelgrass Pondweed. [*P. compressus* authors, not L.]. Plants wholly submerged; stems flattened and somewhat winged, (1) 2–3 mm broad, constricted at the nodes, freely branched, to 6 dm long; leaves all submerged, linear, to 20 cm long, (2) 3–5 mm wide, many-nerved, narrowed slightly at the base, but not at all clasping; stipules free, 1–3 (4) cm long, often whitish, firm, but eventually shredding; peduncles stout, flattened, to 10 cm long; spikes 1–2.5 cm long, the whorls of flowers continuous; achenes obliquely oblong, 3.5–4.5 mm long, with a narrow sharp somewhat undulate to dentate dorsal keel, the lateral keels obscure; beak persistent, slightly curved, ca 0.7 mm long. Usually in lakes at ca 2970 m in Sevier County; British Columbia to California and east to Montana and the northeastern U. S. and Canada; 3 (0).

RUPPIACEAE Hutch.

Ditchgrass Family

Slender submersed branching aquatic perennial herbs; leaves alternate or rarely opposite, with sheathing adnate stipules; flowers perfect, enclosed in sheathing leaf bases, small, typically 2 per terminal spike; perianth lacking; stamens commonly 2, the anthers with a broad connective; pistils 4, the stigma broad and flat; fruit a drupelet; n = 8, 10.

Ruppia L.

Stems and leaves filiform; peduncles elongating and spirally coiled at maturity; flowers with 2 sessile anthers and 4 pistils sessile in flower and elevated on elongated stipes in fruit.

Fernald, M. L. and K. M. Weigand. 1914. The genus *Ruppia* in eastern North America. *Rhodora* 16: 119–27.

Ruppia maritima L. Ditchgrass. Stems terete or nearly so, to 8 dm long; leaves 2–20 cm long or more, linear to filiform, sessile atop the sheathing adnate stipules, these membranous, commonly 2 to several times broader than the stem, entirely adnate to the leaf base or the tips free for 1–2 mm, enclosing the flowers; flower spikes axillary, the peduncles elongating as the fruits develop and finally 3–20 cm long or more and straight or coiled; drupelets 1.5–3 mm long, obliquely ovoid; 2n = 20. Brackish water of ditches, ponds, and marshes at 1280 to 1525 m in Box Elder, Juab, Millard, Salt Lake, Tooele, Uintah, Utah, and Weber counties; almost cosmopolitan; 15 (0).

SPARGANIACEAE Rudolphi

Bur-reed Family

Perennial aquatic herbs from creeping rhizomes; stems erect or floating, simple or branched; leaves alternate, linear, entire, sheathing at the base; flowers imperfect in dense globular heads on the upper portion of the stem, the staminate above the pistillate, the pistillate subtended by leafy bracts; stamens of the staminate flowers 3 or more, subtended by 3–5 chaffy bracts, the filaments longer than the anthers and bracts; pistil 1, the ovary mostly 1-loculed, with 3–6 short chaffy bracts; fruit nut-like, hardened, 1-seeded (or 2 when 2-loculed); x = 15.

Sparganium L.

A single genus with characters of the family.

- 1. Style branched (often breaking off leaving only the beak); stigmas 2; mature achenes truncate apically; inflorescence often compound *S. eurycarpum*
- Style not branched; stigma 1; mature achenes gradually tapering into the beak; inflorescence not branched 2
- 2(1). Staminate heads mostly 1 or 2; beak of achene 1–1.5 mm long (including stigma); anthers at least half as wide as long; leaves mostly 3–6 mm wide *S. minimum*
- Staminate heads mostly 2 or more; anthers 2–3 times longer than wide 3
- 3(2). Leaves mostly less than 5 mm wide, the margins not scarious; achene beak and stigma together 2 mm long or less *S. angustifolium*
- Leaves mostly over 5 mm wide, the margins often scarious at the base; achene beak and stigma together 3–4 mm long *S. emersum*

Sparganium angustifolium Michx. Narrowleaved Bur-reed. [*S. natans* var. *angustifolium* Pursh; *S. simplex* var. *angustifolium* Torr.]. Herbaceous perennial, 2–4 dm tall; stems erect or floating; leaves linear, 10–80 cm long, 1–8 mm wide, flat but rounded dorsally, dilated below; inflorescence simple, with 2–5 staminate heads and 2–4 pistillate heads; perianth scalelike, clawed, 1–2 mm long; anthers and stigma ca 1 mm long; the stigma solitary; fruit of achenes in globose heads, the beak 2 mm long or less; 2n = 30. Ponds, lake shores, bogs, and potholes, usually in shallow water, at 2135 to 3160 m in Cache, Daggett, Duchesne, Emery, Garfield, Grand, Iron, Summit, Uin-

tah, and Utah counties; over much of North America; Eurasia; 22 (0).

Sparganium emersum Rehm. Emerged Burreed. [*S. simplex* var. *emersum* Asch. & Graebn.; *S. simplex* var. *multipedunculata* Morong; *S. multipedunculatum* Rydb.; *S. emersum* var. *pedunculatum* Reveal]. Perennial herbs with erect stems 2–4 (6) dm tall; leaves linear, mostly 20–50 cm long, 5–12 mm wide, much longer than the inflorescence, the margin scarios below where expanded; inflorescence simple (usually), the pistillate heads (1) 2–4 (5), staminate heads (1) 2–4; perianth scales somewhat broadened at apex and erose, 2–4 mm long; stigma 1; fruit short-stipitate, 1–3 cm broad, 1-seeded, the beak stout, 3–5 mm long; 2n = 30. Shallow water of ponds, marshy meadows, and lakes at 2135 to 2930 m in Daggett, Davis, Duchesne, Garfield, Grand, Morgan, Sanpete, Sevier, Summit, Uintah, and Wayne counties; over much of North America; Eurasia; 9 (0).

Sparganium eurycarpum Engelm. Erect herbaceous perennials with stout, branching stems, 6–12 dm tall; leaves linear, 3–8 dm long, 7–14 mm wide; inflorescence branched, 20–30 cm long, staminate heads 5–10 (12), pistillate heads 1–2, at maturity 15–25 mm thick; perianth scales 3–7 mm long, expanded apically; anthers 1–1.5 mm long; style branched, the 2 branches 2 mm long; fruits truncate, abruptly narrowed to the beak, this 3–4 mm long (not including the style branches); 2n = 30. Swamps, bogs, and marshes at 1373 to 1525 m in Box Elder, Cache, Davis, Garfield, Salt Lake, and Utah counties; British Columbia, south to Baja, east to Newfoundland and Florida; 7 (0).

Sparganium minimum Fries Small Burreed. Aquatic herbaceous perennials with weak, emerged, slender stems, 1–3 dm high (longer when floating); leaves flat, floating or erect, mostly 3–6 mm wide, equaling or a little exceeding the inflorescence, this simple, 2–6 cm long, flower heads 2–4, upper one staminate or with both male and female flowers, the lower ones mixed or pistillate, the pistillate 6–12 mm thick; anthers at least half as long as broad, 0.3–0.6 mm long; perianth scales small, ca 1 mm long, styles simple, the stigma up to 1 mm long; fruits ellipsoid, the body 2–3 mm long, abruptly contracted into a short beak 0.6–1 mm long (including the stigma); 2n = 30. Shallow ponds and lakes, often in muck, at ca 3000 m in Duchesne, Summit, and Uintah counties; Labrador to Alaska, south to California, Montana, Tennessee, and New Jersey; Eurasia; 4 (0).

TYPHACEAE A. L. Juss.

Cattail Family

Tall herbaceous semiaquatic or aquatic perennials from creeping, thick rhizomes; stems erect, simple, terete, pithy; leaves alternate, long, linear, flat, sheathing; flowers densely crowded in terminal, cylindrical, spike-like inflorescences, unisexual; true perianth lacking; staminate flowers above, sessile, subtended by bristles, the stamens 2–5; pistillate flowers composed of fertile and sterile ones, the fertile with a stipitate ovary and an elongate style and stigma, the sterile on slender stipes, hairy below and clubshaped apically; ovary superior, 1-loculed; fruit dry, tardily dehiscent; x = 15.

Typha L.

The family consists of a single genus, with characteristics of the family.

- 1. Pistillate portion of spike (the lower part) dark brown, velvety, typically contiguous with the staminate (or upper part); pistillate flowers lacking subtending bracts; stigmas dilated apically, dark brown *T. latifolia*
- Pistillate portion of the spike pale to cinnamon brown, typically separated by an interval from the staminate spike; pistillate flowers with subtending bracts; stigmas not dilated apically, pale brown 2
- 2(1). Leaf sheaths auriculate, closed at the throat; spikes green at anthesis; plants known from Cache County *T. x glauca*
- Leaf sheaths not auriculate, open at the throat; spikes brown at anthesis; plants widely distributed *T. domingensis*

Typha domingensis Pers. Common Cattail. [*T. angustifolia* var. *domingensis* (Pers.) Griseb.]. Plants mainly 1.5–4 m tall; leaves 6–9 per stem, equaling the spikes, 3–14 mm wide, plano-convex, pale yellow green; pistillate spikes 7.5–33.5 cm long, 0.5–2.8 cm thick, pale cinnamon brown; bracts brownish; staminate and pistillate spikes typically separated by a sterile portion 1.3–2.5 cm long; stigma brownish, linear; staminate spikes 11–22 cm long, 0.8–1 cm thick, with golden yellow pollen and brownish simple bracts; filaments branched; 2n = 30. Seeps, springs, canyon bottoms, and wet meadows at 1065 to 1830 m in Box Elder, Cache, Davis, Emery, Garfield, Grand, Juab, Kane, Millard, San Juan, Tooele, Uintah, Utah, Washington, and Wayne counties, and probably in all other counties; Oregon to Oklahoma, south to California, Nevada, Arizona, New Mexico, Texas, Mexico, and South America; 22 (ii).

Typha glauca Gordon (hybrid). Plants typically 1.5–3 m tall; leaves 8–12 per stem, usually exceeding the spikes, dark bluish green, the sheath closed above and auriculate; pistillate spikes 10–25 cm long, 1.8–2.5 cm wide, red brown, the flowers usually lacking bracts, short-pedicellate, the stigmas red brown, linear-lanceolate, staminate spikes pale brown. Marshes and in shallow water, reported from Cache County, near Logan (Cronquist et al. 1977); widely distributed in North America; 0 (0). This hybrid is the result of crosses between *T. latifolia* and *T. domingensis*, and is probably more widely distributed in Utah.

Typha latifolia L. Broad-leaved Cattail. [*Massula latifolia* (L.) Dulac]. Plants mainly 1–3 m tall; leaves 12–16 per stem, equaling the spikes, 7–16 mm wide, nearly flat, green, the sheaths open, cylindrical, not auriculate; pistillate spikes 6–18 cm long, 1.8–3.5 cm wide, dark brown, the flowers lacking bracts, but pedicellate; stigmas medium to dark brown, lance-ovate; interval between the spikes typically lacking; staminate spikes pale brown, lacking bracts; stamens on branched filaments; 2n = 30. Marshy areas and slow moving water at 1280 to 2105 m in Box Elder, Cache, Daggett, Davis, Emery, Juab, Kane, Millard, San Juan, Salt Lake, Sevier, Tooele, Uintah, Utah, Wasatch, and Wayne counties; throughout North America; Mexico; Eurasia; Africa; 31 (i).

ZANNICHELLIACEAE Dumort.

Horned Pondweed Family

Perennial submersed aquatic monoecious herbs with creeping rhizomes; stems slender, usually branched; leaves opposite or crowded at the nodes, with adnate sheathing and usually ligulate stipules; flowers minute, imperfect, axillary, solitary or cymose; perianth of 3 scales or lacking; stamens 1; pistils 1–9, the ovary 1-loculed, 1-carpelled, the stigmas 1; fruit an achene.

Zannichellia L.

Stems slender; leaves opposite; flowers axillary; staminate flowers with 1 stamen, the filament slender; pistillate

flowers sessile or short pedunculate subtended by a short hyaline bract, mostly with 3–5 pistils.

Zannichellia palustris L. Horned Pondweed. Submersed herbs with slender stems to 4 dm long or more; leaves opposite, 2–10 cm long, linear-filiform, 1-veined; staminate flowers with slender filaments; pistillate flowers sessile or short-pedunculate; fruit short-stipitate to subsessile, the body compressed, lunately curved, the keel often denticulate; styles less than half as long as the body. Ponds, streams, and irrigation canals at 1310 to 2595 m in Davis, Millard, Morgan, Salt Lake, San Juan, Sevier, Tooele, Uintah, and Utah counties; widely distributed in North America; Eurasia; Africa; 24 (iii).

Bjorkman Sven Oscar Bjorkman (1920–1956)
Blake Sidney Faye Blake (1892–1959)
Blank. Joseph William Blankinship (1862–1938)
Bluff & Fingerh. Mathias Joseph Bluff (1805–1837) and Karl Antoine Fingerhuth (1802–1876)
Blume Carl Ludwig von Blume (1796–1862)
Blytt Mathias Numsen Blytt (1789–1862)
Boeck. Johann Otto Boeckeler (1803–1899)
Boiss. Pierre Edmond Boissier (1810–1885)
Boissev. & Davids. Charles Hercules Boissevain (1893–1946) and Carol Davidson
Boissevain Charles Hercules Boissevain (1893–1946)
J. Boivin Joseph Robert Bernard Boivin (b. 1916)
Bolander Henry Nicholas Bolander (1831–1897)
Bong. August Heinrich von Bongard (1786–1839)
Bonpl. Aime Jacques Alexandre (ne Goujoud) Bonpland (1773–1858)
F. Boott Francis Boott (1792–1863)
W. Boott William Boott (1805–1887)
Borbas Vincze von Borbas (1844–1905)
Boreau Alexandre Boreau (1793–1875)
Borkh. Moritz Balthazar Borkhausen (1760–1806)
Borner Carl Julius Bernard Borner [also Boerner] (b. 1880)
Bornm. Joseph Friedrich Nicolaus Bornmuller (1862–1948)
Bory Jean Baptiste Georges (Genevieve) Marcellin Bory de Saint-Vincent (1778–1846)
Botsch. Victor P. Botschantzev (b. 1910)
Bowden Wray Merrill Bowden (b. 1914)
Brack. William Dunlop Braekenridge (1810–1893)
Brainerd Ezra Brainerd (1844–1924)
Brand August Brand (1863–1930)
K. Brandegee Mary Katharine (nee Curran) Brandegee (1844–1920)
Brandegee Townsend Stith Brandegee (1843–1925)
Branner & Coville John Casper Branner (1850–1922) and Frederick Vernon Coville (1867–1937)
A. Br. Alexander Carl Heinrich Braun (1805–1877)
Brayshaw T. C. Brayshaw (publ. 1965)
Breistr. Maurice A. F. Breistroffer (b. 1906/10)
Breitung August J. Breitung (b. 1913)
Brenckle & Cottam Jacob Frederick Brenckle (b. 1875) and Walter Page Cottam (b. 1894)
Brewer William Henry Brewer (1828–1910)
Brewer & Wats. William Henry Brewer (1828–1910) and Sereno Watson (1826–1892)
Briot Pierre Louis Briot (1804–1888)
Briq. John Isaac Briquet (1870–1931)
Britt. Nathaniel Lord Britton (1859–1934)
Britt. & Br. Nathaniel Lord Britton (1859–1934) and Addison Brown (1830–1913)
Britt. & Rose Nathaniel Lord Britton (1859–1934) and Joseph Nelson Rose (1862–1928)
Britt. & Rusby Nathaniel Lord Britton (1859–1934) and Henry Hurd Rusby (1855–1940)
Britt. & Shafer Nathaniel Lord Britton (1859–1934) and John Adolph Shafer (1863–1918)
B.S.P. Nathaniel Lord Britton (1859–1934), Emerson Ellick Sterns (1846–1926) and Justus Ferdinand Poggenburg (1840–1893)
Broome C. Rose Broome (publ. 1976)
R. Br. Robert Brown (1773–1858)
Brummitt Richard Kenneth Brummitt (b. 1937)
Buch.-Ham. Francis Buchanan-Hamilton (1762–1829)
Buch. Franz Georg Philipp Buchenau (1831–1906)
Buehholz John Theodore Buehholz (1888–1951)
Buckley Samuel Botsford Buckley (1809–1884)
Bunge Alexander Andrejewitsch von Bunge (1803–1890)
Burgsd. Friedrich August Ludwig Burgsdorf (1747–1802)
Burman Johannes Burman (1706–1779)
Burman f. Nicolaas Laurens Burman (1734–1793)
Butters Frederic King Butters (1878–1945)
Butters & Abbe Frederic King Butters (1878–1945) and Ernst Cleveland Abbe (b. 1905)
Butters & St. John Frederic King Butters (1878–1945) and Harold St. John (b. 1892)
Calder & Taylor J. A. Calder (b. 1915) and Raymond Leech Taylor (b. 1901)
Camp Wendell Holmes Camp (1904–1963)
Campbell Douglas Houghton Campbell (1859–1953)
G. R. Campbell Gloria R. Campbell (publ. 1952)
Camus Edmond Gustave Camus (1852–1915)
Canby William Marriot Canby (1831–1904)
Candargy Paleologos C. Candargy (b. 1870)
Carr. Elie Abel Carriere (1818–1896)
Carruth James Harrison Carruth (1807–1896)
Cassidy James Cassidy (1844–1889)
Cassini Alexandre Henri Gabriel Cassini (Comto de) (1781–1850)
Cav. Antonio Jose Cavanilles (1745–1804)
Cesati Vincenzo Cesati (1806–1883)
Chaix Dominique Chaix (1731–1800)
C. & S. Ludolf Karl Adalbert von Chamisso (1781–1838) and Diederich Franz Leonhard von Schlectendal (1794–1866)
Cham. Ludolf Karl Adalbert von Chamisso (1781–1838)
Chatel. Jean Jacques Chatelain (1736–1822)
Chatterley Louis Matthew Chatterley (b. 1951)
Chaudhri Mohammad Nazeer Chaudri (b. 1932)
Chia Liang-Chi Chia (fl. 1955)
Chiov. Emilio Chiovenda (1871–1941)
Choisy Jacques Denys Choisy (1799–1859)
C. Chr. Carl Frederick Albert Christensen (1872–1942)
Chrtek Jindrich Chrtek (b. 1930)
Chuang & Heckard Tsan-Lang Chuang (b. 1933) and Lawrence R. Heckard (b. 1923)
Church George Lyle Church (b. 1905)
Cirillo Domenico Maria Leone Cirillo (also Cyrillo) (1730/39–1799)
Clapham Arthur Roy Clapham (b. 1904)
S. Clark Stephen L. Clark (b. 1940)
C. B. Clarke Charles Baron Clarke (1832–1906)
Clausen Jens Christian Clausen (1891–1969)
R. T. Clausen Robert Theodore Clausen (b. 1911)
Clayton John Clayton (1686–1773)
Clokey Ira Waddell Clokey (1878–1950)
Clover Elzada Urseba Clover (b. 1897)
Clover & Jotter Elzada Urseba Clover (b. 1897) and Mary Lois Jotter (b. 1914)
Clute Willard Nelson Clute (1869–1950)
Cockerell Theodore Dru Alison Cockerell (1866–1948)
Congdon Joseph Whipple Congdon (1834–1910)

- Conrad Solomon White Conrad** (1779–1831)
Constance Lincoln Constance (b. 1909)
Copel. Edwin Bingham Copeland (1873–1964)
Correll Donovan Stewart Correll (b. 1908)
Cory Victor Louis Cory (b. 1880)
Cosson Ernest Saint-Charles Cosson (1819–1889)
Cottam Walter Page Cottam (b. 1894)
Coult. John Merle Coulter (1851–1928)
Coult. & Nels. John Merle Coulter (1859–1928) and **Aven Nelson** (1859–1952)
Coult. & Rose John Merle Coulter (1851–1928) and **Joseph Nelson Rose** (1862–1928)
Coulter Thomas Coulter (1793–1843)
Covas Guillermo Covas (b. 1915)
Cov. Frederick Vernon Coville (1867–1937)
B. Cox Billy J. Cox
Craig Thomas Theodore Craig (b. 1907)
Crantz Heinrich Johann Nepomuk von Crantz (1722–1797)
Crepin Francois Crepin (1830–1903)
Critchf. William B. Critchfield
Cronq. Arthur John Cronquist (b. 1919)
Cronq. & Keck Cronquist, Arthur John (b. 1919) and **David Daniels Keck** (b. 1903)
Crosswhite Frank Samuel Crosswhite (b. 1940)
Curran Mary Katherine Curran (1844–1920)
Cutler Hugh Carson Cutler (b. 1912)
Czernj. Vassili Matveievich Czernjaew (1796–1871)
Dalle Torre Karl Wilhelm von Dalle Torre (1850–1928)
Dandy James Edgar Dandy (1903–1976)
Daniels Francis Potter Daniels (1869–1947)
Danser Benedictus Hubertus Danser (1891–1943)
Darby John Darby (1804–1877)
Darlington Josephine Darlington (b. 1905)
Daston J. S. Daston (publ. 1946)
Daubs Edwin Horace Daubs (publ. 1965)
Daveau Jules Alexandre Daveau (1852–1929)
A. Davidson Anstruther Davidson (1860–1932)
R. J. Davis Ray Joseph Davis (b. 1895)
Davy Joseph Burt Davy (1870–1940)
Day Alva Day (b. 1920)
Dayton William Adams Dayton (1885–1958)
DC. Augustin Pyramus de Candolle (1778–1841)
A. DC. Alphonse Louis Pierre Pyramus de Candolle (1806–1893)
A. & C. DC. Alphonse Louis Pierre Pyramus de Candolle (1806–1893) and **Anne Casimir Pyramus de Candolle** (1836–1918)
Deene. Joseph Decaisne (1807–1882)
Degl. Jean Vincent Yves Degland (1773–1841)
Delaroché Daniel Delaroché (1743–1812)
Dempster Lauramay Tinsley Dempster (b. 1905)
Dempst. & Ehrend. Lauramay Tinsley Dempster (b. 1905) and **Friedrich Ehrendorfer** (b. 1927)
Desf. Rene Louiche Desfontaines (1750–1833)
Desmarais Yves Desmarais (publ. 1952)
Desr. Louis Auguste Joseph Desrousseaux (1753–1838)
Desv. Auguste Nicaise Desvaux (1784–1856)
Detl. LeRoy Ellsworth Detling (1909–1967)
Dewey Chester Dewey (1784–1867)
D. Dewey Douglas R. Dewey
Dieck Georg Dieck (1847–1925)
Diels Friedrich Ludwig Emil Diels (1874–1945)
Dietr. Friedrich Gottlieb Dietrich (1768–1850)
A. Dietr. Albert Gottfried Dietrich (1795–1856)
D. Dietr. David Nathaniel Friedrich Dietrich (1800–1888)
Dippel Leopold Dippel (1827–1914)
Dode Louis-Albert Dode (1875–1943)
Dole William Herbert Dole (b. 1869)
Domin Karel Domin (1882–1953)
D. Don David Don (1799–1841)
G. Don Georg Don (1798–1856)
Donn James Donn (1758–1813)
Dorn Robert D. Dorn (publ. 1977)
Dougl. David Douglas (1798–1834)
Drejer Solomon Thomas Nicolai Drejer (1813–1842)
Drew William Brooks Drew (b. 1908)
E. Drew Elmer Reginald Drew (1865–1930)
Druce George Claridge Druce (1850–1932)
Drury W. H. Drury (fl. 1952)
Duchesne Antoine Nicolas Duchesne (1747–1827)
Dugle Janet R. Dugle (publ. 1966)
Duhamel Henri Louis Duhamel du Monceau (1700–1781)
Dulac Joseph Dulac (1827–1897)
Dum-Cours. George Louis Marie Dumont de Courset (1746–1824)
Dumort. Barthelemy Charles Joseph Dumortier (1797–1878)
Dunal Michel Felix Dunal (1780–1856)
Dunn David Baxter Dunn (b. 1917)
Dunn & Harmon David Baxter Dunn (b. 1917) and **William E. Harmon**
Durand Elias Magloire Durand (1794–1873)
Dur. & Hilg. Elias Magloire Durand (1794–1873) and **Theodore Charles Hilgard** (1828–1875)

- Hoffsgg.** Johann Centurius von Hoffmannsegg (1766–1849)
- H. T. Holm** Herman Theodor Holm (1854–1932)
- A. & N. Holmgren** Arthur Hermann Holmgren (b. 1912) and Noel Herman Holmgren (b. 1937)
- Holmgren, Shultz & Lowrey** Arthur Hermann Holmgren (b. 1912), Leila M. Shultz (b. 1946) and Timothy K. Lowrey
- N. Holmgren** Noel Herman Holmgren (b. 1937)
- N. & P. Holmgren** Noel Herman Holmgren (b. 1937) and Patricia (nee Kern) Holmgren (b. 1940)
- P. Holmgren** Patricia (nee Kern) Holmgren (b. 1940)
- Holub** Josef Holub (b. 1930)
- Holz.** John Michael Holzinger (1853–1929)
- Honck.** Gerhard August Honckeney (1724–1805)
- Hook.** f. Joseph Dalton Hooker (1817–1911)
- Hook. & Baker** Joseph Dalton Hooker (1817–1911) and John Gilbert Baker (1834–1920)
- Hook.** William Jackson Hooker (1785–1865)
- H. & A. William** Jackson Hooker (1785–1865) and George Arnott Walker Arnott (1799–1868)
- Hook. & Grev.** William Jackson Hooker (1785–1865) and Robert Kaye Greville (1794–1866)
- Hopkins** Milton Hopkins (b. 1906)
- Hoppe** David Heinrich Hoppe (1760–1846)
- Horan.** Paul Fedorowitsch Horaninow (1796–1865)
- Horkel** Johann Horkel (1769–1846)
- Hornem.** Jens Wilken Hornemann (1770–1841)
- Horton** James H. Horton (b. 1931)
- Hort.** Hortulanorum, means of the gardeners.
- Host** Nicolaus Thomas Host (1761–1834)
- House** Homer Doliver House (1878–1949)
- J. T. Howell** John Thomas Howell (b. 1903)
- Howell** Thomas Jefferson Howell (1842–1912)
- Hu & Cheng** Shiu-ying Hu (b. 1910) and Ching-yung Joyce Cheng (b. 1919)
- C. E. Hubbard** Charles Edward Hubbard (b. 1900)
- Hubb.** Frederic Tracy Hubbard (1875–1962)
- Hudson** William Hudson (1730–1793)
- Hulten** Oskar Eric Gunnar Hulten (1894–1981)
- H.B.K.** Friedrich Wilhelm Heinrich Alexander von Humboldt (1769–1859), Aime Jacques Alexandre Bonpland (1773–1858) and Karl Sigismund Kunth (1788–1850)
- Humb.** Friedrich Wilhelm Heinrich Alexander von Humboldt von (1769–1859)
- Hutch.** John Hutchinson (1884–1972)
- Huth** Ernest Huth (1845–1897)
- Hylander** Nils Hylander (1904–1970)
- Iltis** Hugh Hellmut Iltis (b. 1925)
- Irmseher** Edgar Irmseher (1887–1968)
- W. Irv.** Walter Irving (1867–1934)
- Isely** Duane Isely (b. 1918)
- Ives** Joseph Christmas Ives (1828–1868)
- A. B. Jackson** Albert Bruce Jackson (1876–1947)
- R. Jackson** Raymond C. Jackson (b. 1928)
- Jacq.** Nicolaus Jacquin (1727–1817)
- Jaeger** Hermann Jaeger (1815–1890)
- James** Edwin James (1797–1861)
- Jancz.** Eduard Janczewski von Clinka (1846–1918)
- Jarm.** A. V. Jarmolenko (1905–1944)
- Jaub.** Hyppolyte Francois Jaubert (1798–1874)
- Jepson** Willis Linn Jepson (1867–1946)

- Jepson & Bailey Willis Linn Jepson (1867–1946) and Liberty Hyde Bailey (1858–1954)
- B. L. Johnson** B. Lennart Johnson (b. 1909)
- Johnston** Ivan Murray Johnston (1898–1960)
- J. R. Johnston** John Robert Johnston (b. 1880)
- M. C. Johnston** Marshall Conring Johnston (b. 1930)
- Jones** Marcus Eugene Jones (1852–1934)
- G. Jones** George Neville Jones (1904–1970)
- Q. Jones** Quentin Jones (b. 1920)
- Jonsel** Bengt Edvard Jonsel (b. 1936)
- Jordan** Alexis Jordan (1814–1897)
- Juss.** Christophe de Jussieu (1685–1758)
- A. L. Juss.** Antoine Laurent de Jussieu 1748–1836
- Juz.** Sergei Vasilievic Juzepczak (1893–1959)
- Kapoor** Brij Mohan Kapoor (b. 1936)
- Kar. & Kir.** Grigorij Silyic Karelin (1801–1872) and Ivan Petrovic Kirilow (1821 or 1822–1842)
- Karsten** Carl Wilhelm Gustav Hermann Karsten (1817–1908)
- Kass** Ronald J. Kass
- Kaulf.** Georg Friedrich Kaulfuss (1786–1830)
- Kearney** Thomas Henry Kearney (1874–1956)
- Kearney & Peebles** Thomas Henry Kearney (1874–1956) and Robert Hibbs Peebles (1900–1955)
- Keck** David Daniels Keck (b. 1903)
- Kellogg** Albert Kellogg (1813–1887)
- Kelso** Leon Hugh Kelso (b. 1907)
- H. Keng** Hsuan Keng (b. 1923)
- Kenn.** Patrick Beveridge Kennedy (1874–1930)
- Kenney** Patricia Kenney (fl 1977)
- Ker** John Bellenden Ker (previously John Gawler) (1764–1842)
- Kerner** Anton Joseph Kerner von Marilaun (1831–1898)
- King** George King (1840–1909)
- Kiob.** (publ. ca 1770)
- Kit.** Paul Kitaibel (1757–1817)
- Kittell** Marie Teresa Kittell (b. 1892)
- W. Klein** William Klein (publ. 1962)
- Klotzsch** Johann Friedrich Klotzsch (1805–1860)
- Knerr** Ellsworth Brownell Knerr (1861–1942)
- Knuth** Reinhard Gustav Paul Knuth (1874–1957)
- K. Koch** Karl Heinrich Emil Ludwig Koch (1809–1879)
- Koch** Wilhelm Daniel Joseph Koch (1771–1849)
- Koehne** Bernard Adalbert Emil Koehne (1848–1918)
- Koeler** George Ludwig Koeler (1765–1807)
- Koenig** Carl Dietrich Eberhard Koenig (1774–1851)
- Koen. & Sims** Carl Dietrich Eberhard Koenig (1774–1851) and John Sims (1740–1831)
- Koern.** Friedrich August Koermicke (1828–1908)
- Koidz.** Genichi Koidzumi (1883–1953)
- Komarov** Vladimir Leontjevic Komarov (1869–1945)
- Kozo-Polj.** Boris Mikhailovic Kozo-Poljansky (1890–1957)
- Krap.** Antonio Krapovickas (publ. 1970)
- Krause** Ernst Hans Ludwig Krause (1859–1942)
- Kuhn** Friedrich Adalbert Maximilian Kuhn (1842–1894)
- Kukenthal** Georg Kukenthal (1864–1955)
- Kunth** Karl Sigismund Kunth (1788–1850)
- Kuntze** Carl Ernst Otto Kuntze (1843–1907)
- Kunze** Gustav Kunze (1793–1851)
- Kurz** Wilhelm Sulpiz Kurz (1834–1878)
- L'Her.** Charles Louis de Brutelle L'Heritier (1746–1800)
- Lag. & Rodr.** Mariano Lagasca y Segura (1776–1839) and Jose Demetris Rodriguez (1780–1846)
- Lakela** Olga Korhoven Lakela (b. 1890)
- Lam.** Jean Baptiste Antoine Pierre de Monnet de Lamarck (1744–1829)
- Lam. & DC.** Jean Baptiste Antoine Pierre de Monnet de Lamarck (1744–1829) and Augustin Pyramus de Candolle (1778–1841)
- Lam. & Poir.** Jean Baptiste Antoine Pierre de Monnet de Lamarck (1744–1829) and Jean Louise Marie Poiret (1755–1834)
- Lambert** Aylmer Bourke Lambert (1761–1842)
- Lange** Johan Martin Christian Lange (1818–1898)
- Lapeyr.** Philippe Picot de Lapeyrouse (1744–1818)
- Lauche** Friedrich Wilhelm Georg Lauche (1827–1882)
- Lawson** Charles Lawson (1794–1873)
- Laxmann** Erik G. Laxmann (1737–1796)
- Ledeb.** Carl Friedrich von Ledebour (1785–1851)
- Lehm.** Johann Georg Christian Lehmann (1792–1860)
- Leiberg** John Bernhard Leiberg (1853–1913)
- Lej.** Alexandre Louis Simon Lejeune (1779–1858)
- Lellinger** David Bruce Lellinger (b. 1937)
- Lem.** Charles Antoine Lemaire (1801–1871)
- Lemmon** John Gill Lemmon (1832–1908)
- Lepage** Ernest Lepage (b. 1905)
- Less.** Christian Friedrich Lessing (1809–1862)
- H. Levl.** Augustin Abel Hector Leveille (1863–1918)
- Lewis & Szweykowski** Frank Harlan Lewis (b. 1919) and Jerzy Szweykowski (b. 1925)
- Leysser** Friedrich Wilhelm von Leysser (1731–1815)
- Light.** Lightfoot, John (1735–1788)
- Lilj.** Samuel Liljeblad (1761–1815)
- L. Linden** Lucien Linden (1851–1940)
- Lindl.** John Lindley (1799–1865)
- Lindl. & Gord.** John Lindley (1799–1815) and George Gordon (1806–1879)
- Lindl. & Paxt.** John Lindley (1799–1865) and Joseph Paxton (1803–1865)
- Lindsay** George Edmund Lindsay (b. 1916)
- Link** Johann Heinrich Friedrich Link (1767–1851)
- L. Carl** Linnaeus (1707–1778)
- L. f. Carl** von Linne (fil.) (1741–1783)
- Little** Elbert Luther Little Jr. (b. 1907)
- Litv.** Dmitriy Ivanovitch Litvinov (1854–1929)
- Lodd.** Conrad Loddiges (1738–1826)
- Lois.** Jean Louis August Loiseleur-Deslongchamps (1774–1849)
- Long** Stephen Harriman Long (1784–1864)
- Loudon** John Claudius Loudon (1783–1843)
- Lour.** Joao de Loureiro (1717–1791)
- Love** Askill Love (b. 1916)
- Love & Love** Askill Love (b. 1916) and Doris Benta Maria (nee Wahlen) Love (b. 1918)
- Lund** Peter Wilhelm Lund (1801–1880)
- Lunell** Joel Lunell (1850–1920)
- Ma Yu-Chuan** Ma (b. 1916)
- McArthur** E. Durant McArthur (b. 1941)
- Macbr.** James Francis Macbride (1892–1976)
- Macbr. & Payson** James Francis Macbride (1892–1976) and Edwin Blake Payson (1893–1927)
- Macbryde** Bruce Macbryde (b. 1941)
- McClatchie** Alfred James McClatchie (b. 1906)
- McClelland** John McClelland (1805–1883)
- McClintock & Epling** Elizabeth May McClintock (b. 1912) and Carl Clawson Epling (1894–1968)

- McDermott** Laura Frances McDermott (fl 1908)
Macfady. James Macfadyen (1798–1850)
MacGregor Donald MacGregor (1877–1933)
McGregor Ronald Lighton McGregor (b. 1919)
Mack. Kenneth Kent Mackenzie (1877–1934)
McKelvey Susan Delano McKelvey (b. 1883)
Mack. & Bush Kenneth Kent Mackenzie (1877–1934) and Benjamin Franklin Bush (1858–1937)
Macmillan Conway Macmillan (1867–1929)
McMinn Howard Earnest McMinn (1891–1963)
Macoun John Macoun (1831–1920)
McVaugh Rogers McVaugh (b. 1909)
Maguire Bassett Maguire (b. 1904)
Maguire & Cronq. Bassett Maguire (b. 1904) and Arthur John Cronquist (b. 1919)
Maguire & Holmgren Bassett Maguire (b. 1904) and Arthur Herman Holmgren (b. 1912)
Maguire & Woodson Bassett Maguire (b. 1904) and Robert Everard Woodson (1904–1963)
Maire Rene Charles Joseph Ernest Maire (1878–1949)
Makino Tomitaro Makino (1862–1957)
Malte Oscar Malte (1880–1933)
Manetti Guiseppe Manetti (1831–1858)
Mansfeld Rudolf Mansfeld (1901–1960)
Marcy Randolph Barnes Marcy (1812–1887)
Marshall Humphry Marshall (1722–1801)
W. T. Marshall William Taylor Marshall (1886–1957)
J. Martin James Stillman Martin (b. 1914)
Martin Robert F. Martin (b. 1910)
Martius Carl Friedrich Philipp von Martius (1794–1868)
Mason Herbert Louis Mason (b. 1896)
Mathias Mildred Esther Mathias (b. 1906)
Math. & Const. Mildred Esther Mathias (b. 1906) and Lincoln Constance (b. 1909)
Mattf. Johannes Mattfeld (1895–1951)
Maxim. Carl Johann Maximowicz (1827–1891)
Maxon William Ralph Maxon (1877–1948)
Mayr Heinrich Mayr (1856–1911)
Medicus Friedrich Casimir Medicus (Medikus) (1736–1808)
L. Medicus Ludwig Wallrad Medicus (1771–1850)
Meissner Carl Daniel Friedrich Meissner (1800–1874)
Meld. Alexander Melders (b. 1909)
Merriam Clinton Hart Merriam (1855–1942)
Merr. Elmer Drew Merrill (1876–1956)
Mett. Georg Heinrich Mettenius (1823–1866)
Mey. & Scherb. Bernhard Meyer (1767–1836) and Johannes Scherbis (1769–1813)
C. A. Mey. Carl Anton Andreevic von Meyer (1795–1855)
E. Mey. Ernst Heinrich Friedrich Meyer (1791–1858)
F. C. Meyer Frederic Gustav Meyer (b. 1917)
Mez Carl Christian Mez (1866–1944)
Michx. Andre Michaux (1746–1802)
Michx. f. Francois Andre Michaux (fil.) (1770–1855)
Miers John Miers (1789–1879)
Miki Sigeru Miki (1901–1974)
Milde Carl August Julius Milde (1824–1871)
Miller Phillip Miller (1691–1771)
G. N. Miller G. N. Miller
Milliken Jessie Milliken (b. 1887)
Millsp. Charles Frederick Millspaugh (1854–1923)
Miq. Friedrich Anton Wilhelm Miquel (1811–1871)
Mirbel Charles Francois Brisseau de Mirbel (1776–1854)
Mitchell John Mitchell (1676–1768)

Rose & Painter Joseph Nelson Rose (1862–1928) and Joseph Hannum Painter (1879–1908)
Rosend. Carl Otto Rosendal (1875–1956)

- Rosend., **Butters**, & **Lakela** Carl Otto Rosendal (1875–1956), Frederic King Butters (1878–1945) and Olga Korhonen Lakela (b. 1890)
- Rostkov Friedrich Wilhelm Gotlieb Rostkov (1770–1848)
- Roth Albrecht Wilhelm Roth (1757–1834)
- Rothm. Werner Hugo Paul Rothmaler (1908–1962)
- Rothr. Joseph Trimble Rothrock (1839–1922)
- Rottb. Christen Friis Rottboell (1727–1797)
- Rousseau Jean-Jacques Rousseau (1712–1778)
- Rouy Georges C. Chr. Rouy (1851–1924)
- Rowley Gordon D. Rowley (b. 1921)
- Roxb. William Roxburgh (1751–1815)
- Royle John Forbes Royle (1779–1858)
- Rudd Velva E. Rudd (b. 1910)
- Rudolphi Karl Asmund Rudolphi (1771–1832)
- Ruiz & Pavon Hipolito Ruiz (1754–1815) and Jose Antonio Pavon (1750–1844)
- Rumpler Theodor Rumpler (1817–1891)
- Runem. Hans Runemark (b. 1927)
- Rupr. Franz Josef Ruprecht (1814–1870)
- Rydb. Per Axel Rydberg (1860–1931)
- St. John Harold St. John (b. 1892)
- J. St. Hil. Jean Henri Jaume Saint-Hilaire (1840–1912)
- St.-Yves Alfred Saint-Yves (1855–1933)
- Salisb. Richard Anthony Salisbury (1761–1829)
- Sarg. Charles Sprague Sargent (1841–1927)
- Sarnth. Ludwig von Sarnthein (1861–1914)
- Sauer Jonathan Sauer (b. 1918)
- Savi C. Gaetano Savi (1769–1844)
- Schaffner Wilhelm Schaffner (1830–1882)
- J. H. Schaffn. John Henry Schaffner (1866–1939)
- Schauer Johann Conrad Schauer (1813–1848)
- Scheele George Heinrich Adolf Scheele (1808–1864)
- Scheutz Nils Johan Wilhelm Scheutz (1836–1889)
- Schinz & R. Keller Hans Schinz (1858–1941) and Robert Keller (1854–1939)
- Schinz & Thell. Hans Schinz (1858–1941) and Albert Thellung (1881–1928)
- Schischkin Boris Konstantinovich Schischkin (1886–1963)
- Schkuhr Christian Schkuhr (1741–1811)
- Schlecht. Diederich Franz Leonhard von Schlechtendal (1794–1866)
- Schleicher Johann Christoph Schleicher (1768–1834)
- Schleiden Matthias Jacob Schleiden (1804–1881)
- Schmidt Franz Schmidt (1751–1834)
- F. W. Schmidt Franz Wilibald Schmidt (1764–1796)
- Schmidel Casimir Christoph Schmidel (1718–1792)
- Schneider Camillo Karl Schneider (1876–1951)
- Schnitzl. Adalbert Carl Friedrich Schnitzlein (1814–1865)
- Schoener Carol Susan Schoener (b. 1946)
- Schott Heinrich Wilhelm Schott (1794–1865)
- Schrader Heinrich Adolph Schrader (1767–1836)
- Schrank Franz von Paula von Schrank (1747–1835)
- Schreber Johann Christian Daniel von Schreber (1739–1810)
- B. Schreiber Beryl Olive Schreiber (b. 1911)
- Schrenk Alexander Gustav von Schrenk (1816–1876)
- Schultes Josef August Schultes (1773–1831)
- Schult. & Schult. Josef August Schultes (1773–1831) and Julius Hermann Schultes (1804–1840)
- Schultz-Bip. Carl Heinrich Schultz-Bipontinus (1805–1867)
- Schultz-Schultzens. Karl Heinrich Schultz-Schultzenstein (1798–1881)
- Schulz Otto Eugen Schulz (1874–1936)
- K. Schum. Karl Moritz Schumann (1851–1904)
- Schur Philipp Johann Ferdinand Schur (1799–1878)
- Schweigger August Friedrich Schweigger (1783–1821)
- Schweigg. & Koerte August Friedrich Schweigger (1783–1821) and Franz Koerte (1782–1845)
- Schwein. Ludwig David von Schweinitz (1780–1834)
- Scop. Giovanni Antonio Scopoli (1723–1788)
- Scribn. Frank Lamson Scribner (1851–1938)
- Scribn. & Merr. Frank Lamson Scribner (1851–1938) and Elmer Drew Merrill (1876–1956)
- Scribn. & Sm. Frank Lamson Scribner (1851–1938) and Jared Gage Smith (1866–1925)
- Scribn. & Will. Frank Lamson Scribner (1851–1938) and Thomas Albert Williams (1865–1900)
- Seemann Berthold Carl Seeman (1825–1871)
- Selander Nils Sten Edward Selander (1891–1957)
- Sellow Friedrich Sellow (1789–1831)
- Sendt. Otto Sendtner (1813–1859)
- Sennen & Pau Frere E. C. Sennen (1861–1937) and Carlos Pau y Espanol (1857–1937)
- Ser. Nicolas Charles Seringe (1776–1858)
- Seub. Moritz August Seubert (1818–1878)
- W. Sharp Ward McClintic Sharp (b. 1904)
- E. Shaw Elizabeth A. Shaw (b. 1938)
- Shear Cornelius Lott Shear (1865–1956)
- Sheldon Edmund Perry Sheldon (b. 1869)
- Sherff Earl Edward Sherff (1886–1966)
- Shev. Charles J. Sheviak
- Shinn. Lloyd Herbert Shinn (1918–1971)
- L. Shultz Leila M. Shultz (b. 1946)
- J. Shultz John Shultz (b. 1943)
- Sibth. John Sibthorp (1758–1796)
- Sieb. & Zucc. Philipp Franz Siebold (1796–1866) and Joseph Gerhard Zuccarini (1797–1848)
- Silliman Benjamin Silliman (1779–1864)
- Silva Tarouca Ernst (Graf) Silva Tarouca (1860–1936)
- Silveus William Arento Silvens (b. 1875)
- Sitgr. Lorenzo Sitgreaves (d. 1888)
- Slosson Margaret Slosson (b. 1872)
- Small John Kunkel Small (1869–1938)
- Small & Cronq. John Kunkel Small (1869–1938) and Arthur John Cronquist (b. 1919)
- Smiley Frank Jason Smiley (b. 1880)
- C. P. Sm. Charles Piper Smith (1877–1955)
- F. G. Sm. Frank G. Smith
- J. E. Sm. James Edward Smith (1759–1828)
- J. G. Sm. Jared Gage Smith (1866–1925)
- Smyth Bernard Bryan Smyth (1843–1913)
- Snowden Joseph Davenport Snowden (1886–1973)
- Sobol. Gregorius Fedorovitch Sobolevski (1741–1807)
- Sol. Daniel Carl Solander (1733–1782)
- Solbrig Otto Thomas Solbrig (b. 1930)
- Soul.-Bod. Etienne Soulange-Bodin (1774–1846)
- Spach Edouard Spach (1801–1879)
- Spegaz. Carlo Luigi Spegazzini (1858–1926)
- Sprengel Kurt Polycarp Joachim Sprengel (1766–1833)
- Stacey John William Stacey (1871–1943)
- Standley Paul Carpenter Standley (1884–1963)
- Stansb. Howard Stansbury (1806–1863)
- Stapf Otto Stapf (1857–1933)
- Staudt Gunther Staudt (publ. 1961)
- Stebbins George Ledyard Stebbins (b. 1906)
- Sternb. Caspar Maria (Graf) von Sternberg (1761–1838)

- Stuedel** Ernst Gottlieb von Stuedel (1783–1856)
Steven Christian von Steven (1781–1863)
Stewart M. G. Stewart (publ. 1934)
Steyerm. Julien Alfred Steyermark (b. 1909)
Stockhouse Stockhouse, W. (fl. 1984)
Stockwell William Palmer Stockwell (1898–1950)
Stokes Susan Gabriella Stokes (1868–1954)
Strother John Lance Strother (b. 1941)
Stuckey Ronald Lewis Stuckey (b. 1938)
Sturm Jakob W. Sturm (1771–1848)
Stutz Howard Stutz (b. 1918)
Sudw. George Bishop Sudworth (1864–1927)
Suksd. Wilhelm Nikolaus Suksdorf (1850–1932)
Svenson Henry Knute Svenson (b. 1897)
Swallen Jason Richard Swallen (b. 1903)
Swartz Olof Peter Swartz (1760–1818)
Sweet Robert Sweet (1783–1835)
Swezey Godwin Deloss Swezey (1851–1934)
Sydow Hans Sydow (1879–1946)
Syme John Thomas Irvine Boswell Syme (1822–1888)
Tateoka Tuguo Tateoka (b. 1931)
Taub. Paul Hermann Wilhelm Taubert (1862–1897)
Tausch Ignaz Friedrich Tausch (1793–1848)
Taylor Thomas Taylor (1775–1848)
Ten. Michele Tenore (1780–1861)
Thell. Albert Thellung (1881–1928)
Theobald William Louis Theobald (b. 1936)
Theobald & Tseng William Louis Theobald (b. 1936) and Chiao C. Tseng (publ. 1964)
Thieb. Arsenne Thiebaud de Berneaud (1777–1850)
H. J. Thompson Henry Joseph Thompson (b. 1921)
Thompson & Roberts Henry Joseph Thompson (b. 1921) and Roberts
Thompson Zadock Thompson (1796–1856)
Thornber John James Thornber (1872–1962)
Thorne Robert Folger Thorne (b. 1920)
K. Thorne Kaye (nee Hugie) Thorne (b. 1939)
Thuill. Jean Louis Thuillier (1757–1822)
Thunb. Carl Peter Thunberg (1743–1828)
Thurber George Thurber (1821–1890)
Tidestr. Ivar Frederick Tidestrom (1864–1956)
Tidestr. & Kittell Ivar Frederick Tidestrom (1864–1956) and Sister Marie Teresa Kittell (b. 1892)
Timm Joachim Christian Timm (1734–1805)
Toft & Welsh Catherine Ann Toft (b. 1950) and Stanley Larson Welsh (b. 1928)
Tomb Andrew Spencer Tomb (b. 1943)
Torr. John Torrey (1796–1873)
Torr. & Frem. John Torrey (1796–1873) and John Charles Fremont (1813–1890)
T. & G. John Torrey (1796–1873) and Asa Gray (1810–1888)
Torr. & Hook. John Torrey (1796–1873) and William James Hooker (1785–1865)
Trautv. Ernst Rudolf von Trautvetter (1809–1889)
Trel. William Trelease (1857–1945)
Trev. Ludolf Christian Treviranus (1779–1864)
Trew Christoph Jakob Trew (1695–1769)
Trin. Carl Bernhard von Trinius (1778–1844)
Trin. & Rupr. Carl Bernhard von Trinius (1778–1844) and Franz Josef Ruprecht (1814–1870)
Tuckerman Edward Tuckerman (1817–1886)
Tuckey James Kingston Tuckey (1776–1816)
Tul. Edmond Louis Rene Tulasne (1815–1885)
Turcz. Porphir Kiril Nicolas Stepanovich Turczaninow (1796–1864)
Turner Billie Lee Turner (b. 1925)
Turra Antonio Turra (1730–1796)
Tutin Thomas Gaskell Tutin (b. 1908)
Underw. Lucien Marcus Underwood (1853–1907)
Urban Ignatz Urban (1848–1931)
Urv. Jules Sebastian Cesar Dumont d'Urville (1790–1842)
Vahl Martin Hendriksen Vahl (1749–1804)
Vail Anna Murray Vail (b. 1863)
Van Houtte Louis Van Houtte (1810–1876)
L. Van Houtte Louis Benoit Van Houtte (1898–1952)
Vasey George Vasey (1822–1893)
Vasey & Scribn. George Vasey (1822–1893) and Frank Lamson Scribner (1851–1938)

 Wulfen Franz Xavier Wulfen (1728–1805)
 Yates Harris Oliver Yates (b. 1934)
 York Harlan Harvey York (b. 1875)
 A. Young Alven Young (1903–1965)
 Yuncker Truman George Yuncker (1895–1964)
 Zabel Hermann Zabel (1932–1912)
 Zam. Aleksander Zamels (1897–1943)
 Zenker Jonathan Carl Zenker (1799–1837)
 Zucc. Joseph Gerhard Zuccarini (1797–1848)

GLOSSARY

- A-** (prefix). Meaning without, lacking, as in *acaulescent*.
Abaxial. On the side away from the axis.
Aberrant. Atypical, different from the usual.
Abortive. Not developing; rudimentary; barren.
Abrupt. Terminating suddenly.
Abscission. Falling away due to breakdown of thin-walled
 cells at the base of a structure, as of a leaf or petiole.
Acaulescent. Without a stem, the leaves all basal.
Accessory fruit. Fruit with a large and succulent recepta-
 cle, as in the strawberry.
Accrescent. Enlarging with age, as with the calyx in many
 flowers.
Accumbent. Lying against, as in the cotyledons against
 the radicle.
Acerose. Needle-shaped, like pine leaves.
Achene. A small dry, hard, 1-loculed, 1-seeded indehis-
 cent fruit.
Acicular. Needle-shaped.
Acorn. The leathery fruit of an oak, containing a single
 large seed and enclosed basally in a cup formed from
 bract.
Acrid. Sharp or bitter tasting, as with the sap of many
 plants.
Actinomorphic. Radially symmetric, as in a regular
 flower.
Aculeate. Armed with prickles, as with the stem of a rose;
 sharply pointed.
Acumen. Apex.
Acuminate. Gradually tapering to a point, the sides some-
 what concave.
Acute. Sharp; tapering to the apex with straight sides.
Ad-. Latin prefix, meaning to or toward.
Adaxial. Located on the side nearest the axis.
Adherent. Sticking together.
Adnate. Union of 2 unlike parts, as with stamens attached
 to the petals, or sepals to petals.
Adventitious. Organs developing in an unusual position,
 as with roots developing from stems or leaves.
Adventive. Applied to an introduced plant that has spread
 or is spreading into a new locality or region.
Agamospermy. Lacking sexual union; an embryo devel-
 oping from the innermost layer of the nucellus.
Aggregate fruit. Fruit having several separate pistils of a
 single flower attached to a common receptacle, as in the
 raspberry.
Alkaline. Of or pertaining to, or having the properties of
 alkali; basic, having a pH greater than 7.0.
Allopatric. Occupying different geographical areas.
Alluvial. Pertaining to or composed of alluvium as sand,
 gravel, or similar detrital material deposited by run-
 ning water or wind.
Alpine. Applying to plants growing at or above timber line.
Alternate. Borne between, not in front of, as with sta-
 mens when between the petals.
Alveolate. Honeycombed, with pits in the surface as in
 some seeds and receptacles.

- Ament.** Catkin; a usually deciduous dense spike or raceme with bracteate apetalous unisexual flowers, as in Salicaceae.
- Amplexicaul.** Clasping the stem, as a leaf base or stipule.
- Ampliate.** Enlarged.
- Androecium.** Collectively, the entire set of stamens in a flower.
- Androgynous.** With staminate flowers borne above the pistillate ones, as in many species of *Carex*.
- Angiosperm.** A group of flowering plants with the ovules enclosed in an ovary.
- Annual.** Plants growing from seed and producing flowers and seeds and dying the same year.
- Annular.** In the form of a ring.
- Annulus.** In ferns, the organ along the side of a sporangium, which functions in bursting the sporangium at maturity.
- Anterior.** Front; on the front side; the side away from the axis.
- Anther.** The pollen-bearing part of the stamen.
- Antheridium.** Sperm producing structure in the gametophyte generation, as in ferns.
- Antheriferous.** Anther-bearing.
- Anthesis.** Flowering; the period when the flower is completely expanded and typically functional.
- Anthocyanic.** Containing anthocyanins—blue, purple, or red pigments.
- Antrorse.** Directed forward or upward, opposite of retrorse.
- Apetalous.** Without petals.
- Aphyllous.** Leafless.
- Apical.** Located at the tip.
- Apiculate.** Ending in an abrupt slender tip.
- Apiculus.** A small sharp point.
- Apomictic.** Producing seeds without any form of sexual union or fertilization.
- Apospory.** Production of gametophytes directly from somatic cells.
- Appendage.** A secondary attached part.
- Appressed.** Lying close and flat against another part.
- Approximate.** Close together but not united.
- Aquatic.** Living in water.
- Arachnoid.** With cobwebby or entangled, very fine hairs.
- Arborescent.** Treelike.
- Arcuate.** Arching or curved like a bow.
- Areola** (pl. areolae). A small space on or beneath the surface, as the area between the small veins; in cacti, the structure which bears flowers, spines, or glochids, or all three.
- Argillaceous.** Clayey; growing in clay; clay colored.
- Aril.** An appendage growing at or above the hilum of a seed.
- Aristate.** With an awn or stiff bristle.
- Armature** (armed). Spines, barbs, prickles, or thorns (or bearing these).
- Articulate.** Jointed, and separating at maturity with a clean scar.
- Ascending.** Growing obliquely upward, often curving.
- Asexual.** Sexless; reproducing vegetatively.
- Atropurpurea.** Dark purple; blackish purple.
- Attenuate.** Gradually narrowing to a tip or base.
- Auricle.** An ear-shaped appendage.
- Auriculate.** With one or more auricles.
- Awl-shaped.** Narrowly triangular, short, sharp-pointed like an awl.
- Awn.** A bristle like appendage, as on the tips of glumes and lemmas of many grasses.
- Axil.** The upper (ventral) angle between a leaf and a stem.
- Axile.** Belonging to or situated in the axis, as with a placenta situated in the axis of a pistil.
- Axillary.** Located in or arising in an axil.
- Axis.** The longitudinal central line around which organs are borne, as with the stem supporting the inflorescence.
- Banner.** Upper petal of a papilionaceous flower, as in the sweet pea.
- Barbate.** Bearded with long stiff hairs; diminutive of barbed.
- Barbed.** Bearing sharp, rigid, reflexed points like the barb of a fishhook.
- Barbellate.** With short, usually stiff hairs.
- Bark.** Outer layer of a woody stem, usually including all tissues external to the cambium.
- Basal.** Related to or located at the base.
- Basifixed.** Attached by the base, as an anther attached by its base to the filament.
- Basionym.** The name on which a binomial (plant name) or other taxonomic category is based.
- Beak.** A prolonged, usually narrowed tip of a thicker organ, as in some fruits and petals.
- Beaked.** Bearing a beak.
- Bearded.** Bearing long hairs, usually in tufts.
- Berry.** A pulpy indehiscent fruit, usually with several to many seeds (no stone), as the tomato.
- Bi-.** Latin prefix signifying two, twice, or doubly, as in bidentate (two-toothed).
- Bidentate.** Having two teeth.
- Biennial.** Plants living two years, usually flowering and fruiting the second year (i.e., germinating one spring and producing a rosette that overwinters prior to bolting, flowering, and fruiting in the spring of the second year, thereafter dying).
- Bifid.** Two-cleft to about the middle.
- Bifurcate.** Forked, as in Y-shaped hairs.
- Bilabiate.** With two lips, as in many irregular sym-petalous flowers.
- Bilocular.** With two locules, as an ovary.
- Binate.** In pairs.
- Binomial.** The names of the genus and species taken collectively, e.g. *Astragalus utahensis*.
- Bipinnate.** Doubly or 2-pinnate, as in many compound leaves.
- Bipinnatifid.** Twice pinnately cleft.
- Bisected.** Completely divided into two parts.
- Biseriate.** In two rows or series, one above the other, as in the seeds of some mustards.
- Bladdery.** Thin and inflated.
- Blade.** The expanded part of a leaf or petal.
- Brackish.** Somewhat saline.
- Bract.** A reduced leaf subtending a flower, usually associated with the inflorescence.
- Bracteate.** With bracts.
- Bracteolate.** Provided with bracteoles, as at the base of a flower near the apex of a pedicel.
- Bracteole.** A small bract, especially on a floral axis; also called bractlet.
- Bractlet.** See bracteole.
- Bridge.** The band of tissue connecting adjacent corolla scales in *Cuscuta*.
- Bristly.** Bearing stiff hairs.

- Bud.** An undeveloped leaf or flower shoot, often enclosed by specialized leaves called bud-scales.
- Bulb.** An underground leaf bud with thickened scales, as in the onion.
- Bulblet.** A small bulb, usually axillary and above ground.
- Bulbose.** Bulblike.
- Bur.** A structure or part armed with spines or appendages, typically dispersed by animals.
- Caducous.** Falling off very early or prematurely.
- Caespitose** (also *cespitose*). Growing in tufts.
- Callosity.** A hardened thickening.
- Callus.** The thickened extension at the base of the lemma in some grasses.
- Calyptra.** A lid or hood.
- Calyx.** Outer whorl of flowering parts; collective term for all the sepals of a flower.
- Calyx lobe.** In a gamosepalous calyx, one of the free parts.
- Calyx tube.** The tube of a gamosepalous calyx.
- Cambium.** A tissue composed of actively or potentially actively dividing cells, typically situated between the xylem and phloem.
- Campanulate.** Bell-shaped.
- Canescent.** Covered with gray white or hoary, fine hairs.
- Capillary.** Hairlike, very fine and slender.
- Capitate.** Head-shaped, or in a head, as the stigma of many flowers or the inflorescence of many Compositae.
- Capsule.** A dry fruit of more than 1 carpel that opens to release the seeds.
- Carinate.** Keeled, with a sharp longitudinal ridge.
- Carpel.** A simple pistil, or 1 of the modified leaves forming a compound pistil; a megasporophyll.
- Carpophore.** That part of the receptacle prolonged between the carpels.
- Cartilaginous.** Like cartilage, tough and firm.
- Caruncle.** A protuberance or outgrowth near the hilum of a seed.
- Caruncular.** Of or pertaining to a caruncle.
- Caryopsis.** The grain or fruit of grasses.
- Catkin.** A deciduous dense spike or raceme with bracteate, apetalous unisexual flowers as in Salicaceae; ament.
- Caudate.** Bearing a tail or a slender taillike appendage.
- Caudex.** The woody base of an otherwise herbaceous perennial.
- Caulescent.** With a definite leafy stem.
- Cauline.** Belonging to or on the stem.
- Cell.** A cavity of an anther containing the pollen, or of an ovary with ovules; a locule.
- Ceraceous.** Waxy in appearance or color.
- Cernuous.** Nodding, pendulous, drooping.
- Cespitose.** See *caespitose*.
- Chaff.** Thin dry scales, especially the bracts on the receptacle of heads in composites.
- Channeled.** Deeply grooved longitudinally.
- Chaparral.** An evergreen vegetation type with a dense growth of leathery leaved shrubs.
- Chartaceous.** With the texture of paper, usually not green.
- Chasmogamous.** Said of open, cross-pollinated flowers.
- Ciliate.** Fringed with marginal hairs.
- Cilium** (pl. *cilia*). A slender, hairlike process.
- Cinereous.** Ash colored; light gray.
- Circinate.** Coiled from the top downward with the apex as the center, as in the developing leaves of ferns.
- Circumboreal.** Occuring around the earth in the northern part of the northern hemisphere south of the circumpolar region.
- Circumpolar.** Occurring all the way around the pole, usually meant to be the north pole as with many arctic plants.
- Circumscissile.** Dehiscing by a transverse line around the fruit or anther, the top falling as a lid.
- Cladophyll.** A flattened leaflike stem, functioning as a leaf.
- Clasping.** Leaf partly or wholly surrounding the stem.
- Clavate.** Club-shaped, gradually thickened toward the tip.
- Claw.** A narrowed base of the petal in some flowers.
- Cleft.** Split nearly to the middle.
- Cleistogamous.** Flowers self-fertilizing without opening, as in the violet.
- Clone.** Vegetatively produced individuals from a common parent.
- Coalescent.** Grown together to form a single unit.
- Coetaneous.** With the flowers developing the same time as the leaves.
- Coherent.** Two or more similar organs or parts touching and adhering but usually not joined by fusion of tissues.
- Collar.** The area on the outside of a grass leaf at the junction of the blade and the sheath.
- Colonial.** In colonies; usually a reference to plants occurring in clumps in which the individuals are connected by rhizomes or other underground organs.
- Column.** Body formed by the union of stamens and pistils, as in orchids, mallows and milkweeds.
- Coma.** A tuft of hairs, as in the seeds of milkweeds.
- Commissure.** The face by which two carpels cohere, as in the Umbelliferae.
- Comose.** Bearing a tuft of hairs.
- Complete.** Having all the parts belonging to it, as a flower with sepals, petals, stamens, and pistil(s).
- Compliate.** Folded together.
- Compound.** Having two or more similar parts in one organ.
- Compound leaf.** A leaf with two or more leaflets.
- Compressed.** Flattened.
- Concave.** Hollowed out.
- Conduplicate.** Folded together lengthwise, as the leaves of many grasses.
- Conspecific.** Of the same species.
- Cone.** A strobilus, the fertile aggregation of microsporophylls or megasporophylls and associated axis and bracts, as in *Pinus*.
- Coniferous.** Bearing cones or strobili.
- Confluent.** Blending of one part into another.
- Congested.** Crowded together.
- Conglomerate.** Densely clustered.
- Conic.** Cone-shaped, with the point of attachment at the broad base.
- Connate.** The union of like structures.
- Connective.** Portion of the filament connecting the two cells of an anther.
- Connivent.** Converging but not united.
- Consimilar.** Like one another.
- Constricted.** Drawn in, narrowed and then expanded.
- Contorted.** Twisted or bent.
- Contracted.** Narrowed in a particular place.
- Convex.** Rounded on the surface.
- Convolute.** Rolled up longitudinally.

- Copious.** Abundant, plentiful.
- Coralloid.** Corallike.
- Cordate.** Heart-shaped.
- Coriaceous.** Leathery.
- Corm.** A short, bulblike, underground stem, with only papery scale leaves.
- Corolla.** Inner whorl of floral parts; collective name for petals.
- Corona.** A crown; the whorl of structures between petals and stamens; cuplike in *Narcissus* or of separate parts as in *Asclepias*.
- Corrugated.** Strongly and usually regularly wrinkled or folded.
- Cortex.** Rind or bark; parenchymatous tissue between epidermis and pericycle.
- Corymb.** A flat-topped or convex racemose flower cluster, the lower or outer pedicels longer, their flowers opening first.
- Corymbose.** Arranged in corymbs.
- Costa (pl. costae).** A rib, as in a thickened midvein (costate—ribbed).
- Cotyledon.** The primary leaf or leaves of the embryo.
- Creeping.** Growing along the ground or just under the surface and producing roots at the nodes.
- Crenate.** Having the margins with rounded teeth.
- Crenulate.** Crenate, but the teeth themselves small.
- Crested.** With a ridge or elevated rib on the summit or back.
- Creosote.** A colorless, oily, aromatic liquid, as in reference to *Larrea tridentata*, an odoriferous shrub.
- Crisped.** Curled; wavy.
- Cristate.** Crested or with a terminal tuft.
- Crown.** The persistent base of a herbaceous perennial; the top of a tree; a corona.
- Cruciform.** Cross-shaped.
- Crustaceous.** Of brittle texture when dry, as in the leaf margin of some plants.
- Cucullate.** Hood-shaped.
- Cucullus.** A partial to complete seed covering external to the seed coat in *Nemophila*.
- Culm.** The type of hollow or pithy slender stem found in grasses.
- Cultivar.** A race or variety originating under cultivation.
- Cuneate.** Wedge-shaped, triangular, with the narrow part at point of attachment.
- Cupulate.** Furnished with or subtended by a small cup.
- Cuspidate.** Tipped with a cusp or a sharp, short, rigid point.
- Cyathium.** The inflorescence of *Euphorbia*, consisting of a 3-lobed ovary and a cuplike involucre bearing male flowers with solitary stamens.
- Cylindric.** Elongate and circular in cross section.
- Cymbiform.** Boat-shaped.
- Cyme.** A flat-topped or convex paniculate flower cluster, with the central flowers opening first.
- Cymose.** With the flowers in a cyme.
- Cymule.** A small cyme.
- Deciduous.** Falling off; not evergreen.
- Declined.** Curved downward.
- Decomposed.** More than once divided or compounded.
- Decumbent.** Resting on the ground, but with tip of the stem ascending.
- Decurrent.** Extending down the stem below the insertion, as with leaves or stipules.
- Decussate.** Opposite pairs, usually applied to leaves, alternating at right angles with those above and below.
- Deflexed.** Turned abruptly downward.
- Dehiscent.** Opening spontaneously when ripe to discharge the contents, as an anther or fruit.
- Deltoid.** Equilaterally triangular; shaped like the Greek letter delta.
- Dendritic.** Branched like a tree, as some hairs in the Cruciferae.
- Dentate.** Having the margins cut with sharp teeth that are not directed forward.
- Denticulate.** Minutely dentate or toothed.
- Depauperate.** Small or poorly developed, usually due to environmental conditions.
- Depressed.** Low and flattened from above.
- Determinate.** Said of an inflorescence in which the terminal (central) flower opens first.
- Diadelphous.** Stamens united by their filaments into two sets.
- Diaphanous.** Transparent.
- Dichotomous.** Repeatedly forked in pairs.
- Dicotyledon.** Plant group with two seed leaves; the Magnoliopsida.
- Didymous.** Twin; found in pairs, as the fruit halves in the genus *Physaria*.
- Didynamous.** Having 4 stamens disposed in pairs, 2 long and 2 short, as in many Labiatae.
- Diffuse.** Widely and diffusely spreading.
- Digitate.** Fingered; shaped like an open hand; palmate.
- Dilated.** Flattened and broadened, as an expanded filament.
- Dimorphic.** Having two forms.
- Diocious.** Having staminate and pistillate flowers on different plants.
- Diploid.** Having two complete sets of chromosomes in each cell.
- Disarticulating.** Separating joint from joint at maturity, as leaves at the petiole base.
- Discoid.** Disklike; having disk flowers.
- Disk.** A fleshy development of the receptacle about the base of an ovary; in Compositae the tubular flowers of the head as distinct from the ray; also spelled disc.
- Dissected.** Deeply divided into numerous fine segments.
- Distal.** Opposite the point of attachment; apical; away from the axis.
- Distichous.** In 2 vertical rows or ranks.
- Distinct.** Separate; not united with parts in the same whorl.
- Diurnal.** Opening during the day.
- Divaricate.** Widely divergent.
- Divergent.** Spreading.
- Divided.** Separated to the base.
- Dolabriform.** Pick-shaped as in two-armed hairs attached at or near the middle and tapering to the ends.
- Dorsal.** Pertaining to the back; the surface turned away from the axis; abaxial.
- Dorsifixed.** Attached to the back.
- Dorsiventral.** Having an upper and lower surface.
- Double.** Said of flowers when floral parts are more numerous than usual.
- Drupping.** Erect at the base but bending downward above.
- Drupe.** Fleshy fruit in which the inner layer of the ovary wall becomes hard, as in the peach.
- Drupelet.** One fruit of an aggregation of such fruits (aggregate fruit), as in a raspberry.
- E-, Ex-.** Latin prefix, meaning without, out of or from.

- Ebracteate.** Without bracts.
- Echinate.** With stout bluntish prickles.
- Ecotone.** The area of intergradation between vegetative types.
- Ecotype.** Those individuals adapted to one kind of environmental condition.
- Edaphic.** Pertaining to, or influenced by, soil conditions.
- Ellipsoid.** An elliptic solid.
- Elliptic.** In the form of a flattened circle, more than twice as long as broad, widest in the center and the two ends equal.
- Emarginate.** With a small notch at the apex.
- Emersed.** Raised above the water; emergent.
- Enation.** An outgrowth on the surface of an organ.
- Endemic.** Restricted to a geographic region, topographic unit, or edaphic situation.
- Endocarp.** The inner layer of the pericarp.
- Endosperm.** The food storage tissue surrounding the embryo of a seed and formed in the embryo sac, resulting from fertilization of the polar nuclei by a sperm (typically 3n or 5n).
- Enfold.** To fold inward or toward one another.
- Ensiform.** Sword-shaped, as the leaves of an *Iris*.
- Entire.** Undivided; the margin continuous, not incised or toothed.
- Ephemeral.** Lasting for short time.
- Epidermis.** The cellular covering layer of an organ, as a leaf, stem, or root.
- Epigynous.** Attached at the top of the ovary or apparently so.
- Epithet.** A name given to a plant, e. g., *utahensis* in *Astragalus utahensis*.
- Equitant.** Overlapping in 2 ranks; as the leaves of an *Iris*.
- Erect.** Upright in relation to the ground, or sometimes perpendicular to the surface of attachment.
- Erose.** Irregularly toothed as if gnawed.
- Estipulate.** Without stipules (also exstipulate).
- Etiolated.** White through failure to develop chlorophyll and usually elongate and spindly.
- Evanescent.** Soon disappearing; lasting only a short time.
- Even pinnate.** A compound leaf lacking a terminal leaflet.
- Evergreen.** Remaining green over winter; not deciduous altogether.
- Excurrent.** Extending beyond the margin, as in a leaf base extending down the stem.
- Exfoliate.** To come off in scales or flakes, as the bark of some trees.
- Exocarp.** The outer layer of the pericarp.
- Explanate.** Spread out flat.
- Exserted.** Protruding, as stamens projecting from the corolla; not included.
- Extrorse.** Facing inward; said of anther dehiscence.
- Exudate.** Anything excreted, often forming a deposit on the surface of plant part.
- Falcate.** Sickle-shaped.
- Falls.** Outer whorl of perianth parts in an *Iris*; the sepals.
- Farinaceous.** Having a mealy texture or surface.
- Farinose.** Covered with meal-like particles as in some taxa of *Chenopodium*.
- Fasciated.** Much flattened or convoluted due to a teralogical widening of its stem, as in cacti.
- Fascicle.** A close cluster or bundle of flowers, leaves, stems, or roots.
- Fasciculate.** Connected or drawn into a bundle.
- Fastigiata.** Clustered, parallel, erect branches.
- Faveolate (alveolate).** Honeycombed, as with the surface of some *Phacelia* seeds and the receptacle of many Compositae.
- Fenestrate.** Perforated with openings or translucent areas, as in schizocarps of Malvaceae.
- Fertile.** Said of pollen-bearing stamens and seed-bearing fruits.
- Festucoid.** Like a *Festuca*; a plant belonging to the grass group Festucoidea.
- Fetid.** Having a disagreeable odor.
- Fibrillose.** With or bearing fibers.
- Filament.** A thread, especially the stalk of an anther.
- Filiform.** Threadlike.
- Fimbriate.** Fringed.
- Fistulose.** Hollow, often rather enlarged.
- Flabellate.** Fanlike.
- Flaccid.** Weak, limp or flabby.
- Fleshy.** Thick and juicy; succulent.
- Flexuose.** Zigzag.
- Floccose.** Bearing tufts of soft woolly hair.
- Floral tube.** A somewhat elongate tube of the perianth or other floral parts.
- Floret.** Lemma and palea of the small included flower of a grass; also the small flower of the Compositae.
- Floriferous.** Bearing or producing many flowers.
- Flower.** A fertile branch, typically consisting of four whorls, i. e. sepals, petals, stamens, and pistils, but one or more of the whorls often lacking.
- Foliaceous.** Leaflike.
- Foliolate.** Having leaflets.
- Foliose.** Closely clothed with leaves; leaflike.
- Follicle.** A dry, dehiscent fruit, consisting of a single carpel which opens only on the ventral suture, as in the milkweed.
- Forma.** The ultimate category in plant classification, typically based on minor morphological differences; abbreviation = f.
- Fornices.** A set of small appendages in the throat of the corolla in the Boraginaceae.
- Fornix.** One of a set of small appendages in the corolla throat in the Boraginaceae.
- Foveate.** Pitted.
- Foveolate.** Pitted, the diminutive of foveate.
- Free.** Not joined to other organs.
- Free-central.** Said of an axile placenta standing free in the center of an ovary with one locule.
- Froned.** Leaf of a fern.
- Fruit.** The ripened pistil with all of its accessory parts.
- Fruticose.** Shrubby or shrublike, also frutescent.
- Frutescent.** Shrubby or bushy in the same sense of being woody.
- Funiculus.** The stalk by which the ovule is attached to the placenta.
- Funnelform.** Gradually widening upwards, like a funnel.
- Fusiform.** Spindle-shaped, thickest near the middle and tapering toward each end.
- Galea.** The upper lip in certain 2-lipped corollas, as in *Castilleja*.
- Galeate.** Hollow and vaulted, as in many lipped corollas.
- Gametophyte.** The gamete-bearing generation in the alternation of generations (see sporophyte); greatly reduced in seed plants.
- Gamopetalous.** Corolla with petals united; also sympetalous.
- Gamosepalous.** Calyx with united sepals; also synsepalous.

- Geniculate.** Abruptly bent.
- Genome.** The chromosome complement.
- Genus** (pl. genera). A grouping usually consisting of two or more closely related species (less commonly a single species) marked by morphological and often other distinctions from other genera in a family.
- Gibbous.** Swollen on one side; ventricose.
- Glabrate.** Becoming glabrous in age.
- Glabrous.** Without hairs.
- Gland.** A depression, protuberance, or appendage which secretes a usually sticky fluid.
- Glandular.** Bearing glands.
- Glaucouscent.** Slightly glaucous; becoming glaucous.
- Glaucous.** Covered or whitened with a bloom, as a cabbage leaf.
- Globose.** Spherical or nearly so.
- Glochid.** A barbed hair or bristle.
- Glochidiate.** Pubescent with barbed prickles or heads.
- Glomerate.** Densely compacted in clusters.
- Glomerulate.** Arranged in small, compact clusters.
- Glomerule.** A compact capitate cyme.
- Glume.** A chaffy bract; especially one of the pair of bracts at the base of a grass spikelet.
- Glutinous.** Sticky; with a sticky exudation.
- Graduate.** Marked with small regular distances.
- Granular.** Covered with very small grains or granules; minutely mealy.
- Gymnosperm.** A cone-bearing vascular plant, e.g., a conifer.
- Gynaeceandrous.** Having staminate and pistillate flowers in the same spikelet, the latter above the former.
- Gynandrium.** A column bearing stamens and pistils.
- Gynandrous.** Stamens adnate to the pistil.
- Gynobase.** An elongation of the receptacle supporting the pistil(s) or nutlets, as in the Boraginaceae.
- Gynoeceum.** Collectively, the pistils of a flower.
- Gynophore.** The stalk of the pistil of receptacular origin, as in some *Astragalus* species.
- Habit.** General appearance of a plant.
- Habitat.** The part of the environment where a plant grows.
- Halophyte.** A plant adapted to salty soil.
- Hanging garden.** A vegetated, moist alcove or bedding plane in sandstone, typical of the canyons of the Colorado River.
- Hastate.** Arrowhead-shaped but with the basal lobes turned outward.
- Head.** A dense globular cluster of sessile or subsessile flowers arising from a common receptacle.
- Helicoid cyme.** A one-sided cymose inflorescence that appears to uncoil from the end, as in Boraginaceae.
- Hemi-.** Greek prefix meaning half.
- Hemispheric.** Half spherical.
- Herb.** A plant without a persistent woody stem, at least above ground.
- Herbaceous.** Pertaining to an herb; opposed to woody; having the texture or odor of a foliage leaf; dying to the ground each year.
- Herbarium.** A collection of dried plants; the place where such a collection is housed.
- Hetero-.** Greek prefix meaning unlike or different.
- Heterogamous.** Having flowers of different sex, as in many Compositae.
- Heteromorphic.** Of more than one kind or form.
- Heterosporous.** Producing spores of two kinds, microspores and megaspores.
- Hexaploid.** Having six complete sets of chromosomes per cell.
- Hilum.** A scar on a seed, as on a bean, marking the point of attachment.
- Hirsute.** Rough, with coarse, stiff hairs.
- Hirsutulous.** Minutely hirsute; hirtellous.
- Hirtellous.** Minutely hirsute.
- Hispid.** Rough, with stiff or bristly hairs.
- Hispidulous.** Minutely hispid.
- Holosericeous.** Covered with fine and silky hairs.
- Holotype.** The one specimen on which the name of a species or other taxon is based.
- Homomorphous.** All alike, as the nutlets in some Boraginaceae; having perfect flowers of only one type.
- Homonym.** A taxonomic name rejected because it duplicates a previously and validly published name at the same rank.
- Homosporous.** With spores all alike in size and shape.
- Homostylous.** With anthers and style the same length.
- Hood.** A covering; the arching upper petal in *Aconitum*.
- Host.** A plant that nourishes a parasite.
- Hyaline.** Translucent, when viewed in transmitted light.
- Hybrid.** A cross between two species, subspecies, varieties, or genera.
- Hydrophyte.** An aquatic or water plant.
- Hypanthium.** A cup-shaped structure on which the calyx, corolla, and often the stamens are inserted; in perigyny, the "calyx tube".
- Hypocotyl.** The axis of a plant embryo or seedling below the cotyledon.
- Hypogeous.** Growing or living below the surface of the ground.
- Hypogynous.** Borne on the receptacle below or free of the pistil, as with sepals, petals, and stamens.
- Igneous.** Specifically, formed by volcanic action or intense heat, as with igneous rock.
- Imbricate.** Overlapping as shingles on a roof.
- Immersed.** Growing under water.
- Imparipinnate.** Unequally pinnate; odd-pinnate.
- Ineised.** Cut more or less deeply and sharply, intermediate between toothed and lobed.
- Included.** Not protruding beyond the surrounding organ or envelope.
- Incumbent.** Lying upon, as an anther against the inner face of its filament.
- Incurved.** Curved inward.
- Indehiscent.** Not splitting open at maturity.
- Indeterminate.** Not terminated absolutely, as in an inflorescence that continues to flower at the distal end of the axis.
- Indigenous.** Native to the area.
- Indurate.** Hardened.
- Indusium.** In ferns, the epidermal outgrowth that covers or invests the sorus.
- Inferior.** Lower or beneath, as with the ovary when it is below the other parts of a flower.
- Inflated.** Blown up; bladdery.
- Inflorescence.** The flower cluster of a plant.
- Infraspecific.** A taxonomic category below the rank of species, i.e., subspecies, variety, or form.
- Innate.** Borne on the apex of the support; in an anther the antithesis of adnate.
- Inrolled.** Involute; curled or curved inward.
- Inserted.** Attached to or growing upon.

- Integument.** The outer covering of an ovule.
- Intercostal.** Between the ribs or nerves.
- Internode.** The portion of stem between two nodes.
- Interrupted.** Not continuous.
- Introduced.** Brought in (usually purposefully) from another area.
- Introgression.** Infusion of genetic material from different taxa, resulting in intermediate hybrid progeny capable of transferring genetic material to both parental types.
- Introrse.** Faced or turned toward the axis.
- Involucl.** A secondary involucre, as the bracts subtending the secondary umbels in the Apiaceae.
- Involucre.** A whorl of bracts subtending a flower cluster, as in the heads of Compositae.
- Involute.** With the edges rolled inward toward the upper side; not revolute.
- Irregular.** Showing a lack of uniformity; bilaterally symmetric, as a zygomorphic flower.
- Isotype.** Duplicate of the holotype.
- Joint.** The node of a grass stem or cactus as in *Opuntia*.
- Jointed.** With nodes or places of real or apparent articulation.
- Keel.** A prominent dorsal ridge, analogous to the keel of a boat; the two lower united petals of a papilionaceous corolla.
- Key.** A graphic device wherein series of alternative choices are presented, the solution of which allows one to determine the name of the taxonomic rank of any unknown plant.
- Krummholz.** Literally wind-forest; the low wind-deformed forest at tree or timberline.
- Labiata.** Lipped; a member of the Labiatae.
- Lacerate.** Appearing irregularly torn or cleft.
- Laciniate.** Cut into narrow lobes or segments.
- Lamina.** The blade or expanded part of a leaf, petal, etc.
- Lanate.** Woolly; densely clothed with long entangled hairs.
- Lanceolate.** Lance-shaped; much longer than broad, tapering from below the middle to the apex and to the base.
- Lateral.** On or at the side.
- Latex.** Milky sap.
- Lax.** Loose, with component parts separated.
- Leaflet.** A segment of a compound leaf.
- Legume.** A superior 1-loculed fruit derived from a simple pistil, usually dehiscent into two valves having the seeds attached along the ventral suture; a leguminous plant.
- Lemma.** In grasses, the lower of the two bracts immediately enclosing the floret.
- Lenticels.** Corky spots on young bark, arising in relation to the epidermal stomates.
- Lenticular.** Lens-shaped.
- Lepidote.** Covered with fine scurfy scales.
- Ligneous.** Woody; of or resembling wood.
- Ligulate.** Strap-shaped; furnished with a ligule.
- Ligule.** The strap-shaped part of a ray corolla in Compositae; the thin collarlike appendage on the inside of the blade at the junction with the sheath in grasses.
- Liliopsida.** Monocotyledoneae or monocots.
- Limb.** The expanded flat part of an organ, especially the expanded part of a gamopetalous corolla.
- Linear.** Resembling a line; long and narrow, of uniform width, as the leaf blades of grasses.
- Lip.** One of two segments of an irregular corolla or calyx, as in many Labiatae; a labium.
- Lobe.** A division or segment of an organ, as of a leaf.
- Lobulate.** Made up of lobules.
- Lobule.** A small lobe.
- Locally abundant.** Abundant where found, but not occurring uniformly.
- Locule.** The "cell" or cavity of an organ, applied to pistils and stamens.
- Loculicidal.** Dehiscent longitudinally through the middle of the back of a pericarp, directly into the locule.
- Lodicule.** Paired rudiments at the base of the ovary in grass flowers, which spread the palea and lemma by swelling at anthesis.
- Loment.** A legume which is constricted between the seeds.
- Longitudinal.** Along the long axis.
- Lyrate.** Lyre-shaped; pinnatifid, with the terminal lobe large and rounded, the lower lobes small.
- Machaerantheroid.** With squarrose or recurved type on involuclral bracts, as in *Machaeranthera*.
- Macro-.** Greek prefix meaning large or long.
- Macrophyll.** A large leaf, as the complex, usually few- to many-veined leaves of higher vascular plants; see microphyll.
- Macrosporangium.** The organ in which macrospores are produced; see megasporangium.
- Macrospore.** The larger of two kinds of spores in Selaginellaceae; see megaspore.
- Macrosporophyll.** The modified leaf that bears the macrosporangium; see megasporophyll.
- Maculate.** Blotched or spotted.
- Magnoliopsida.** Dicotyledoneae or dicots.
- Malpighian hair.** Straight appressed hairs attached above the base and tapering to the free tips; pick-shaped.
- Mammillate.** Having nipples, or nipplelike protruberances.
- Marcrescent.** Withering without falling off, as the persistent leaves at the bases of some plants.
- Marginate.** Distinctly margined.
- Medial.** Of the middle.
- Megasporangium.** The spore case bearing the megaspore.
- Megaspore.** A synonym of macrospore; the female spore.
- Megasporophyll.** A fertile, modified leaf bearing the megasporangium; a carpel.
- Membranous.** Of the nature of a membrane; thin, soft, and pliable.
- merous.** A suffix denoting parts or numbers, as 3-merous.
- Mericaip.** A portion of a schizocarp, as in Umbelliferae.
- Mesocarp.** The middle layer or coat of a fruit.
- Mesophyte.** A plant growing where moisture conditions are moderate.
- Micro-.** Greek prefix meaning small.
- Microphyll.** A small leaf, as the simple, usually 1-veined leaves of *Lycophyta* and *Equisetophyta*.
- Microsporangium.** The organ producing microspores.
- Microspore.** The smaller of the two kinds of spores, as in Selaginellaceae; the male spore.
- Microsporophyll.** A fertile leaf bearing microsporangia; a stamen.
- Midrib.** The central rib of a leaf or other organ.
- Monadelphous.** Stamens united by their filaments into a tube surrounding the gynoecium, as in malvaceous flowers.

- Monocarpic.** Bearing fruit but once and then dying; an annual or biennial.
- Monoclinous.** Having stamens and pistils in the same flower.
- Monocotyledon.** Plant group with one seed leaf; Liliopsida.
- Monocious.** Having staminate and pistillate flowers on the same plant, but not perfect ones.
- Monotypic.** Having one representative, as a family with one genus.
- Montane.** Growing in the mountains.
- Moraines.** A mass of rocks, gravels, or sand deposited by a glacier at the terminal end or along the sides.
- Mottled.** Marked with colored spots.
- Mucilaginous.** Moist and viscid; slimy; composed of mucilage.
- Mucro.** A small and short abrupt tip of an organ.
- Mucronate.** Possessing a short and straight point (mucro), as some leaves.
- Multi-.** Latin prefix, meaning many.
- Multifid.** Cleft into many narrow lobes or segments.
- Muricate.** Rough with short and firm sharp excrescences.
- Naked.** Nude.
- Naturalized.** Said of plants introduced from elsewhere but now established.
- Nectariferous.** Having nectar.
- Nectary.** An organ which secretes nectar.
- Nerve.** A simple vein or slender rib of a leaf or bract.
- Neuter.** Lacking functional stamens or gynoecium.
- Nocturnal.** Opening at night, as in flowers of *Oenothera*.
- Node.** The joint of a stem; the point of insertion of a leaf or leaves.
- Nodding.** Bent to one side.
- Nodulose.** Having minute nodules; finely knobby.
- Nut.** A hard, indehiscent, usually 1-seeded fruit, produced from a compound ovary.
- Nutlet.** A small nut.
- Ob-.** A Latin prefix usually signifying inversion.
- Obconic.** Conical, but attached at the narrower end.
- Obcordate.** Inversely cordate.
- Ob lanceolate.** Inversely lanceolate.
- Oblique.** With unequal sides, slanting.
- Oblong.** Much longer than broad, with nearly parallel sides.
- Obovate.** Shaped like the longitudinal section of an egg, but with the broadest part toward the tip.
- Obovoid.** Inversely ovoid.
- Obsolete.** Rudimentary or not evident, as an organ that is almost entirely suppressed; vestigial.
- Obtuse.** Blunt to almost rounded at the end.
- Ocrea.** A sheath around the stem derived from the stipules; chiefly in the Polygonaceae.
- Odd-pinnate.** Having a terminal leaflet instead of a tendril or pair of leaflets.
- Odoriferous.** Having an odor.
- Operculum.** A lid, as with the deciduous cap of a circumscissile fruit.
- Opposite.** Set against, as leaves when two at a node; one part in front of another, as a stamen in front of a petal.
- Orbicular.** Approximately circular in outline.
- Orchroleucous.** Yellowish white.
- Orifice.** The mouthlike opening of a tubular corolla at the tube opening.
- Outcross.** To exchange pollen with other plants; opposite of selfing.
- Oval.** Broadly elliptic.
- Ovary.** The part of the pistil that contains the ovules.
- Ovate.** With the outline of an egg in longitudinal section, the broadest end downward.
- Ovoid.** Egg-shaped.
- Ovule.** The megasporangium and associated integuments of a seed plant; the part within an ovary that becomes a seed.
- Ovuliferous.** Bearing ovules.
- Palate.** An appendage in the throat of an irregular flower partly or completely closing the throat.
- Palea.** One of the chafflike scales on the receptacle of many Compositae; the inner bract off a grass floret, often partly surrounded by the lemma.
- Paleaceous.** Covered with or resembling chaffy scales.
- Palmate.** Lobed or veined where the branches arise from a common point, like the fingers of a hand.
- Palmatifid.** Palmately lobed or cleft.
- Pandurate.** Fiddle-shaped.
- Panicle (adj. paniculate).** A compound racemose inflorescence; (said of such inflorescences).
- Papilionaceous.** Applied to the butterflylike corolla of the pea, with banner, wings, and keel.
- Papillae.** Soft superficial glands or protuberances.
- Papillate.** Having papillae.
- Pappillose.** Bearing minute rounded or swollen projections.
- Pappose.** Pappus-bearing.
- Pappus.** The modified calyx limb on Compositae, consisting of a crown of bristles or scales at the summit of the achene.
- Parallel veined.** With veins parallel with the leaf axis, or arising from the midrib and parallel to each other to the margin.
- Parasite.** An organism that uses energy or water at the expense of another organism (the host).
- Parietal.** Attached to the wall of the ovary, instead of to the axis.
- Parted.** Deeply cleft nearly to the base.
- Pectinate.** With narrow closely set divisions like the teeth of a comb.
- Pedate.** Palmate, with the lateral lobes 2-cleft.
- Pedicel.** The stalk of a single flower in a flower cluster, or of a spikelet in grasses.
- Pedicellate.** Having a pedicel, as in many flowers.
- Peduncle.** The stalk of a flower or of a flower cluster.
- Pedunculate.** Having a peduncle, as a flower cluster.
- Pellucid.** Clear, transparent or nearly so.
- Peltate.** Shield-shaped; a flat body having a stalk attached to the lower surface instead of at the base or margin.
- Pendulous.** Hanging downward; pendent.
- Pepo.** An indehiscent, fleshy, 1-loculed or falsely 3-loculed, many-seeded berry, usually with a hard rind, as in the cucumber.
- Perennate.** To renew itself, as with lateral shoots from a caudex.
- Perennial.** Of three or more years duration.
- Perfect.** A flower having both stamens and pistils.
- Perfoliate.** With the leaf entirely surrounding the stem.
- Perforate.** With holes (see *Thysanocarpus curvipes* Cruciferae).
- Prianth.** The floral envelopes; collectively, the calyx and corolla, especially when they are alike.
- Pericarp.** The ripened walls of the ovary, referring to the fruit.

- Perigynium** (pl. perigynia). The scalelike organ surrounding the pistil in *Carex*.
- Perigynous**. Borne around the ovary in contrast to beneath it, as when the stamens, corolla, and sepals are inserted on the floral tube.
- Pernicious**. Highly injurious or destructive in character; deadly.
- Persistent**. Remaining attached, as a calyx on the fruit.
- Petal**. One of the second whorl of floral parts or parts of a corolla, usually colored.
- Petaloid**. Resembling a petal.
- Petiole**. A leaf stalk.
- Petiolule**. The petiole of a leaflet of a compound leaf.
- Phloem**. The usually food conductive tissue; bark.
- Phyllode**. A leaflike petiole with no blade, as in some *Astragalus* species.
- Pilose**. Bearing soft and straight hairs.
- Pilosulose**. Bearing very small, soft, straight hairs.
- Pinna** (pl. pinnae). A leaflet or primary division of a pinnate leaf.
- Pinnate**. A compound leaf, having leaflets arranged on each side of a common petiole; featherlike.
- Pinnatifid**. Pinnately cleft into narrow lobes not reaching the midrib.
- Pinnatisect**. Pinnately cut to the midrib.
- Pinnule**. The secondary pinna, as in thrice compound leaves of ferns.
- Pistil**. The ovule-bearing organ of a flower, consisting of stigma and ovary, usually with a style between; gynoecium; a megasporophyll.
- Pistillate**. Provided with pistils and without stamens; female (carpellate).
- Pith**. The parenchymatous tissue in the stem center in Magnoliopsida.
- Pitted**. Having small pits or depressions.
- Placenta** (pl. placentae). The ovule-bearing part of an ovary.
- Placentation**. The arrangement or orientation of the placenta.
- Plano-convex**. Flat on one side and convex on the other.
- Plicate**. Plaited; folded as a fan.
- Plumbeous**. Lead-colored.
- Plumose**. Feathery; having fine hairs on each side as a plume.
- Pluricipital**. Many headed, as in a branched caudex.
- Pod**. Any dry, dehiscent fruit, especially a legume.
- Pollen**. The male microspores of seed plants located in the anther.
- Pollinium** (pl. pollinia). The pollen masses of the orchids and milkweeds.
- Poly-**. Greek prefix, meaning many.
- Polychrome**. Many colored.
- Polygamous**. Bearing unisexual and bisexual flowers on the same plant.
- Polymorphic**. Of many forms.
- Polypetalous**. With a corolla of separate petals.
- Polyploid**. With three or more sets of chromosomes in each cell.
- Pome**. A fleshy fruit made up mostly of a modified floral tube, an apple, pear, or haw.
- Poricidal**. Opening by means of pores, as in the capsules of poppies.
- Porrect**. Like a parrot beak.
- Posterior**. On the side toward the axis; the upper side of the flower; at or toward the back.
- Precocious**. Flowering before the leaves appear.
- Prickle**. Sharp outgrowth of the bark or epidermis.
- Primary**. First.
- Primary leaflet**. The apical leaflet; the only one produced on some early leaves.
- Procumbent**. Trailing on the ground, but not rooting.
- Proliferous**. Bearing offshoots or bulblets.
- Prostrate**. Lying flat upon the ground.
- Pruinose**. Having a waxy powdery surface; covered with whitish dust or bloom.
- Prothallus**. The gametophyte in the alternation of generations (see sporophyte), especially in ferns.
- Psammophyte**. A plant growing in sand.
- Pseudoscape**. A false scape, as in a tulip where not all leaves are basal.
- Puberulent**. Minutely pubescent.
- Pubescent**. Covered with short, soft hairs; downy.
- Pulvinate**. Cushion-shaped.
- Pulvinus** (pl. pulvini). An enlargement at a leaf or leaflet base.
- Punctate**. Dotted with punctures or with translucent pitted glands or with colored dots.
- Pungent**. Ending in a rigid, sharp point or prickle; acrid (flavor).
- Pustulate**. Bearing irregular blisterlike swellings or pustules, mostly at the bases of hairs.
- Pyramidal**. Shaped like a pyramid.
- Pyriform**. Pear-shaped.
- Pyxis**. A capsule whose top comes off as a lid.
- Raceme**. A simple, elongated, indeterminate inflorescence with each flower subequally pedicelled.
- Racemose**. Having racemes; racemelike.
- Rachilla**. A small rachis, specifically the axis of a grass spikelet.
- Rachis**. The axis of a spike or raceme or of a compound leaf.
- Radiate**. Spreading from a common center; bearing rays.
- Radical**. Pertaining to roots.
- Radicle**. That portion of the embryo below the cotyledons.
- Raphe**. A ridge along the side of a seed adjacent to the hilum.
- Ray**. A primary branch of an umbel; in Compositae, the ligule of a ray flower.
- Receptacle**. That portion of the floral axis upon which the flower parts are borne; in Compositae, that which bears the flowers in the head.
- Recurved**. Curved backward or downward.
- Reduced**. With parts diminished; diminished.
- Reflexed**. Bent downward.
- Regular**. Said of a flower having radial symmetry, with the parts in each series alike.
- Relict**. A species with a disjunct distribution left over from an earlier geological period.
- Remote**. Distantly spaced.
- Reniform**. Kidney-shaped.
- Repand**. With an undulating margin, less strongly wavy than sinuate.
- Repent**. Prostrate and rooting.
- Replicate**. Folded backward.
- Replum**. Partition between the two locules of siliques or silielae; see Cruciferae.
- Resinous**. Bearing resin.

- Reticulate.** With a network; net-veined.
- Retrorse.** Bent backward or downward.
- Retuse.** Notched shallowly at a rounded apex.
- Revolvate.** Rolled backward from both margins toward the underside.
- Rhizomatous.** Having rhizomes.
- Rhizome.** An underground stem or rootstock, with scales, leaves, and buds at the nodes.
- Rhombic.** Diamond-shaped.
- Rhomboidal.** Approaching a rhombic outline; quadrangular, with the lateral angles obtuse; diamond-shaped.
- Riparian.** Growing along stream banks.
- Root.** The usually below ground axis of a plant, lacking nodes, scalelike leaves, and regularly placed buds.
- Rosette.** A crowded cluster of radiating leaves arising from a shortened stem at or near ground level.
- Rostrate.** With a short, stout beak.
- Rosulate.** With a collection of clustered leaves; a rosette.
- Rotate.** Wheel-shaped; said of a sympetalous corolla with obsolete tube and with a flat and circular limb.
- Rotund.** Rounded in outline.
- Rudimentary.** Imperfectly developed; vestigial.
- Rufus.** Reddish-brown in color.
- Ruga** (pl. rugae). A wrinkle or fold.
- Rugose.** Wrinkled.
- Rugulose.** Somewhat wrinkled.
- Runcinate.** Sharply pinnatifid or incised, the lobes pointing downward.
- Runner.** A slender stolon or trailing stem rooting at the nodes or tip.
- Sac.** The cavity of an anther.
- Saccate.** Bag-shaped.
- Sagittate.** Arrowhead-shaped, with the basal lobes turned downward.
- Salverform.** A corolla with slender tube, abruptly expanding into a flat limb, as in *Phlox*.
- Samara.** An indehiscent, winged fruit.
- Saprophyte.** A plant living on dead organic matter, without chlorophyll and not parasitic.
- Scaberulose.** Intermediate between scabrous and minutely pilose.
- Scabrid.** Minutely scabrous.
- Scabrous.** Rough to the touch, owing to the structure of the epidermis or to the presence of short stiff hairs.
- Scale.** Any thin, scarious bract, usually a vestigial leaf.
- Scandent.** Climbing.
- Scape.** A leafless peduncle rising from the ground in acaulescent plants.
- Scapose.** With the flowers borne on a scape.
- Scarious.** Thin, dry, and membranous, not green.
- Schizocarp.** An indehiscent fruit that splits at maturity into two or more one-seeded segments (mericarps).
- Scorpioid.** A one-sided inflorescence with a circinate coiled axis like a scorpion's tail.
- Scurfy.** Clothed with small branlike scales.
- Secondary leaflet.** The leaflet below the terminal one.
- Secund.** Arranged on one side only; unilateral.
- Seed.** The ripened ovule; the integuments, embryo, and endosperm (when present).
- Seep.** A moist location where underground water comes to the surface.
- Segment.** A division or part of a leaf or other organ.
- Segregate.** To separate.
- Seleniferous.** Bearing selenium.
- Selenophyte.** A plant that takes up selenium from the soil, and typically grows only on selenium bearing soils.
- Semi-** (prefix). Literally half but used as meaning partly or nearly.
- Sepal.** A segment of a calyx, or a segment of a perianth where only one whorl is present.
- Sepaloid.** Sepallike.
- Septicidal.** Dehiscence of a capsule through the septa and between the locules.
- Septate.** Bearing septae or partitions.
- Septum.** A partition between the cavities, as in an ovary.
- Seriate.** Disposed in rows.
- Sericeous.** Silky with long, slender, soft, more or less appressed hairs.
- Serotinous.** Late coming; late to leaf, flower, or appear.
- Serrate.** Saw-toothed, the sharp teeth pointed forward.
- Serrulate.** Minutely serrate.
- Sessile.** Attached directly by the base, not stalked, as a leaf without a petiole.
- Seta.** (pl. setae) A bristle.
- Setose.** Beset with bristles.
- Sheath.** The tubular basal part of the leaf that encloses the stem, as in the grasses and sedges.
- Sheathing.** Enclosed with a sheath, as the sheath of a grass leaf that surrounds the stem.
- Shrub.** A woody plant smaller than a tree and with several to many stems.
- Sigmoid.** Doubly curved, as in the letter S; S-shaped.
- Silicle.** A short silique, typically less than twice as long as wide.
- Silique.** A many-seeded capsule of the Cruciferae, with two valves splitting from the bottom and leaving the placenta with the false partition (replum) between them, typically more than twice as long as wide.
- Silky.** Like covered with silk; sericeous.
- Simple.** Unbranched, as a stem or hair; not compound, as a leaf; single, as a pistil of one carpel.
- Sinuate.** With a strongly wavy margin.
- Sinuuous.** Sinuate, with a deeply wavy margin.
- Sinus.** The cleft or recess between two lobes of an expanded organ such as a leaf.
- Smooth.** Not rough to the touch.
- Soboliferous.** Bearing sobols; elongate caudex branches.
- Solitary.** Alone, borne singly.
- Sonoran habitat.** Warm to hot desert habitat, as at St. George, Washington County.
- Sordid.** Of a dull or dirty hue.
- Sorus** (pl. sori). The fertile portion of a fern frond; the place where sporangia are borne.
- Spathaceous.** Spathe bearing; like a spathe.
- Spathe.** A bract or pair of bracts enclosing a flower cluster.
- Spatulate.** Like a spatula, a blade rounded above and gradually tapering to the base.
- Species.** An agglomeration of related individuals with a similar mode of reproduction at a given point of time.
- Spicate.** Having the form of or arranged in a spike.
- Spike.** An elongated rachis of sessile flowers or spikelets.
- Spikelet.** A secondary spike; the ultimate flower cluster in grasses, consisting of two glumes and one or more florets, also in sedges.
- Spine.** A sharp-pointed, stiff, woody body, arising from below the epidermis; commonly the counterpart of a stipule.
- Spinulose.** Having spinules.

- Sporangium** (pl. sporangia). A spore case or sac.
- Spore**. A reproductive cell, typically haploid, resulting from meiotic cell division in specialized reproductive structures (sporangia).
- Sporocarp**. The receptacle containing sporangia or spores.
- Sporophyll**. A spore-bearing leaf.
- Sporophyte**. The spore-bearing generation in alternation of generations (see gametophyte), the usual plant seen in seed plants, ferns, and other vascular plants.
- Spreading**. Diverging almost to the horizontal; nearly prostrate.
- Spur**. A slender, saclike, nectariferous process from a petal or sepal.
- Squama**. A scale, as applied to some types of pappus in the Compositae.
- Squarrose**. Rough or scurfy with spreading and outstanding processes; recurved at the tips, as the involucrel of bracts (see machaeranthroid).
- Stalk**. The stem of an organ.
- Stamen**. The male organ of the flower that bears pollen; the microsporophyll.
- Staminate**. Having stamens but not pistils; said of a flower or plant that is male, hence not seed-bearing.
- Staminode**. A sterile stamen, or what corresponds to a stamen.
- Standard**. Banner or uppermost petal in leguminous flowers.
- Stellate**. Star-shaped.
- Stem**. The usually above ground axis of a plant bearing nodes, leaves, end buds.
- Sterile**. Infertile or barren, as a stamen lacking an anther.
- Stigma**. The receptive part of the pistil on which the pollen germinates.
- Stipe**. The stalk beneath an ovary that is inserted upon the receptacle (see gynophore).
- Stipel**. The stipule of a leaflet.
- Stipitate**. With a stipe or stalk.
- Stipulate**. Bearing stipules.
- Stipule**. One of the pair of usually foliaceous appendages found at the base of the petiole in many plants.
- Stolon**. A modified stem bending over and rooting at the tip or creeping and rooting at the nodes; a horizontal stem that gives rise to a new plant at its tip.
- Stoloniferous**. Having stolons.
- Stomate**. A breathing pore or aperture in the epidermis.
- Stone**. The hardened, bony endocarp of a drupe enclosing the seed.
- Stramineous**. Strawlike as color or terture.
- Striate**. Marked with fine longitudinal lines or furrows.
- Strict**. Very straight and upright, not at all lax or spreading.
- Strigillose**. Minutely strigose.
- Strigose**. Clothed with sharp and stiff appressed straight hairs.
- Strigulose**. Intermediate between strigose and pilose.
- Strobilus**. Conelike aggregation of sporophylls; a cone.
- Style**. The contracted portion of the pistil between the ovary and the stigma.
- Stylopodium**. An enlargement or disklike expansion at the base of the style as in the Apiaceae.
- Sub-**. A prefix usually signifying somewhat, slightly, rather, or almost.
- Submersed**. Submerged.
- Subspecies**. A unit of classification below the rank of species consisting of two or more varieties.
- Subtend**. To be below and close to, as the leaf subtends the shoot borne in its axis.
- Subulate**. Awl-shaped.
- Succulent**. Juicy; fleshy (and sometimes soft).
- Suffrutescent**. Obscurely shrubby; very slightly woody, but not necessarily low.
- Suffruticose**. Woody; diminutively shrubby.
- Sulcate**. Longitudinally grooved, furrowed, or channeled.
- Superior**. Growing above, as an ovary that is free from the other floral organs.
- Suture**. The line of dehiscence of fruits or anthers; the line of a natural union or division between coherent parts.
- Syconium**. Fruit of a fig; inflorescence with inverted hollow receptacle bearing flowers internally, the whole ripening.
- Symmetric**. Said of a flower having the same number of parts in each circle.
- Sympatric**. Growing together, or having the same distribution.
- Sympetalous**. With petals united in a one-piece corolla; gamopetalous.
- Syn-**. Greek prefix, meaning united.
- Synonym**. An outmoded systematic name, as with a species published superflously.
- Talus**. The accumulation of detritus, usually boulders and smaller particles.
- Taproot**. The primary root from which smaller secondary roots originate.
- Tawny**. Dull brownish yellow.
- Taxa**. Two or more taxonomic entities as with two species.
- Taxon**. Any taxonomic entity, division, class, order, genus, species, etc.
- Taxonomy**. Classification; principals of classification.
- Tendrill**. A slender, coiling or twining organ by which a climbing plant grasps its support.
- Tepals**. A segment of a perianth, either sepal or petal, as in the Polygonaceae.
- Terete**. Cylindric; round in cross section.
- Ternate**. In 3's, as a leaf consisting of three leaflets.
- Terrestrial**. Growing on ground as opposed to in water; not aquatic.
- Tesselate**. Checkered.
- Testa**. The outer seed coat.
- Tetradynamous**. Having four long and two short stamens.
- Tetraploid**. With four complete sets of chromosomes in a nucleus; a plant with such a condition.
- Thorn**. A short, hard, woody, modified stem with a sharp point.
- Throat**. The orifice of a gamopetalous corolla; the expanded portion between the limb and tube proper.
- Thyrse**. A compact, ovate panicle; strictly, a panicle with the main axis indeterminate, but other axes cymose.
- Tomentose**. With tomentum; covered with a rather short, densely matted, soft white wool.
- Tomentulose**. Slightly tomentose.
- Tomentum**. A cobwebby covering of hairs.
- Tooth**. Any small marginal lobe.
- Torose**. With swellings at intervals.
- Tortuous**. Bent or twisted in different directions.

- Torulose.** Constricted between the seeds.
- Tracheophyta.** The vascular plants.
- Trailing.** Creeping, said of plants with weak very long stems, as in *Convolvulus*.
- Translucent.** Nearly transparent.
- Transverse.** At a right angle (across) to the longitudinal axis.
- Tree.** A woody perennial usually with a single main trunk or stem.
- Tri-.** Prefix, meaning three as in trifoliate (with three leaflets).
- Tribe.** Subdivision of a family.
- Trichome.** A hair.
- Trichotomous.** Three-forked.
- Tridentate.** Three-toothed.
- Trifid.** Three-cleft to about the middle.
- Trifoliate.** With three leaflets.
- Trigonous.** Three-angled.
- Tripartite.** Three-parted.
- Triquetrous.** Three-edged.
- Trifernate.** Thrice or three times ternate.
- Truncate.** As if cut squarely at the end.
- Tube.** A hollow structure, as in the fused (lower) part of a united corolla or calyx.
- Tuber.** A thickened, solid, short underground stem with nodes bearing buds.
- Tubercle.** A small tuberlike prominence or nodule; the persistent base of the style in some Cyperaceae.
- Tuberculate.** Bearing tubercles.
- Tuberous.** Producing or resembling a tuber.
- Tubular.** Shaped like a tube or cylinder.
- Tufted.** In tufts; caespitose.
- Turbinate.** Top-shaped.
- Turgid.** Swollen; inflated.
- Turions.** Winter buds or over wintering young shoots, as in *Epilobium*.
- Type** (type specimen). The specimen on which the name of a plant is based.
- Umbel.** A flat or convex flower cluster in which the pedicels arise from a common point, like the rays of an umbrella.
- Umbellate.** In umbels, or appearing as if an umbel.
- Uncinate.** Hooked at the tip.
- Undulate.** Wavy; repand; with less pronounced waves than sinuate.
- Unguiculate.** Clawed.
- Unilateral.** One-sided, or turned to one side of an axis; secund.
- Uni-.** Latin prefix, meaning one.
- Unilocular.** With a single cavity or compartment, as in many fruits.
- Unisexual.** Male or female but not both, as in a staminate (male) flower.
- Urceolate.** Pitcherlike; hollow and contracted at the mouth like an urn or pitcher.
- Urn-shaped.** Like an urn; pitcher-shaped.
- Utricle.** A small, bladderly, 1-seeded usually indehiscent fruit.
- Vaginate.** Sheathed.
- Valvate.** Opening by valves, as in most dehiscent fruits and some anthers.
- Valve.** One of the segments into which a dehiscent capsule or legume separates.
- Variety.** A taxonomic subunit of a species or subspecies.
- Vascular.** Conductive; with conductive tissue (i.e., xylem and phloem).
- Vascular plant.** A plant with xylem and phloem.
- Vein.** A vascular bundle of a leaf or other flat organ.
- Velum.** The membranous indusium (covering) in the genus *Isoetes*.
- Velutinous.** Velvety.
- Venation.** The arrangement of the veins of a leaf; nervation.
- Ventral.** Relating to the inward surface of an organ, in relation to the axis, as in the usually upper surface of a leaf.
- Ventricose.** Swollen or inflated on one side, as in some corollas.
- Vernal.** Spring; as opposed to autumnal.
- Vernation.** The arrangement of foliage leaves within the bud.
- Verrucose.** Warty.
- Versatile.** An anther attached near the middle.
- Verticil.** A whorl, or circular arrangement of similar parts about the same point on an axis.
- Verticillate.** Whorled; arranged in whorls.
- Vespertine.** Opening in the evening.
- Vestigial.** Reduced to a vestige, or trace of a part or organ at one time more perfectly formed.
- Villosulose.** Diminutive of villous.
- Villous.** Bearing long, soft, and unmatted hairs; shaggy.
- Virgate.** Wandlike, erect and straight.
- Viscid.** Sticky; glutinous.
- Viviparous.** Forming bulblets in the inflorescence.
- Weed.** A plant with aggressive tendencies, the product or beneficiary of mans agriculture.
- Whorl.** A ring of similar organs radiating from a node; a verticil.
- Wing.** A thin, usually dry extension bordering an organ; a lateral petal of a papilionaceous flower.
- Winter annual.** A plant whose seed germinates in late summer or autumn and completes flowering and fruiting before dying in late spring or summer of the year following.
- Woolly.** Having long, soft, entangled hairs; lanate.
- Xeric.** Of dry places.
- Xerophyte.** A plant adapted to live in dry areas, such as desert plants.
- Xylem.** The usually dead water conducting cells (vessels or trachieds); wood.
- Zygomorphic.** Bilaterally symmetric; that which can be bisected only in one plane into similar halves.
